End_Table

Going Into a True Sleep Mode (No Power)

=====

Here is one method you can use to have the display go into a true sleep mode (no power).

Step 1

Open the Energy Saver control panel

Step 2

Set the System sleep option to the minimum value (30 minutes).

Step 3

If you want the display to go into a low-power sleep mode (loss of video only) then select display sleep and set the time for under 30 minutes. If you want the display to go into a true sleep mode (loss of power), deselect display sleep and have the system sleep set at 30 minutes or greater. If you have an option for never, all three options for sleep including the display are set for never.

Step 4

Close the Energy Saver control panel

The CPU sleep blanks all Video, Horizontal and Vertical Sync, and Composite Sync. With the display sleep function selected and set at under 30 minutes, you only loose video and Composite sync. Until the CPU goes to sleep the display will not loose power.

Apple Printer Utility 2.0: Isn't Compat W/ Telecom 2.3.3 (7/96)

Revised: 7/18/96
Security: Everyone

Apple Printer Utility 2.0: Isn't Compat W/ Telecom 2.3.3 (7/96)

=====

Article Created: 18 July 1996

TOPIC -----

When I try using the Apple Printer Utility 2.0 with my LaserWriter printer from my Power Macintosh Computer, my system "freezes" upon shut down, or restart.

I have narrowed this down to the Telecom 2.3.3 software. If I do not install this software after reinstalling System 7.5.3, then everything works as it should.

DISCUSSION -----

We duplicated the problem using the Apple Telephone Tool v2.3.3 with Apple Printer Utility v2.0 under Mac OS 7.5.3, when the Macintosh was connected to the network using LocalTalk. When we tested the software using EtherTalk, we did not encounter any difficulties.

After sending or receiving a fax with the Apple Telephone Tool using a GeoPort Adapter, you may encounter system hangs when using the Apple Printer Utility, or after using the Apple Printer Utility when you Restart or Shut Down. Even if you disable the Apple Telephone Tool and fax extensions using the Extensions Manager, and restart your Macintosh, you may still encounter hangs after using Apple Printer Utility.

Until this problem is isolated and fixed, when you are using a LocalTalk network connection, you should refrain from using the Apple Printer Utility and the Apple Telephone tool when using LocalTalk on the same Macintosh computers using Mac OS 7.5.2 or 7.5.3.

PC Compatibility Card: Create New Drive Containers (7/96)

Revised: 7/19/96
Security: Everyone

PC Compatibility Card: Create New Drive Containers (7/96)

=====

Article Created: 19 July 1996

TOPIC -----

I have a PCI-based PC Compatibility Card, and I am having trouble trying to use the drive container from one of the earlier DOS Compatibility Card I had installed in my Power Macintosh 6100 computer. Can I use my previous drive containers?

DISCUSSION -----

The PCI-based PC Compatibility Cards have significant hardware differences from the earlier DOS Compatibility Cards. Although the drive containers have not changed, many of the previous drivers, including video drivers and sound drivers, will not work correctly on the PCI-based PC Compatibility Cards.

To ensure proper operation of the PCI-based PC Compatibility Cards, you should create a new drive container and install the drivers that come with the PC Compatibility Card.

AppleCD Audio Player: Volume Setting Aren't Retained (7/96)

Revised: 7/19/96
Security: Everyone

AppleCD Audio Player: Volume Setting Aren't Retained (7/96)

=====

Article Created: 19 July 1996

TOPIC -----

I am using the AppleCD Audio Player v2.1, which came with System 7.5.3 Update 2.0, and cannot find a way to make the AppleCD Audio Player retain the volume settings after I restart my Macintosh computer.

DISCUSSION -----

This issue has been reported to Apple Engineering and they are investigating a solution. Currently the only solution is to reset the volume slider to the desired position.

When you restart your Macintosh the AppleCD Audio Player v2.1 slider defaults to the middle position, so you must manually change the volume each time you use the AppleCD Audio Player.

Power Mac 5200 & 6300: PrinterShare Fails From Remote (11/96)

Revised: 11/22/96
Security: Everyone

Power Mac 5200 & 6300: PrinterShare Fails From Remote (11/96)

=====

Article Created: 19 July 1996
Article Reviewed/Updated: 22 November 1996

TOPIC -----

I have two Power Macintosh 5200 computers and a Color StyleWriter 2500 printer. I am trying to share the printer, but when I print from the remote computer, I get a Resource not Found error message. I am using System 7.5.3 on both computers.

DISCUSSION -----

You can perform any of the workarounds listed below in order to print correctly. This problem is NOT specific to the Color StyleWriter 2500, and occurs with any QuickDraw printer that uses Printer Share 1.1.3.

Workarounds
=====

Upgrade to System 7.5.5

You can successfully use PrintShare on Power Macintosh 5200 and Power Macintosh 6300 series computers if you install the System 7.5.5 update.

Fill Out Information in Sharing Setup Control Panel

If you fill out the information in the Sharing Setup control panel, the necessary resources are installed, so PrintShare functions properly with System 7.5.3. Be sure to fill out the information in the Sharing Setup control panel of the remote computer also.

This article appeared in the 15 October 1996 issue of the Information Alley.

Article Change History:

22 Nov 1996 - Added Sharing Setup control panel on the remote computer.

15 Oct 1996 - Added current workarounds.

StyleWriter GX Drivers: Don't Support Scatter Feature (7/96)

Revised: 7/19/96
Security: Everyone

StyleWriter GX Drivers: Don't Support Scatter Feature (7/96)

=====

Article Created: 19 July 1996

TOPIC -----

I am using QuickDraw GX and a Color StyleWriter 1500 printer. I am trying to use the Scatter mode, but that button is not active. How can I use this color mode with QuickDraw GX?

DISCUSSION -----

The StyleWriter GX drivers do not support the scatter feature, with the exception of the StyleWriter Pro GX driver. Since most StyleWriter customers do not need the higher end printing architecture of QuickDraw GX, many of the features of GX, such as DeskTop printing, N-Up and Watermarks, have been incorporated into the standard QuickDraw drivers.

User & Group Manager: Thread Manager Missing (8/96)

=====

Article Created: 23 July 1996
Article Reviewed/Updated: 1 August 1996

TOPIC -----

I installed the FirstClass, AppleShare, and AtEase Agent software on one server. I then moved the FirstClass Agent extension to my FirstClass server so I could access the server with the User & Group Manager. I now get a message upon restart of the server that I need to "install the Thread Manager extension".

DISCUSSION -----

You will get this message if you drag copy the FirstClass Agent extension into your server's system folder. In the first chapter of the Network Administrator Toolkit (ANAT) manual it states:

WARNING: Do not install the Network Administrator Toolkit software by dragging the files onto the startup disk. You must use the Installer programs that are on the Apple Network Administrator Toolkit CD-ROM disc. These programs place the files in the correct location on the startup disk.

You will need to install the Apple Network Administrator Toolkit Server software for the type of server you are running. The Installer will install the Thread Manager into the server's system folder.

Network Assistant: Control Window Behavior (8/96)

Revised: 8/1/96
Security: Everyone

Network Assistant: Control Window Behavior (8/96)

=====

Article Created: 23 July 1996
Article Reviewed/Updated: 1 August 1996

TOPIC -----

- 1) Should the user be getting a full screen view when trying to control a single workstation from the multiple view observation window, or is this an error in the documentation?
- 2) When you can see a partial desktop is there a way to scroll around to observe or control the entire desktop?
- 3) Can I use other applications on my computer while I am controlling another computer?
- 4) What are the requirements for the administrators monitor?
- 5) Are there any restrictions for the workstation monitor?

DISCUSSION -----

1) Question: Should the user be getting a full screen view when trying to control a single workstation from the multiple view observation window, or is this an error in the documentation?

Answer: This is not exactly wrong but rather unclear. The screen you will be controlling will fill up the 640x480 "observing" window, not the whole screen unless of course your administrators station has only a 640x480 screen. Then the statement in the manual would be true.

2) Question: When you can see a partial desktop is there a way to scroll around to observe or control the entire desktop?

Answer: No. They wanted to change this but there wasn't time to implement it. It requires a major design change. Hopefully in the next release things will be different.

So, number 4 in the Network Administrator Toolkit (ANAT) ReadMe says that if you view a workstation with a smaller monitor, you will see only part of the shared screen. Although the ReadMe doesn't say it, the opposite is true too. If you share, control or observe a workstation that has a larger screen (or bit depth greater than administrator screen) then you will see only part of the shared screen. This can be a problem in that you may not see the Hard Disk of the remote Macintosh. A possible workaround would be to type the name of the hard disk and use the Finders "open" command. This may allow you to see the contents of the window if the window is not off the viewable screen.

3) Question: Can I use other applications on my computer while I am controlling another computer?

Answer: No. The documentation states in Section 3 page 84, "You cannot use other applications on your workstation while using the control feature."

4) Question: What are the requirements for the administrators workstation monitor?

Answer: If you share, control or observe a workstation, the administrators workstation monitor should have an equal or higher resolution than the remote workstation.

5) Question: Are there any restrictions for the workstation monitor?

Answer: You cannot observe, control or share a screen that is displaying millions of colors. If the colors on the workstation monitor are set to millions you can use the "Change System Settings" feature to adjust the number of colors below millions.

HyperCard 2.3 Description (7/96)

Revised: 7/23/96
Security: Everyone

HyperCard 2.3 Description (7/96)

Article Created: 23 July 1996

TOPIC -----

This article contains a description of HyperCard 2.3.

DISCUSSION -----

Overview

HyperCard software is Apple's premier tool for creating custom software solutions for business, education, and multimedia. Commercial developers, consultants, in-house programmers, and end users can use HyperCard to acquire, manage, and display information any way they need to.

HyperCard organizes information into easy-to-use "stacks" of cards through which users can navigate and search for the information they need. Simply by clicking on a button, they can view related text, see a graphic, hear a sound, watch a QuickTime movie, or listen to text spoken out loud.

HyperCard is an ideal development tool for a wide range of applications, including multimedia presentations, front ends to host data, courseware, and computer-based training materials.

Beginners can start creating stacks right away; no scripting experience is required. The new Button Tasks feature lets you automatically integrate text, graphics, video, sound, spoken text, and links to other applications into your stacks without writing a single script. HyperCard also offers extensive on-line help, as well as ready-to-use stacks, templates, and elements.

At the same time, HyperCard provides a robust prototyping and development environment for professional developers. It comes with powerful scripting tools, a modeless script editor, hypertext support, debugging tools, external commands, and many other features to help you create powerful custom software. Use HyperTalk software—HyperCard's powerful, English-like scripting language—to add power and versatility to your stacks. HyperCard also comes with the AppleScript

scripting language. You can write AppleScript scripts that attach to HyperCard buttons to launch, control, and exchange data with other off-the-shelf scriptable applications, either locally or over a network.

HyperCard provides an easy mechanism for distributing your stacks. You can save any stack as a stand-alone, double-clickable Macintosh application that can be distributed without software royalty fees.

Features

Easy to use

- Organize information into convenient "stacks" of electronic cards
- Create applications quickly using ready-made buttons and text fields
- Integrate QuickTime movies, graphics, sounds, and spoken text into a HyperCard stack—no scripting experience required

Color and multimedia support

- Assign colors to HyperCard elements such as buttons, fields, and backgrounds
- Use 24-bit color painting tools to create color images and to import and resize color PICT graphics
- Have HyperCard text read aloud by your computer*
- Add QuickTime movies, sounds, and graphics to your stacks

Powerful development features

- Take full advantage of Power Macintosh systems with an accelerated version of HyperCard
- Use AppleScript from within HyperCard to launch, control, and exchange data with over 100 scriptable Macintosh applications
- Create and customize your own menus and tool palettes
- Extend HyperCard's functionality with commercially available add-on products, including third-party external command (XCMD) software

Support for global solutions

- Use WorldScript system extensions* to create multilingual HyperCard solutions
- Mix different character sets (including single-byte and double-byte characters) in a single field
- Script in French, Japanese, or other languages using international dialects of AppleScript software*

Stand-alone application capability

- Create double-clickable applications for customers, colleagues, or students who do not have HyperCard software
- Distribute HyperCard applications freely, without software royalty fees

* Requires additional software; see system requirements

HyperCard 2.3: Technical Specifications (7/96)

Revised: 7/23/96
Security: Everyone

HyperCard 2.3: Technical Specifications (7/96)

=====

Article Created: 23 July 1996

TOPIC -----

The following article contains a list of technical specifications and order information for HyperCard 2.3.

DISCUSSION -----

Technical Specifications
=====

Complete support for scripting languages

- Add power and versatility to HyperCard applications using HyperTalk—HyperCard's scripting language— or any scripting language compatible with the Open Scripting Architecture (OSA), such as AppleScript
- Attach AppleScript scripts to HyperCard objects such as buttons to launch and control other applications, exchange data with them, and so on— even over a network
- Link HyperCard stacks with any of more than 100 script-able applications, such as Claris FileMaker Pro 2.0 and Microsoft Excel 4.0 (applications must be running under System 7)
- Use localized versions of AppleScript system extensions to script in Japanese, French, or other languages (requires additional software)

Multimedia features

- Add QuickTime movies to stacks using the QuickTime Tools stack
- Include sound, animation, and graphics in your stacks
- Have HyperCard text read aloud by your computer

Color drawing and painting tools

-
- Choose from 256 colors to apply to buttons, fields, backgrounds, and cards
 - Import 24-bit color or grayscale PICT graphics
 - Resize, reposition, and edit graphics on the card
 - Create PICT images with 24-bit color painting tools

Automated Button Tasks

- Automatically assign tasks to buttons without writing a single script
- Go to another destination (first card, previous card, home, or others)
- Play a QuickTime movie
- Play a sound
- Have text read aloud (using PlainTalk software)
- Launch another application
- Apply visual effects for transitions between cards

Powerful development features

- Third-party external commands (XCMDs) let you control a wide variety of systems and equipment, including mainframe computers, networks, videodisc players, and CD-ROM drives.
- Hypertext applications can be created by linking a word or group of words.
- Modeless script editor lets you view several scripts and stacks at once and quickly copy and paste HyperTalk or AppleScript code between them.
- Debugging menu lets you set checkpoints in, and step and trace through, a HyperTalk script while it's running, for fast and easy troubleshooting.
- Background processing lets you continue working in other applications while complex scripts are running or while you compact or sort a stack.
- Variable Watcher shows how variables are used and changed and lets you edit variables while debugging your script.
- Message Watcher lets you view HyperTalk messages as they're sent, so you can see how your program's logic really works.
- "Save as" options let you create stand-alone applications or ones that can run using HyperCard Player (widely available on Macintosh systems).

Flexible formatting and reporting

- Design multiple report layouts for each stack—and copy and paste report formats between stacks
- Control the content, appearance (including font, size, and style), and placement of text elements in report formats
- Create card sizes ranging from 1 by 1 inch to 18 by 18 inches
- Print individual fields, selected parts of a card, a single card, selected

cards (containing a certain word, button, or background), or an entire stack

System requirements

- An Apple Macintosh, Power Macintosh, or PowerBook computer; QuickTime Tools requires a 68020 or later processor; text-to-speech function requires a 68040 or later processor
- A hard disk drive
- At least 2MB of RAM required for HyperCard 2.3; 4MB of RAM required for system software version 7.0 or later, QuickTime Tools, and AppleScript; at least 5MB of RAM is recommended when using Color Tools
- Macintosh system software version 6.0.5 or later; Version 7.0 or later required for Color Paint Tools; Version 7.1 or later required for AppleScript, HyperCard button tasks, and the stand-alone application builder
- QuickTime Tools requires the QuickTime system extension; text-to-speech function requires PlainTalk software (included) Button Tasks requires AppleScript system extension
- Multilingual HyperCard applications may require WorldScript software and/or international versions of AppleScript software

Ordering Information

HyperCard 2.3

Order No. M2365Z/B

- HyperCard version 2.3 software for 680x0-based Macintosh systems
- HyperCard version 2.3 software for Power Macintosh systems
- HyperCard reference manuals and example stacks
- AppleScript RunTime Edition software
- AppleScript Reference and sample stacks

Product specifications are subject to change. Check with your authorized Apple reseller for the most current information about product specifications and configurations.

Network Assistant: Workstation Access Denied (8/96)

Revised: 8/1/96
Security: Everyone

Network Assistant: Workstation Access Denied (8/96)

=====

Article Created: 23 July 1996
Article Reviewed/Updated: 1 August 1996

TOPIC -----

I configured a group of workstations to administer with Network Assistant. Today the status of one of the workstations shows "Access Denied". What can cause this?

DISCUSSION -----

You will get this status displayed if you change the workstation's Network Assistant password after you have added it to a workstation list. You must remove the workstation from any list it is on and add it to the list again to access it from Network Assistant.

Network Assistant: Using the Network Performance Report (8/96)

Revised: 8/1/96
Security: Everyone

Network Assistant: Using the Network Performance Report (8/96)

=====

Article Created: 23 July 1996
Article Reviewed/Updated: 1 August 1996

TOPIC -----

This article comes from the Apple Network Administrator Toolkit (ANAT) manual and describes how the information from the Network Performance Report can be used.

DISCUSSION -----

The Network Performance Report includes information that you can use to evaluate the performance of your network. Here are some suggestions for using the Network Performance Report:

- The number of routers between your workstation and another workstation can affect the time the packets take to return. When you evaluate the times for a workstation, you should compare them to the times for a workstation in the same area of the network or with the same number of intervening routers.
- If the number of routers is not what you expect, there may be a problem with your network.
- If the maximum time for a packet to return from a workstation is significantly greater than the times for other workstations in the same area of your network, there may be a problem with the workstation.
- If a single workstation has a large number of lost packets, there may be a problem with the network connection to that workstation.
- If several workstations in the same area of the network have a large number of lost packets, there may be a network connection problem or a problem with an intervening router or bridge.

Network Assistant: Interpreting Status Messages (8/96)

Revised: 8/1/96
Security: Everyone

Network Assistant: Interpreting Status Messages (8/96)

Article Created: 23 July 1996
Article Reviewed/Updated: 1 August 1996

TOPIC -----

This article describes what the Network Assistant, part of the Apple Network Administrator Toolkit (ANAT) workstation status messages mean and how to respond to them.

DISCUSSION -----

The Workstation Status window shows you the name and the status of each workstation in a list of workstations. Usually the status is the name of the application program running on each workstation, but other messages may appear in the Status column.

If a message appears in red, the last command you tried to execute on a particular workstation failed. These messages remain in the Status column for about 30 seconds, or until you perform another command on the workstation.

Access denied

The password for this workstation is no longer valid. If you know the new password for the workstation, choose Workstations from the Setup menu and use the Workstations dialog box to remove the workstation from the list then add it to the list again, entering the new password when requested.

Applications are open

You tried to replace the System Folder or delete all of the other items on a workstation's hard disk when an application was open on the workstation. You must first quit all of the open applications on the workstation. Ask the user to quit all of the applications, or choose Quit Applications from the Manage menu to quit the applications. You can also choose Control from the Interact menu, then quit any open applications.

Application not found

You tried to open an application or a document of an application that is not installed on the workstation. Use the Copy Items command to copy the application to the workstation. (Make sure that your licensing agreement allows you to copy the application.)

AVP: Channel XX

The workstation is displaying TV channel XX using the Apple Video Player.

Command failed

The last command failed to execute on the workstation. This may be because of the applications that are open on the workstation. Ask the user to quit all of the applications, or choose Quit Applications from the Manage menu to quit the applications. You can also choose Control from the Interact menu, then quit any open applications. After you quit the applications, try the command again. If the command still fails, try restarting the workstation.

Command not authorized

You do not have permission to perform the command you tried on the workstation. Before you can use the command, either you or the user must change your access privileges on the workstation using Network Assistant Security. You may have permission to perform other commands on the workstation.

Communication error

Network Assistant was unable to send the last command to the workstation because the workstation is not operating properly or there was a high level of network activity. Create a Network Performance Report for this workstation and several workstations near it to determine whether there are problems communicating with this particular workstation. If the report indicates that all the workstations are performing at the same level, try the command again. If the command continues to fail, try restarting the workstation. If this problem occurs often, there may be a problem with your network.

Copying Items

This message appears when items are being copied to a workstation using Network Assistant. If the message is dimmed, the Copy Items or Copy Hard Disk command is being executed from another administrator's workstation.

Deleting Items

This message appears when items are being deleted from a workstation using Network Assistant. If the message is dimmed, the Delete Disk or Delete Selected Items command is being executed from another administrator's workstation. The workstation will not be available for other commands until it has finished deleting the items.

Disk Full

You tried to copy items to the workstation, using the Copy Items or Copy Hard Disk command, and it doesn't have enough free disk space for the new items. To determine how much free disk space is available on the workstation, create a System Information Report. If you want to delete items from the workstation, you can create a Software Search Report and delete any unnecessary items. You can also choose Control from the Interact menu, then delete items from the workstation's hard disk.

File transfer error

An error prevented you from copying items to this workstation. Restart the workstation and try the command again. If this problem continues, use the Disk First Aid application (available on the Disk Tools disk or the system software CD-ROM that came with your computer) to check the workstation's hard disk.

Generating Report

This message appears when Network Assistant is creating a report that includes the workstation. If this message is dimmed, the report is being created from another administrator's workstation. The workstation will not be available for other commands until the report is complete.

Incompatible hardware

You tried to copy system software to a workstation that cannot support this software. You can copy the System Folder from a 680XX workstation only to other 680XX workstations. You can copy the System Folder from a Power Macintosh only to other Power Macintosh computers.

Incompatible printer

You tried to update printer settings on a workstation that has printing software different from that on your workstation. You can update the printer settings only on workstations that have the same printing software as your workstation. For example, if your workstation has QuickDraw GX installed, the other workstation must have QuickDraw GX installed.

Item exists

You tried to copy an item to a location on the workstation that has an item with the same name. After you cancel the copy command, this message indicates which workstations already have the item. Create a Software Search Report to find out more information about the item. You can then delete or replace it.

Item not found

You tried to open or delete an item that could not be found on the workstation. If you want to open the item on the workstation, choose Copy Items from the Manage menu to copy the item to the workstation.

Item in use

..TIL20194-Network_Assistant-Interpreting_Status_Messages_8-96.pdf

You tried to delete or replace an item on the workstation when the item is open or in use by an application. Ask the user to close the item or quit the application, or choose Quit Applications from the Manage menu to quit the application. You can also choose Control from the Interact menu, then close the item or quit the application. After you have closed the item or quit the application, try the command again. If the command continues to fail, try restarting the workstation.

Locked Screen

This message appears when a workstation's screen is locked using Network Assistant. Choose Lock Screen to unlock the screen. If the message is dimmed, the screen was locked from another administrator's workstation.

Modal dialog on screen

A dialog box appears on the workstation's screen and must be closed before the command can be performed on the workstation. Ask the user to close the dialog box. You can also choose Control from the Interact menu, then close the dialog box. Once the dialog box is closed, try the command again.

Monitor setting invalid

You tried to change the monitor settings for a workstation (using the Change System Settings command) to a number of colors that is not supported by that workstation.

Network Assistant open

Certain commands, such as Restart, Control, and Share Screen, cannot be executed on a workstation where Network Assistant is open. Ask the user to quit Network Assistant.

Not enough memory

There is not enough free random-access memory (RAM) on the workstation to execute the last command. Many of the commands you can perform on another workstation using Network Assistant require some memory on the other workstation. For example, sharing a screen can require several hundred kilobytes of free memory. To free memory on the workstation, ask the user to quit all open applications, or choose Quit Applications from the Manage menu to quit the applications. You may be able to choose Control from the Interact menu, then quit open applications. After you have quit the applications, try the command again.

Old Assistant software

This message appears when a workstation has a version of the Network Assistant workstation software that is older than the version of Network Assistant you are using. You must install the new version of the workstation software on the workstation before you can administer it.

Rebuilding Desktop

This message appears when the workstation's desktop database is being rebuilt using Network Assistant. If the message is dimmed, the Rebuild Desktop command was executed from another administrator's workstation. The workstation will not be available for other commands until rebuilding the desktop database is finished.

Screen: name

This message appears when the screen of workstation name is being displayed on this workstation's screen. Choose Share Screen to stop sharing the screen on the workstation. If the message is dimmed, the Share Screen command was executed from another administrator's workstation.

Screen sharing active

Certain Network Assistant commands cannot be executed on a workstation that is currently using screen sharing. Before you can use this command, you must choose Share Screen from the Interact menu to stop screen sharing on the workstation.

Slow network connection

Your network connection does not support screen sharing, controlling, or observing. To use these features of Network Assistant, the workstations must be connected to Ethernet or another network of similar performance.

Sound hardware in use

You tried to talk to a workstation where an application is recording a sound using the computer's sound input hardware. Ask the user to stop recording sound on the workstation, then choose Talk from the Interact menu again.

Talk not supported

You tried to talk to a workstation that does not have a built-in microphone or does not allow you to play a sound while it is recording a sound. You can still use the announce feature of Network Assistant with the workstation.

Unable to delete item

The command to delete an item failed for an unknown reason. You may be able to choose Control from the Interact menu, then delete the item. If this fails, use the Disk First Aid application (available on the Disk Tools disk or the system software CD-ROM that came with your computer) to check the workstation's hard disk for problems.

Unavailable

This message appears when Network Assistant is unable to communicate with a workstation; for example, if the workstation is turned off. The message also appears in these cases:

- if the Network Assistant software has been removed from the workstation
- if there is a problem with the workstation's network connection

- if the workstation has moved to a different zone on the network
- if the workstation's Macintosh name has been changed

To fix these problems, perform the following procedures:

- Open Network Assistant Security on the workstation to determine whether the Network Assistant software is installed correctly. If the software is not installed correctly, a message appears when you open the program telling you that there is a problem.
- Open the Chooser on the workstation to see if the workstation is connected to the network and to verify that the workstation is in the zone it was in when you added it to the workstation list. If the workstation is in a different zone, choose Workstations from the Setup menu and use the Workstations dialog box to remove the workstation from the list then add it to the list again.
- Open the Sharing Setup control panel on the workstation to verify that the Macintosh name has not changed since you added it to the workstation list. If the workstation's Macintosh name has changed, choose Workstations from the Setup menu and use the Workstations dialog box to remove the workstation from the list, then add it to the list again. If you cannot identify the problem or the workstation continues to be unavailable, try restarting the workstation.

Apple Network Administrator Toolkit: System Requirements (8/96)

Revised: 8/1/96
Security: Everyone

Apple Network Administrator Toolkit: System Requirements (8/96)

=====

Article Created: 23 July 1996
Article Reviewed/Updated: 1 August 1996

TOPIC -----

This article describes the system requirements for the Apple Network Administrator Toolkit (ANAT).

DISCUSSION -----

System requirements
=====

The Network Administrator Toolkit requires the following hardware, system software, and peripheral devices.

Servers

- The At Ease for Workgroups server software requires a Mac OS based computer with AppleShare file server software (version 3.0 or later) installed on it.

IMPORTANT: At Ease for Workgroups 4.0 requires an AppleShare file server; you cannot use personal file sharing instead.

- The Network Assistant software can be installed on any Mac OS based computer used as a server, including At Ease for Workgroups servers, AppleShare file servers, or FirstClass servers.

IMPORTANT: You cannot use Network Assistant on a Macintosh Plus computer.

- The User and Group Manager server software requires an AppleShare file server (version 3.0 or later) or FirstClass server (version 2.5 or later).

NOTE: To use User and Group Manager with a FirstClass server, you must set up the server as described in Appendix B, "Setting Up a FirstClass Server", in Part 4 of the manual.

To use the Network Administrator Toolkit software components on a server computer, the computer may need additional random-access memory (RAM).

Network

- An AppleTalk network is required. Ethernet or another network of similar performance is recommended.

Most features of the Network Administrator Toolkit will work with LocalTalk, but the Share Screen, Observe, and Control features of Apple Network Assistant require Ethernet or another network of similar performance.

Administrator workstations

- A Mac OS based computer with a minimum of 8 MB of RAM

If you plan to use more than one Network Administrator Toolkit application at a time, the computer may need additional RAM.

IMPORTANT: You cannot use Network Assistant on a Macintosh Plus computer.

- Macintosh system software version 7.1 or later

To use the drag-and-drop feature of Network Assistant to copy files from the Finder to other workstations, you need system software version 7.1.2 or later.

- A monitor with a minimum resolution of 640 by 480
- Desktop printer software (optional)

NOTE: You need this software to use the At Ease printer page quota feature.

Depending on the version of the system software installed on the workstation, the Network Administrator Toolkit software may require additional system software. The Installer will install this software automatically if necessary.

User workstations

- A Mac OS based computer with a minimum of 4 MB of RAM

IMPORTANT: You cannot use Network Assistant on a Macintosh Plus computer.

- Macintosh system software version 7.1 or later
- Desktop printer software (optional)

NOTE: You need this software to use the At Ease printer page quota feature.

- If using At Ease or other file services, the AppleShare workstation software, which is normally installed with your system software.

Depending on the version of the system software installed on the user workstation, the Network Administrator Toolkit software may require additional system software. The Installer will install this software automatically if necessary.

Network Assistant: Workstation Status Unavailable (8/96)

Revised: 8/1/96
Security: Everyone

Network Assistant: Workstation Status Unavailable (8/96)

=====

Article Created: 23 July 1996
Article Reviewed/Updated: 1 August 1996

TOPIC -----

I have a computer lab administered by the Apple Network Assistant Toolkit (ANAT). At times, Network Assistant will report a workstation's status as "unavailable." When I check the workstation, the screen saver is activated. Is there any relationship? Under what conditions can a workstation become unavailable?

DISCUSSION -----

Every 30 seconds, the Macintosh running the Network Assistant application will poll the network to verify the availability of workstations configured under Network Assistant. Any workstations that fail to answer this "are you there" request will be marked unavailable. As the request is continually delivered, correcting for the workstation's inability to respond will automatically make it available again after a subsequent status request is answered.

Typically, failure to answer these status requests can be attributed to common network connectivity issues: a break in the cabling or connections, a frozen or powered-down CPU, a bad network card or transceiver, and so forth.

As in the case of your screen saver, it is possible (though uncommon) that an application may delay, prohibit, or otherwise interfere with other background processes, such as the process that allows the workstation to respond to this status request. Some applications preempt these background processes in order to allow the application to perform optimally for the user, though in such cases they will USUALLY provide user-definable options to "allow background processes" or "monitor system activity," and the like. Check with the manufacturer of your software to confirm this possibility. Finally, it could certainly also be the case that your screen saver allows background processes, but is simply in outright conflict with the system or network software.

Network Assistant: Monty Python's Pythonizer Screen Saver (8/96)

Revised: 8/1/96
Security: Everyone

Network Assistant: Monty Python's Pythonizer Screen Saver (8/96)

=====

Article Created: 23 July 1996
Article Reviewed/Updated: 1 August 1996

TOPIC -----

The Network Assistant, part of the Apple Network Administrator Toolkit (ANAT), seems to have a problem with Monty Python's Pythonizer Screen Saver. If a workstation is setup to be administered by Network Assistant, the workstation's status will show as 'Unavailable' when the screen saver is activated.

DISCUSSION -----

Every 30 seconds, the Macintosh running the Network Assistant application will poll the network to verify the availability of workstations configured under Network Assistant. Any workstations that fail to answer this "are you there" request will be marked unavailable. As the request is continually delivered, correcting for the workstation's inability to respond will automatically make it available again after a subsequent status request is answered.

It is possible (though uncommon) that an application may delay, prohibit, or otherwise interfere with other background processes, such as the process that allows the workstation to respond to this status request. Some applications preempt these background processes in order to allow the application to perform optimally for the user, though in such cases they will USUALLY provide user-definable options to "allow background processes" or "monitor system activity," and the like. Check with the manufacturer of your software to confirm this possibility. Finally, it could certainly also be the case that the software allows background processes, but is simply conflicts with the Network Assistant.

Multiprocessing Software: Read Me (8/96)

Article Created: 23 July 1996
Article Reviewed/Updated: 2 August 1996

TOPIC -----

This article contains the ReadMe file for the Multiprocessing Software included with the Power Macintosh 9500/180 MP.

DISCUSSION -----

Important Information About the Multiprocessing Software

Contents

- Introduction
- Installing Multiprocessing Software
- Turn off virtual memory and do not install RAM Doubler
- Turn off hard disk sleep
- Important Information About Document Auto-Save

Introduction

This document provides information about the multiprocessing software that is included with your multiprocessor Power Macintosh computer, and how to configure your computer properly to take advantage of multiprocessor performance.

Installing Multiprocessing Software

Your multiprocessor Power Macintosh computer comes with Apple Multiprocessing software already installed, but doing a "clean" installation of system software will remove the multiprocessing software, and may also turn on virtual memory. (See the "Troubleshooting" chapter of your Power Macintosh User's Manual for more information about clean installation of system software.)

After doing a clean installation of system software, be sure to reinstall the multiprocessing software on this disk. Also, follow the instructions in the next section to turn off virtual memory if necessary. Otherwise, your multiprocessor-compatible software applications will not be able to take advantage of the second PowerPC processor.

To reinstall the multiprocessing software, double-click the Installer icon on the disk, and follow the instructions on the screen.

Turn off virtual memory and do not install RAM Doubler

Turn off virtual memory in the Memory control panel, and do not install Connectix RAM Doubler software. If virtual memory is turned on or RAM Doubler is installed, then your multiprocessor-compatible software applications will not be able to take advantage of the second PowerPC processor.

To turn off virtual memory, open the Memory control panel and in the Virtual Memory section, click the Off button. Then restart your computer. For more detailed information about virtual memory, see the "Memory" topic area in Macintosh Guide, available in the Guide menu.

Turn off hard disk sleep

Make sure that the hard disk sleep interval is set to "Never" in the Energy Saver control panel. Otherwise, software applications designed to work with your multiprocessor Power Macintosh may not work properly.

To set your hard disk sleep interval, do the following:

1. Open the Energy Saver control panel.
2. If necessary, click Show Details to make the additional options available.
3. Drag the top and bottom sliders as shown below.

If you wish, you can set a display sleep interval by dragging the middle slider. Display sleep works properly with multiprocessor-compatible software applications.

Important Information About Document Auto-Save

The Energy Saver control panel contains a feature named "Document Auto-Save." The purpose of this feature is to automatically quit all open applications during an idle or scheduled shutdown, while saving changes to any open documents in each application. Since there are literally thousands of applications available for the Macintosh (with new ones always arriving), we cannot guarantee that Document Auto-Save will be compatible with every application. This is especially true for any application that does not use standard routines to implement the alerts or dialog boxes used to save changes to new or modified documents. When Document Auto-Save is incompatible with an application, it will either not automatically quit, or it will display alerts or dialog boxes that Document Auto-Save does not recognize and therefore does not dismiss.

If you intend to turn Document Auto-Save on, we recommend that you monitor its operation during the first attempted idle or scheduled shutdown and note if any of your applications are not compatible. You can avoid problems with incompatible applications simply by making sure you leave open no documents that are new or modified before an idle or scheduled shutdown is to occur. Alternatively, you can modify the Document Auto-Save preferences in the Energy Saver control panel so the computer will sleep rather than shut down when unsaved documents are open.

For instructions for using Energy Saver & Document Auto-Save, choose Macintosh Guide from the Guide menu when the Finder is active, and choose the Energy Saving topic area.

HyperCard 2.3.5 Update: Read Me (7/96)

Revised: 7/24/96
Security: Everyone

HyperCard 2.3.5 Update: Read Me (7/96)

=====

Article Created: 24 July 1996

TOPIC -----

This article contains the ReadMe file for the HyperCard 2.3.5 Update Installer.

DISCUSSION -----

Overview

=====

This program updates your copy of HyperCard 2.3 and the StackToApp stack translator to version 2.3.5 and installs updated versions of four HyperCard stacks. From time to time, Apple produces maintenance releases of software to add minor functionality, fix defects or respond to customer requests. Our goal with this updater is to make it as convenient as possible for you to obtain the enhanced functionality in HyperCard 2.3.5.

This document tells you how to install the HyperCard 2.3.5 update to HyperCard 2.3, and describes what benefits it offers. Please read this entire "Read Me" file. It contains important information and tips that will enhance your experience with HyperCard 2.3.5. We recommend that you print a copy for reference.

This updater will NOT work on versions 2.2 or earlier of HyperCard. It will also not work with the HyperCard Player application. If you need to upgrade your copy of HyperCard call (800) 950-2442 for the Apple Reseller nearest you. To order HyperCard directly from APDA, if you are in the United States, call (800) 282-2732.

It is recommend that you update to system software version 7.5.3 or later in order take advantage of improvements to the latest versions of PlainTalk, the Sound Manager, and Macintosh Easy Open.

It is recommended that you make a backup copy of your HyperCard folder before installing this update.

..TIL20202-HyperCard_2-3-5_Update-Read_Me_7-96_(TA35821).pdf

You'll need enough room for both the original application and the new version (approximately 2.6 MB of disk space for both).

To install the HyperCard 2.3.5 update follow these steps:

Easy Install

=====

- * Double-click on the "Install HC 2.3.5 Update" application to open it.

- * Make sure that "Easy Install" is selected in the pop-up menu in the upper left-hand corner of the window.

- * Select the folder where HyperCard 2.3 resides using a button labeled "Select Folder" or by choosing "Select Folder" in a pop-up menu that appears toward the bottom of the window (this will be the case if you have more than one disk mounted). When the folder containing HyperCard 2.3 is highlighted in the standard file dialog, click the "Select" button to select it.

- * Click the "Install" button to install the new software and perform the update of your HyperCard application.

- * During the installation, you will be asked if you wish to replace copies of the Power Tools and Readymade Buttons stacks if they are present. If you have made changes to these stacks that you'd like to preserve, click the "Skip" button to skip replacing each of these. If you wish to replace the stack, click the "Replace" button. If you wish to replace both of these stacks, click the "Replace All" button in the dialog that appears. You can install any of these stacks later using the Custom Install feature of the Installer (see below).

- * After the installation has completed you will be asked if you wish to quit the installer or continue. If you wish to install the update into any other folders containing HyperCard 2.3, click "Continue."

- * After the installation completes, you will now have version 2.3.5 of the StackToApp translator, 2.3.5 versions of the Audio Help, Color Tools, Power Tools, and Readymade Buttons stacks, a Read Me document, HyperCard updated to version 2.3.5, your old version of HyperCard renamed HyperCard.old, and an application for updating other copies of the HyperCard 2.3 application to version 2.3.5. Please see the instructions below for using this updater application.

Note: If the copy of HyperCard in the folder you selected is not version 2.3, you will get an error message at the end of the installation indicating that an invalid file was selected for updating.

Custom Install

=====

- * Double-click on the "Install HC 2.3.5 Update" application to open it if necessary.

- * Make sure that "Custom Install" is selected in the pop-up menu that appears in the upper left-hand corner of the window.

..TIL20202-HyperCard_2-3-5_Update-Read_Me_7-96_(TA35821).pdf

* Select the folder where HyperCard resides using a button labeled "Select Folder" or by choosing "Select Folder" in a pop-up menu (this is the case if you have more than one disk mounted). When the folder containing HyperCard appears in the standard file dialog, click the "Select" button to select it.

* Select the software you wish to install by clicking the checkbox next to its name. You can click the triangle next to the HyperCard Stacks items to see more choices.

* Click the "Install" button to install the new software into the folder you selected.

How to use the HyperCard 2.3.5 Updater Application

=====

* Double-click on the "HyperCard 2.3.5 Updater" application to open it.

* You will be shown a Read Me document which you may print or save. After you've read the Read Me document. Click the "Continue" button.

* The updater will search for copies of HyperCard 2.3 on any mounted disk to update.

* Select a copy of HyperCard.

* Click the "Update" button.

* You may continue updating as many copies of HyperCard 2.3 that are present, as you wish.

Note: Any copies of the 2.3 version of the HyperCard Player that are present will be shown. The HyperCard Player cannot be updated to version 2.3.5. If you'd like to obtain a copy of the 2.3.5 version of the HyperCard Player from an Apple FTP site you may use the following Internet address:

ftp://ftp.info.apple.com/Apple_Support_Area/Apple.Software.Updates/
US/Macintosh/Utilities/HyperCard_Player_2.3.5.sea.hqx

HyperCard 2.3.5 Update Release Notes

=====

Changes in HyperCard

- HyperCard's performance on machines with large numbers of fonts installed has been vastly improved, particularly on Macintosh computers with PowerPC microprocessors.

- A problem that caused the text of fields to be printed at the resolution of the screen instead of the resolution of the printer has been fixed.

- Problems that caused selections within list fields to be displayed incorrectly have been fixed.

..TIL20202-HyperCard_2-3-5_Update-Read_Me_7-96_(TA35821).pdf

- The "Link To" button in the Button Info dialog once again appears on all systems.

Changes in StackToApp

- A problem that caused standalones to be created with a corrupted version of the AddColor external has been fixed.

Changes in the Color Tools Stack

- A problem was fixed that prevented stacks colorized with Color Tools 2.3 on a Macintosh computer with a PowerPC microprocessor from being used on a different Macintosh computer with a PowerPC microprocessor.
- The Color Tools now work more reliably on Macintosh systems that have the Japanese Language Kit or the Chinese Language Kit installed.
- The "Redraw Screen" command now works properly with stacks that have been colorized with other versions of the Color Tools.
- The "Compact Color Database" command now works properly with colorized cards and backgrounds whose IDs are greater than 32767.

Changes in the Audio Help Stack

The following changes were made to the Audio Palette to make it work properly on newer Macintosh models, including the Power Macintosh 7200, 7500, 8500, and 9500.

- The Audio Palette now records at the following qualities: Good (22 kHz, 6-to-1 compression), Better (22 kHz, 3-to-1 compression), and Best (22 kHz, no compression). This is a change from older versions of the Audio Palette, which recorded at Good and Best qualities and had a different idea of Good quality (11 kHz, no compression).
- There is now a one-to-one correspondence between compression and quality settings. "No compression" is synonymous with "Best quality," "3-to-1 compression" with "Better quality," and "6-to-1 compression" with "Good quality."
- You can still open and edit sounds recorded with the old Audio Palette at its "Good" quality. When you do this, the new Audio Palette displays the quality as "Other".
- From a script, you can still set the "speed" property of the Audio Palette to "11k". This will allow you to use the old "Good" quality. When you do this, the new Audio Palette displays the quality as "Other".
- The Audio Palette has a new property, "quality". From a script, you can set this property to "Good", "Better", or "Best".
- The documentation in the Audio Help stack has been updated to reflect the changes in the Audio Palette.

Changes in the Power Tools Stack

- The Super Grouper tool now works more reliably with a wider range of stacks.
- Starting with HyperCard 2.3, the option that allows the Picture XCMD to display a picture from the clipboard requires that the word "clipboard" be quoted, as follows:

Picture "From The Clipboard", "clipboard"

The documentation in the Power Tools stack has been updated to reflect this change.

Changes in the Readymade Buttons Stack

- The "Show Clipboard Picture" button on the card that demonstrates how to hide and show pictures now works properly.

Speech Recognition Extension 1.5: Read Me (1/97)

Revised: 1/20/97
Security: Everyone

Speech Recognition Extension 1.5: Read Me (1/97)

=====

Article Created: 24 July 1996
Article Reviewed/Updated: 20 January 1997

TOPIC -----

This article contains the ReadMe file for version 1.5 of the Speech Recognition extension.

DISCUSSION -----

Version 1.5 of the Speech Recognition extension fixes a few bugs that prevented version 1.4.1 of Apple's English Speech Recognition software from running on some PowerPC-based Performas and PowerBooks*. (see "Bugs fixed..." below.) To install the latest configuration of Apple's speech recognition software on your computer, follow these steps:

1. Install version 1.4.1 of "English Speech Recognition."

This installer installs version 1.4.1 of the Speech Recognition extension as well as the utility 'Speakable Items' which allows you to open any file in the Speakable Items folder (which is installed in your Apple Menu Items folder) just by speaking its name.

2. Replace version 1.4.1 of the Speech Recognition extension with version 1.5 of the extension.

Replace version 1.4.1 of the Speech Recognition extension with version 1.5. First turn Speakable Items off and close the Speech control panel if it is open. Then simply drag version 1.5 of the Speech Recognition extension onto your system folder. Reply "OK" to the alert that asks you if you're sure you want to replace the existing Speech Recognition extension file with the newer one. (If the system will not let you replace the existing Speech Recognition extension with the new one, try restarting the computer with extensions off -- by holding the Shift key down during startup -- and then replace the extension.) Finally, restart your computer. That's it!

We will soon release (at <http://speech.apple.com/>) version 1.5 of the "English Speech Recognition" installer, which will install the new extension along with the rest of the English Speech Recognition software in one step, rather than these two steps.

If you do not have 'English Text-To-Speech (TTS)' installed (5225K), you may wish to install it first. English TTS allows your Macintosh to synthesize speech. You can verify that English TTS is already installed by finding and opening the Speech control panel, then selecting 'Voice' from the Options pop-up menu. If you are able to choose a voice, the TTS software is already installed. If English TTS is not installed, we recommend you install it first since it is used by the English Speech Recognition software.

Bugs fixed by Speech Recognition version 1.5

=====

- Now works on PowerPC based PowerBooks* when used with the built-in microphone.
- Now works on all Performa 52xx, 53xx, 62xx and 63xx models without muting sound output.
- ...and many other minor fixes designed to let other developers create applications that use Apple's speech recognition technology.

* The following computers are in the PowerPC-based PowerBook computer family: PowerBook 5300, 5300c, 5300ce, 5300cs, 2300c, 1400c, and 1400cs. Additionally PowerBook 200 and 500 series computers which have PowerPC upgrade cards installed are included in the PowerPC-based PowerBook computer family.

Article Change History:

20 Jan 1997 - Added details about PPC-based PowerBook computers.

Arabic Language Kit: Character Encoding Type (7/96)

Revised: 7/25/96
Security: Everyone

Arabic Language Kit: Character Encoding Type (7/96)

=====

Article Created: 25 July 1996

TOPIC -----

I am using the Arabic Language Kit (ALK), and I am trying to import Arabic text from a non-Macintosh computer. What type of character encoding does ALK use?

DISCUSSION -----

The character encoding table used in the Arabic Language Kit is shown on page A-21 of the Installation and User's Manual for the ALK. This encoding method is essentially ISO 8859-6 plus a set of punctuation for Arabic and Arabic digits. OSMO 449 is based on ISO 8859-6.

Performa 5200 & 6200: Upgrade for 14.4 Internal Modem ? (9/96)

Revised: 9/24/96
Security: Everyone

Performa 5200 & 6200: Upgrade for 14.4 Internal Modem ? (9/96)

Article Created: 25 July 1996
Article Reviewed/Updated: 24 September 1996

TOPIC -----

Is it possible to upgrade the Global Village Gold IIv 14.4 Kbps internal modem, which is included with certain Macintosh Performa 5200 and 6200 series computers, to 28.8 Kbps?

DISCUSSION -----

Apple does not offer an upgrade for your modem. However, Global Village has recently released an upgrade path for your modem. This upgraded internal modem would replace the modem already installed in your computer.

Contact Global Village Communications directly (800-469-3764) to order this modem or to obtain additional information, including compatibility with specific computer systems and pricing.

Note that support for this modem, once installed on a Performa computer, will be provided by Global Village directly. Apple only supports Global Village modems which are bundled with specific systems.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

OpenDoc: Latest Version & Release History (7/96)

Revised: 7/25/96
Security: Everyone

OpenDoc: Latest Version & Release History (7/96)

Article Created: 25 July 1996

TOPIC -----

What is the latest version and release history of OpenDoc?

DISCUSSION -----

The latest release of OpenDoc is 1.0.4, also known as Developer Release 5 (DR5). This is the fifth release of OpenDoc and new releases have been coming about every four months. The first three releases were primarily intended for developers, and of little interest to the general public. Developer Release 4 corresponded to the first version 1.0 public release.

Here is a summary of dates of the DR releases

OpenDoc with SOM (DR1) - December, 1994

OpenDoc with SOM (DR2) - April, 1995

OpenDoc (DR3) - August, 1995

OpenDoc 1.0 (DR4) - December, 1995

Highlights: CFM-68K and CyberDog A3c1, bug fixes & performance optimizations, consolidation of CFM extension library files from 13 down to 3.

OpenDoc 1.0.4 (DR5) - April, 1996

Highlights: OpenDoc source code, ODF Release 1, third party components, Apple "Kickstart Components"

At the World Wide Developers Conference in May, 1996, CyberDog version 1.0 became available which requires OpenDoc 1.0.4.

Power Macintosh 9500/180MP & 9500/200: Description (8/96)

Revised: 8/5/96
Security: Everyone

Power Macintosh 9500/180MP & 9500/200: Description (8/96)

Article Created: 25 July 1996
Article Reviewed/Updated: 5 August 1996

TOPIC -----

This article contains a description of the Power Macintosh 9500/180MP and 9500/200 computers.

DISCUSSION -----

Apple Power Macintosh 9500/180MP and 9500/200 computers are the top of the line in speed, performance, expandability, and upgradability, which is tremendous news for publishers, engineers, and multimedia professionals.

The Power Macintosh 9500/180MP computer represents a new arena for Apple; a multiprocessor system with two 180-megahertz PowerPC 604e chips, which provides simple, but powerful performance improvements for applications that take advantage of its multiprocessing capabilities. And the Power Macintosh 9500/200 is simply our fastest Apple Macintosh computer, featuring a 200-megahertz PowerPC 604e processor. With six expansion slots that support the industry-standard, high-performance Peripheral Component Interconnect (PCI) architecture, these two systems are also the most customizable, expandable Macintosh computers in history. PCI technology offers low-cost cards for such uses as videoconferencing, video production, and high-speed networking.

Power Macintosh 9500/180MP and 9500/200 systems feature an 8x-speed CD-ROM drive for easy, fast access to CD-ROM-based materials. They run all applications written for 680x0-based Macintosh computers, as well as applications for the Mac OS that have been accelerated to take advantage of PowerPC processor technology. In addition, a number of noted developers of graphics, video, and scientific/technical applications for the Mac OS are revamping their products specifically to take advantage of the multiprocessing capabilities of the Power Macintosh 9500/180MP. These capabilities can provide significant performance improvements in processor-intensive applications such as video-editing and 3D modeling. And if you want to run MS-DOS and Windows applications, you can install a PC Compatibility Card from Apple in one of the

system's many PCI slots--and switch instantly between the computing environments.

On the communications front, these computers support both 10BASE-T and AAUI Ethernet connection. And they include all of the software you need for easy Internet access.

So whether you're involved in publishing, engineering, or multimedia--or simply want the most powerful, expandable Macintosh computer ever--one of the Power Macintosh 9500 systems is sure to meet your needs.

Features

=====

High performance

- * One 200-MHz PowerPC 604e processor or two 180-MHz PowerPC 604e processors
- * Built-in floating-point processor and 64K cache
- * 512K level 2 cache

Communications and multimedia

- * Two high-speed serial ports compatible with GeoPort and LocalTalk cables
- * 8x-speed CD-ROM drive
- * 16-bit stereo audio input and output
- * Support for speech-recognition and text-to-speech capabilities

Expandability

- * Six industry-standard PCI expansion slots
- * Dual-channel SCSI connector for hard disks, CD-ROM drives, and other SCSI devices
- * Two internal expansion bays for additional hard disk drives

Compatibility

- * Includes 10BASE-T and AAUI Ethernet connectors
- * Supports Open Transport networking software (TCP/IP and AppleTalk)
- * Runs 680x0 Macintosh applications as well as applications accelerated for Power Macintosh computers
- * Reads Mac OS, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats
- * Runs MS-DOS and Windows applications via optional PC Compatibility Cards
- * Comes with all of the software required for Internet access

System 7.5 software

- * Makes working with different applications consistent, so they're easier to learn and use
- * Allows easy customization of your Macintosh to reflect the way you work
- * Provides active assistance in learning new features with Apple Guide
- * Includes MacLinkPlus file translation software from DataViz

Ordering Information

=====

Power Macintosh 9500/180MP

Order No. M5399LL/A

Power Macintosh 9500/180MP computer with 32 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 2 GB hard disk drive, an internal 8x-speed CD-ROM drive, and a PlainTalk microphone. Includes mouse; system software version 7.5.3 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Power Macintosh 9500/200

Order No. M5397LL/A

Power Macintosh 9500/200 computer with 32MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 2 GB hard disk drive, an internal 8x-speed CD-ROM drive, and a PlainTalk microphone. Includes mouse; system software version 7.5.3 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Power Macintosh 9500/200

Order No. M5389LL/A

Power Macintosh 9500/200 computer same as above (order no. M5397LL/A) except with 16 MB of RAM.

Optional Enhancements

* PC Compatibility Card with Pentium 100-MHz processor

Order No. M4092LL/A

* PC Compatibility Card with 586 100-MHz processor

Order No. M4091LL/A

* Apple QuickDraw 3D Accelerator Card

Order No. M4333LL/A

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

Power Macintosh 9500/180MP and 9500/200: Specifications (9/96)

Revised: 9/11/96
Security: Everyone

Power Macintosh 9500/180MP and 9500/200: Specifications (9/96)

Article Created: 25 July 1996
Article Reviewed/Updated: 11 August 1996

TOPIC -----

This article contains the technical specifications for the Power Macintosh 9500/180MP and 9500/200.

DISCUSSION -----

Upgradable microprocessor

- * One 200-MHz PowerPC 604e processor or two 180-MHz PowerPC 604e processors
- * Integrated floating-point unit and 64K cache
- * High-speed system bus (up to 50 MHz)
- * Upgradability (up to 250 MHz)

Memory

- * 16 MB or 32 MB of RAM, expandable to 768 MB via 12 DIMM sockets
- * 4 MB of ROM
- * 512K level 2 cache

Disk drives

- * Internal 2GB Fast SCSI hard disk
- * Internal Apple SuperDrive floppy disk drive
 - Accepts high-density 1.4 MB disks and 800K disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- * Internal 8x-speed CD-ROM drive
- * Two expansion bays for additional 3.5-inch hard disks

Interfaces

- * Six PCI expansion slots compatible with PCI 2.0-compliant cards

- * Two high-speed DMA serial (RS-232/RS-422) ports compatible with LocalTalk and GeoPort cables
- * 10BASE-T and AAUI-15 Ethernet connectors; optional PC Compatibility Cards provide multinode support for simultaneous network connections
- * Internal Fast SCSI bus (up to 10MB/s)
- * External SCSI bus (up to 5MB/s)
- * Apple Desktop Bus (ADB) expansion port
- * Mini jacks for stereo audio input and output
- * 16-bit stereo sound input and output ports
- * DB-15 connector for monitor (on accelerated graphics card)

Graphics support

=====

(configured through accelerated graphics card)

- * 2 MB of VRAM, expandable to 4 MB
- * Support for display resolutions of up to 1,280 by 1,024 pixels
- * 24-bit color up to 1,152- by 870-pixel resolution
- * Refresh rate of up to 75 Hz

GeoPort telephony

=====

- * 14.4-Kbit/s modem support
- * V.17 fax support
- * GeoPort Fax and GeoPort Telephony software included
- * Speakerphone and answering-machine capability

Clock/calendar

=====

- * Custom integrated circuit with long-life battery

Keyboard and mouse

=====

- * Supports ADB keyboards with numeric keypads
- * Comes with an ADB Mouse II

Electrical requirements

=====

- * Line voltage: 100 to 125 and 200 to 240 V AC, RMS single phase, automatically configured
- * Frequency: 50 to 60 Hz, single phase
- * Power: 225 W maximum, not including display

ADB power requirements

=====

- * Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is recommended)
- * Mouse draws 10 mA
- * Keyboard draws 25 to 80 mA (varies with keyboard used)

Size and weight

=====

- * Height: 16.9 in. (43.0 cm)
- * Width: 7.7 in. (19.6 cm)

- * Depth: 15.75 in. (40.0 cm)
- * Weight: 28 lb. (12.7 kg)

Environmental requirements

=====

- * Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- * Storage temperature: -40 to 116 degrees F (-40 to 47 degrees C)
- * Relative humidity: 5% to 95% noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

AppleCD 1200i CD-ROM Drive: Specifications (9/96)

Revised: 11/14/96
Security: Everyone

AppleCD 1200i CD-ROM Drive: Specifications (9/96)

=====
Article Created: 25 July 1996
Article Reviewed/Updated: 20 September 1996

TOPIC -----

This article contains the specifications for the AppleCD 1200i, an internal 8x-speed CD-ROM drive included with some Macintosh computers.

DISCUSSION -----

Disc diameter
=====
120 millimeters (5.25 inches) and 80 mm

Scanning velocity
=====
1.2-1.4 meters per second (normal speed)

Rotation speed (varies over radius)
=====
Normal speed

approximately 530 to 230 rpm

Double speed

approximately 1060 to 460 rpm

Eight-times speed

approximately 4240 to 1840 rpm

Latency (average) (varies over radius)
=====

Normal speed

approximately 55 to 130 milliseconds (ms)

Double speed

approximately 27.5 to 65 ms

Eight-times speed

approximately 6.88 to 16.25 ms

Blocks per rotation

=====

approximately 8.4 to 19.5 variable

Average access time (typical)

=====

Normal speed

380 ms

Double speed

270 ms

Eight-times speed

160 ms

Data

====

Data capacity

* 656 MB, Mode 1

* 748 MB, Mode 2

Number of blocks per disc

336,150

Data per block

* 2048 bytes, Mode 1

* 2336 bytes, Mode 2

Address description

Minutes, seconds, blocks

Audio capacity

=====

Playing time

74 minutes, 42 seconds

Modes supported

=====

Audio CD

CD-ROM

Modes 1 and 2

CD-ROM XA

Mode 2, Forms 1 and 2

CD-I

Mode 2, Forms 1 and 2

Photo CD

Single session and multisession

Video CD

Data streaming and transfer rates

=====

Blocks per second

* Normal speed 75

* Double speed 150

* Eight-times speed 600

User kilobytes (K) per second

* Normal speed

- 150K, Mode 1

- 171.1K, Mode 2

* Double speed

- 300K, Mode 1

- 342.2K, Mode 2

* Eight-times speed

- 1200K, Mode 1

- 1368.8K, Mode 2

SCSI bus burst rate (typical)

* Asynchronous: 5.0 MB per second

* Synchronous: 5.0 MB per second

Power consumption (typical)

=====

* +5 V DC: 350 milliamperes (mA)

* +12 V DC: 300 mA

Laser

=====

Type

Semiconductor GaAlAs laser

Wavelength

770 to 795 nanometers

Output power

0.2 to 0.6 milliwatts

Beam divergence

55 deg.

Macintosh Performa 6400: Voltage Settings (8/96)

Revised: 8/5/96
Security: Everyone

Macintosh Performa 6400: Voltage Settings (8/96)

Article Created: 25 July 1996
Article Reviewed/Updated: 5 August 1996

TOPIC -----

What is the purpose of the small switch located on the back of the Macintosh Performa 6400 computer to the left of the power plugs?

DISCUSSION -----

That switch is the voltage switch, which is used to set the voltage level appropriate for the country where you are using the Macintosh Performa 6400 computer. This voltage switch MUST be set correctly to avoid damaging the computer.

The voltage switch can be set to 115 or 230 voltages. Use 115 for voltages between 100 and 130. Set the switch to show 230 for voltages between 200 and 270. Insert a screw driver in the slot to set the switch to the appropriate setting.

IMPORTANT:

Below is a listing of the voltage requirements for some countries. Some countries use two standardized voltages (for example, either 100 or 220). If you are not sure which voltage you have, check with the electricity supply company before plugging in the Performa 6400.

Begin_Table

Country	Single Voltage
-----	-----
Japan	100
Algeria, Indonesia, Lebanon, Libya, Peru, S. Korea, Vietnam	100 or 220
Ecuador, Jamaica, Philipines, Taiwan	110

Bermuda, Canada, Puerto Rico, United States, Venezuela	120
Colombia, Mexico, Saudi Arabia	127
Brazil	127 or 220
Hong Kong	200
India, South Africa	220-250
Israel, Pakistan, Singapore	230
Australia, Kuwait, Malta, New Zealand, Northern Ireland, Papua New Guinea, Oman, Qatar, United Kingdom	240
Austria, Belgium, Denmark, Finland, France, Germany, Greece, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland	220-230
Bahrain, Chile, China (People's Republic), Czechoslovakia, Egypt, Greenland, Hungary, Iceland, Iran, Jordan, Liechtenstein, Nepal, Paraguay, Poland, Romania, United Arab Emirates, Russia and the Commonwealth of Independent States, Yemen, Yugoslavia	220

End_Table

Macintosh Performa 6400: Sound FAQ (12/96)

Revised: 1/21/97
Security: Everyone

Macintosh Performa 6400: Sound FAQ (12/96)

Article Created: 25 July 1996
Article Reviewed/Updated: 12 December 1996

TOPIC -----

This article contains frequently asked questions (FAQ) about the sound capabilities of the Macintosh Performa 6400/180 and 6400/200 computers.

Questions Answered in this FAQ:

- =====
- 1) Does the Macintosh Performa 6400 series have 8-bit or 16-bit sound?
 - 2) What is the purpose of the subwoofer on the Macintosh Performa 6400 series?
 - 3) What happens when I turn the subwoofer balance control, which is located on the back of the computer?
 - 4) Why are there two sound output jacks--one in front and one in back?
 - 5) What is SRS Sound?
 - 6) I have headphones plugged into my monitor, but I still hear sound coming out of your computer. Why?
 - 7) I am using the headphones plugged into the front of the computer, but the sound appears distorted. What could be causing this?
 - 8) Why do I not hear any sound emitting from the computer?
 - 9) What is the speaker size and frequency range of the subwoofer?
 - 10) What effect does the subwoofer have on the SRS technology?

DISCUSSION -----

- 1) Question: Does the Macintosh Performa 6400 have 8-bit or 16-bit sound?

Answer: The Macintosh Performa 6400 series has 16-bit stereo sound input and output.

2) Question: What is the purpose of the subwoofer on the Macintosh Performa 6400?

Answer: The subwoofer, which is built into your computer, functions as a full-range, monophonic speaker. However, when you attach external speakers to the sound output port on your computer (or if your monitor has built-in speakers) the subwoofer functions only as a bass speaker, to augment and complement the stereo sound coming from the speakers.

3) What happens when I turn the subwoofer balance control, which is located on the back of the computer?

Answer: If you want to increase or decrease the bass coming from the subwoofer in relation to the sound coming from the external speakers, adjust the subwoofer balance control. The subwoofer balance control only works when external speakers are attached.

4) Question: Why are there two sound output jacks--one in front and one in back?

Answer: The Macintosh Performa 6400 has two sound output jacks, one on the front and one on the back. Both output jacks are connected to the sound amplifier. Inserting a plug into either jack disconnects the internal speakers. The jack on the front is intended for headphones, and the jack on the back is intended for external speakers. The rear jack is muted when headphones are plugged in the front jack.

5) Question: What is SRS Sound?

Answer: SRS (Sound Retrieval System) is proprietary technology from SRS Labs, which Apple has licensed and implemented on the Power Macintosh 5400/120 computer in order to enhance the sound field of the computer.

The useability, compatibility, and performance of the computer is not affected if SRS sound is enabled or disabled. However, enabling SRS yields a more spacious stereo sound from the computer. You can try it both ways to determine which you prefer.

For additional information about SRS, use the search string "SRS" to locate the Tech Info Library article, "Macintosh Computers: What is SRS Sound?"

6) Question: I have headphones plugged into my monitor, but I still hear sound coming out of the computer. Why?

Answer: When you plug headphones into the headphone jack on your monitor, you hear the sound through the headphones but the subwoofer sound also continues to come out of the subwoofer in your computer. To avoid this, plug your headphones into the headphone jack on the front of the computer, not the monitor.

If you want to keep the headphones connected to the monitor, manually turn down the subwoofer. Turn the knob in the subwoofer balance control port all the way to the left to turn off the subwoofer volume. Remember to turn it back up the next time you want to hear the subwoofer.

7) Question: I am using the headphones plugged into the front of the computer, but the sound appears distorted. What could be causing this?

Answer: You may have SRS turned on, which does not work through headphones. To turn it off, open the Monitors & Sound control panel, which can be found in the Apple menu, and click the Sound icon. Then click to remove the check mark next to SRS.

8) Question: Why do I not hear any sound emitting from the computer?

Answer: Turn up the subwoofer balance control on the back of your computer. It may have been turned down too far.

The subwoofer balance control affects the subwoofer volume only in relation to external speakers, if you've attached external speakers or if your monitor has built-in speakers. Otherwise, it has no affect on your computer's overall volume. Adjust your computer's overall volume by using the sound controls on the front of the computer or monitor, by using the volume control sliders in the Monitors & Sound control panel, or by using the volume controls in AppleCD Audio Player (if you're listening to a CD).

9) Question: What is the speaker size and frequency range of the subwoofer?

Answer:

The speaker on the subwoofer is called a "74mm square-frame device", which means it is a 3-inch round speaker. The frequency range is approximately 70 Hz to 10 kHz.

10) Question: What effect does the subwoofer have on the SRS technology?

Answer: The subwoofer has no effect on the SRS technology since SRS does not need a subwoofer to perform. Essentially, the subwoofer makes the resulting sound much fuller. For additional information about SRS, use the search string "SRS" to locate the Tech Info Library article, "Macintosh Computers: What is SRS Sound?"

Article Change History:

12 Dec 1996 - Added additional information about the subwoofer.
02 Aug 1996 - Changed distribution status.

PowerBook 5300: Focus Enhancements Video Card Sound Issue (9/96)

Revised: 9/5/96
Security: Everyone

PowerBook 5300: Focus Enhancements Video Card Sound Issue (9/96)

Article Created: 25 July 1996
Article Reviewed/Updated: 5 September 1996

TOPIC -----

I have a Focus Enhancements MV16 video card installed in my PowerBook 5300 computer, and I have an external monitor connected to the Focus card. Whenever, a sound plays, the system locks up. This started happening after I installed additional memory in my computer. What could be causing this?

DISCUSSION -----

This issue only occurs with the MV16-EN and MV16 Focus Enhancement cards when more than 32 MB of system memory is installed in the PowerBook 5300 series computers and an external monitor is connected. Focus Enhancements has been able to reproduce this issue consistently when memory cards that increase the total memory in the system to over 32 MB are installed along with the Focus MV-16 or MV16-EN card.

Apple Computer, Inc. is in the process of resolving this issue by changing a resistor value on the logic board of the PowerBook. If you are experiencing this issue, contact Apple or an Apple Authorized Service Provider to have your logic board replaced.

In the interim, you can use these workarounds:

- * Reduce the sound level to minimum in the Sound control panel.
- * Temporarily remove the RAM expansion card, reducing the actual RAM to 32 MB or lower when needing to play a sound with an external monitor attached.

MacX 1.5: Open Transport and MacTCP Tool (7/96)

Revised: 7/26/96
Security: Everyone

MacX 1.5: Open Transport and MacTCP Tool (7/96)

=====

Article Created: 26 July 1996

TOPIC -----

I am installing MacX 1.5 on a Power Macintosh running Open Transport. When I launch MacX and try to remotely connect to an X system, I get this message, "The remote command 'x' attempted to use connection tool 'MacTCP Tool', which does not exist."

The MacX Read Me file says MacTCP Tool is not needed when using Open Transport. What do I do?

DISCUSSION -----

The MacX Read Me file is not correct. When using Open Transport, MacX does require the MacTCP Tool. You need to perform a MacX custom installation and select the MacTCP Tool.

Power Macintosh 5400: Flashing Mark at Startup (7/96)

Revised: 7/29/96
Security: Everyone

Power Macintosh 5400: Flashing Mark at Startup (7/96)

=====

Article Created: 24 July 1996

TOPIC -----

Sometimes when I attempt to start up my Power Macintosh 5400/120 computer, a flashing question mark appears on the screen. What could be causing this?

DISCUSSION -----

It is likely that you are holding down the button on the mouse while starting up the computer. Holding down the mouse button at startup causes the computer to attempt to eject a floppy disk. However, if you do not have a floppy disk installed, the flashing question mark appears. If you release the mouse button, the startup process will continue normally.

LaserWriter Bridge: How To Find (7/96)

Revised: 7/29/96
Security: Everyone

LaserWriter Bridge: How To Find (7/96)

Article Created: 29 July 1996

TOPIC -----

I have a Macintosh Centris 660AV and a Power Macintosh 8500 sharing a LaserWriter Select 360f with Phone Net. We got an AAUI transceiver for the Centris, some 10Base-T and got the two machines to share files, but we cannot see the LaserWriter in the chooser anymore.

I understand there is an Apple product available (which does not run on PCI Power Macintosh computers) called the LaserWriter Bridge, that will let a LaserWriter be shared on the network even though the two computers are connected via Ethernet. I've been snooping all over, however, I have only able to find AppleShare 4.2.1 updater which contains a LaserWriter Bridge patcher.

Am I missing something, should I be using PrinterShare or something?

DISCUSSION -----

You should use the LaserWriter Bridge which is available as part of the NSI 1.5.1 disk that can be found using the following path on our ftp sites:

US/Macintosh/Network&Communications/Network SW Installer/

You should use this software on the Centris 660AV since, as you correctly pointed out, the LaserWriter Bridge is not compatible with Open Transport.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Powerbook 190 & 5300: Why Is Ethernet Not An Option? (7/96)

Revised: 7/29/96
Security: Everyone

Powerbook 190 & 5300: Why Is Ethernet Not An Option? (7/96)

=====

Article Created: 29 July 1996

TOPIC -----

I have a Macintosh Powerbook 5300 series computer. When I open either the Network or AppleTalk control panel, I only have the choice for LocalTalk Built In. I checked the Extensions folder and all Ethernet components appear to be installed. What am I doing wrong? Why is LocalTalk my only choice? Doesn't this computer work with Ethernet?

DISCUSSION -----

When a Macintosh PowerBook 190 or 5300 series computer starts up, it checks for the presence of Ethernet hardware driver software. If it does not find hardware driver software which supports Ethernet (in this case, usually an Ethernet PC Card), the only choice available in the network setting control panels is LocalTalk. Of course, if the PC Card is not in the PC Card slot, Alternate Ethernet is a pop-up menu option, but you cannot connect to Ethernet network without first inserting the card.

When the Ethernet card's driver software is installed you can select Ethernet in either the Network or AppleTalk control panel, depending on whether you are using classic networking or Open Transport, respectively.

Japanese Language Kit 1.2:WorldScript Update & Sys 7.5.2 (7/96)

Revised: 7/29/96
Security: Everyone

Japanese Language Kit 1.2:WorldScript Update & Sys 7.5.2 (7/96)

=====

Article Created: 29 July 1996

TOPIC -----

I am using Japanese Language Kit 1.2 on a Power Macintosh 7500. I noticed that the WorldScript Update is in the Apple Extras folder on the system software CD-ROM disc. Do I need to install this update?

DISCUSSION -----

No, you should not install the WorldScript Update (version 1.0) contained in the Apple Extras folder. That update installs older versions of WorldScript software than are installed by the Japanese Language Kit 1.2.

The WorldScript Update v1.0 installs version 7.5.1 of WorldScript I, WorldScript II, and InputBackSupport. The Japanese Language Kit 1.2 installs version 7.5.1 of WorldScript II and version 7.5.2 of InputBackSupport.

If you have installed WorldScript Update 1.0 after installing the Japanese Language Kit 1.2, you should reinstall the Japanese Language Kit 1.2.

Note: System 7.5 Update 2.0, which updates the system to System 7.5.3, includes version 7.5.3 of InputBackSupport. If you install System 7.5 Update 2.0, you should not install WorldScript Update v1.0 on the Power Macintosh 7500 or 9500 computers because it will overwrite the newer InputBackSupport.

PC Compatibility Card: PC CD-ROM Discs Aren't Recognized (12/96)

Revised: 12/9/96
Security: Everyone

PC Compatibility Card: PC CD-ROM Discs Aren't Recognized (12/96)

Article Created: 29 July 1996
Article Reviewed/Updated: 9 December 1996

TOPIC -----

I installed a PC Compatibility card into a Power Macintosh 5400/120 computer. However, when I attempt to use a CD-ROM disc in the PC environment, the CD-ROM drive is not recognized. How can I resolve this?

DISCUSSION -----

If you are running Macintosh System Software 7.5.3 or newer you must have Apple CD-ROM software version 5.1.7 (or newer) and PC Compatibility software version 1.5 installed before following the procedure described in this article.

It is likely that you do not have the driver for the Apple CD-ROM drive installed in the PC environment. This driver is not installed during the default installation of the PC Compatibility Card software.

To verify that the driver is not installed, first switch to the PC environment. At the DOS prompt, type EDIT CONFIG.SYS. The CONFIG.SYS editor appears on the screen showing the loading order for items on the DOS side. If the CD-ROM driver is installed, the last line of the CONFIG.SYS should read "DEVICEHIGH=C:\APPLE\CDROM.SYS/D:CDDRVR".

If this line does not appear, you need to install the CD-ROM driver, and you should also install QuickTime if you plan on using multimedia CD-ROM discs. Instructions for installing this software are included on page 74 of the PC Compatibility Card User's Manual (For 7-inch card).

Additionally, for the CD-ROM software to function, the AUTOEXEC.BAT file must have the line: LOADHIGH C:\DOS\MSCDEX.EXE /S /D:CDDRVR /L:E

MSCDEX.EXE is documented in the MS-DOS online help feature and not either of the user's manuals.

Type "Help MSCDEX" at the DOS prompt for more information.

This article was published in the Information Alley on 9 December 1996.

Article Change History:

09 Dec 1996 - Added info about version of CD software needed.

07 Nov 1996 - Added info about autoexec.bat file.

MacTCP: That pesky MacTCP is acting up again Message (7/96)

Revised: 7/29/96
Security: Everyone

MacTCP: "That pesky MacTCP is acting up again" Message (7/96)

=====

Article Created: 29 July 1996

TOPIC -----

I am trying to launch Netscape or any TCP/IP application on my computer and I get this message, "That pesky MacTCP is acting up again." What does this mean?

DISCUSSION -----

What does "That pesky MacTCP is acting up again." Message Mean?

=====

- The PPP/SLIP software is not successfully connecting to your Internet Service Provider (ISP).

The PPP extension and ConfigPPP control panel have to be installed, or the appropriate SLIP software. You need to verify that a modem connection is made to your ISP before launching a TCP/IP application. You should launch ConfigPPP or ConfigSLIP and dial out through that software.

- Confirmation messages from the connection software will show when a successful connection is made,
- Or error messages will indicate what is wrong.

- The MacTCP or TCP/IP control panel is not configured correctly.

See the "Correct MacTCP or TCP/IP Configuration Setup" section below for more information

- The MacIP server is down or does not have an available IP address.

You should select a different zone that also has a MacIP server on the network. This is selected under the EtherTalk or LocalTalk icon's pop-up menu in the MacTCP control panel.

- The Internet Gateway or Router is down or the address is entered

incorrectly (this usually applies in manual IP configurations).

You have to ask your network administrator for a list of valid Internet Gateway or Router IP addresses.

- The MacTCP or TCP/IP files are corrupt.

If you are using MacTCP, throw the MacTCP control panel, MacTCP DNR, and MacTCP Prep files into the trash.

- Reinstall MacTCP with a custom installation from the Mac OS 7.5 installer, or drag-copy from previous system versions. You will have to enter all necessary information in the control panel.

If you are using Open Transport and TCP/IP, throw the TCP/IP control panel and TCP/IP Preference files into the trash.

- Reinstall the TCP/IP control panel with a custom installation from the Mac OS 7.5.2 or higher installer. Once at the Custom Install choices, extend Networking, extend Open Transport, and choose TCP/IP. You will have to enter all necessary information in the control panel.

Correct MacTCP or TCP/IP Configuration Setup

=====

MacPPP or FreePPP connection

Classic AppleTalk

- 1) Open the MacTCP control panel
- 2) Highlight the PPP icon and click More
- 3) In the More section, Obtain Address: Server
- 4) In the More section, Select the correct IP Address Class: the ISP will provide this info.
- 5) In the More section, Fill in the Domain Name Server Information: the ISP will provide this info.

Open Transport in Basic User Mode

- 1) Open the TCP/IP control panel
- 2) Choose Connect via: MacPPP
- 3) Choose Configure via: Using PPP Server
- 4) Fill in the Name Server address and domain names: the ISP will provide this info.

NOTE: When connected to the ISP, the PPP server will fill in the blanks in this TCP/IP control panel

MacSLIP or other SLIP software connection

The procedures are the same as for MacPPP or FreePPP.

MacIP Server connection

Classic AppleTalk

- 1) Open the MacTCP control panel

- 2) Select EtherTalk (on an Ethernet network) or LocalTalk (on a LocalTalk network or ARA (Apple Remote Access) connection) icon.
- 3) From the pop up menu below the correct icon, select the zone that has a MacIP server, the network administrator will provide this information.

Open Transport in Basic User Mode

- 1) Open the TCP/IP control panel
- 2) Select Connect via: AppleTalk (MacIP)
- 3) Select Configure via:
 - a) Using MacIP Server, when using server assigned address
 - Select MacIP Server Zone: the network administrator will provide this information.
 - Enter Search domains: the network administrator will provide this information.
 - b) Using MacIP Manually - when using manually assigned address that the server manages Select MacIP Server Zone: the Net Admin will provide this info. The Net Admin will provide and the customer will enter: IP Address, Router address, Name server addr., and Search domains.

Manual IP Address connection

Classic AppleTalk

- 1) Open the MacTCP control panel
- 2) Select the Ethernet icon.
- 3) In the More section, Obtain Address: Manually.
- 4) In the More section, The Net Admin will provide and the customer will enter: Gateway Address, IP Address Class (A, B, or C), Subnet Mask, and Domain Name Server(s)
- 5) Okay out of this window.
- 6) In the MacTCP window, type in the assigned IP address in its box.

Open Transport in Basic User Mode

- 1) Open the TCP/IP control panel
- 2) Select Connect via: Ethernet
- 3) Select Configure via: Manually
- 4) The Net Admin will provide and the customer will enter: IP Address, Subnet Mask, Router Address, Name Server addr:, and Search Domains.

For more information on connecting with Open Transport 1.1 and PPP or SLIP software, refer to the Technical Information Library article, "Open Transport 1.1 Read Me" for version numbers, and where to obtain the software.

LocalTalk/LaserWriter Bridge 2.1f2 Beta Read Me (7/96)

Revised: 7/29/96
Security: Everyone

LocalTalk/LaserWriter Bridge 2.1f2 Beta Read Me (7/96)

Article Created: 29 July 1996

TOPIC -----

This article is the LocalTalk/LaserWriter Bridge 2.1f2 Beta Read Me file.

DISCUSSION -----

Thank you for your interest in the LocalTalk/LaserWriter Bridge. As a final step before general release of the LocalTalk/LaserBridge 2.1, Apple is making version ZM-2.1f2 available to customers. We are working hard at providing a bridge solution for our CPU products that require Open Transport.

Warnings and Information About Beta Software

LocalTalk Bridge and LaserWriter Bridge 2.1f2 is "beta software" -- that is, it is not the finished version of LocalTalk Bridge/ LaserWriter Bridge 2.1.

This software is being provided for test purposes and does not come with Apple technical support. Do not call Apple technical support or the Apple Assistance Center with questions, comments, or problem reports about LocalTalk Bridge or LaserWriter Bridge 2.1f2.

LocalTalk Bridge and LaserWriter Bridge 2.1f2 is provided on as-is basis. It is not warranted to be complete or free from bugs or errors. LocalTalk Bridge 2.1f2 or LaserWriter Bridge 2.1f2 may cause problems with your Mac OS computer and with other software you have installed. These problems may require you to reinstall the Mac OS System Software from your original floppy disks or CD-ROM disc.

If you want to provide Apple with feedback about LocalTalk Bridge/LaserWriter Bridge 2.1f2, send electronic mail to: bridge-seed@support.apple.com. Apple does not guarantee any response to messages you send to this address, and does not provide technical support for LocalTalk Bridge/LaserWriter Bridge 2.1f2 through this or any other medium or channel.

System Requirements

System 7.1 or later

Classical AppleTalk or Open Transport

System 7.5.3 requires a minimum of 4MB (680x0) or 8MB (PowerPC) total memory.

Open Transport requires a minimum of 5MB (680x0) or 8MB (PowerPC). Open Transport memory requirements are based on total system memory including Virtual Memory, minus the size of any RAM disk and disk cache you choose.

Installation

If you are using the LocalTalk Bridge software, run the LocalTalk Bridge ZM-2.1f2 patch application. This will patch the installed LocalTalk Bridge control panel to be compatible with Open Transport.

If you are using the LaserWriter Bridge software, simply replace your installed version with the enclosed 2.1f2 version. The 2.1f2 version is compatible with Open Transport.

ARA 2.1 Personal Server For Macintosh: Read Me (7/96)

Revised: 7/30/96
Security: Everyone

ARA 2.1 Personal Server For Macintosh: Read Me (7/96)

=====

Article Created: 30 July 1996

TOPIC -----

This article is the Apple Remote Access (ARA) 2.1 Personal Server For Macintosh ReadMe file.

DISCUSSION -----

APPLE REMOTE ACCESS PERSONAL SERVER FOR MACINTOSH READ ME

=====

This document provides late-breaking news about the Apple Remote Access Personal Server that is not covered in the "Apple Remote Access Personal Server User's Guide." You may need to refer to that guide to understand the use of several terms in this document, and you may want to print this document to keep with your user's guide.

Modems Supported by the Apple Remote Access Personal Server

=====

Scripts that support most popular modems are provided on the Remote Access Personal Server installation disks. The scripts include:

3Com Impact Analog 14.4
3Com Impact ISDN 56K
3Com Impact ISDN 64K
Apple Modem 2400
AT&T Dataport 288
AT&T KeepInTouch
Dayna CommuniCard 28800
Farallon Netopia 56K
Farallon Netopia 64K
GeoPort/Express Modem
GeoPort/Express Modem CNG
Global Village Gold/Silver/Mercury

Global Village Platinum
Hayes Accura 288
Hayes Optima 14.4
Hayes Optima 288
Megahertz CruiseCard 14.4
Megahertz CruiseCard 28.8
Metricom Ricochet Wireless
Microcom MicroPorte 4232bis
Microcom QX/4232bis
Motorola 326xV34
Motorola BitSURFR 56K
Motorola BitSURFR 64K
Motorola Power/Lifestyle 28.8
Practical Peripherals V.34
Prometheus ProModem 144e
Prometheus ProModem 96
PSI PowerModem II
PSI PowerModem III/IV
Supra 144
Supra 288
TDK DF2814
Telebit QBlazer
Telebit T3000
Telebit Worldblazer
US Robotics Universal
Zoom V-series

Beginning with version 2.1 of the Apple Remote Access Personal Server and the companion Client product, modem scripts are no longer stored in the Extensions Folder. A new folder called "Modem Scripts" within the Extensions Folder is created by Apple Remote Access to hold modem scripts.

The Apple Remote Access Installer will move any existing scripts you may already have in your Extensions Folder to the new Modem Scripts folder in addition to placing scripts for all the modems listed above into the Modem Scripts folder.

Future remote access products from Apple will also use the Modem Scripts folder. However, there will be a transition period before other products are updated to use the new folder. Some existing products may install modem scripts into the Extensions Folder. If such a product is installed after Apple Remote Access 2.1, you will have to open your Extensions Folder and drag the scripts into the Modem Scripts folder in order for Apple Remote Access to recognize the script.

You can use modem scripts included with the Apple Remote Access MultiPort Server (any version) with version 2.1 of Apple Remote Access Personal Server. You can also use AppleTalk Remote Access version 1.0 modem scripts with version 2.1 of the Personal Server, but certain new features, such as Ignore Dial Tone, Manual Dialing, and MNP 10 support, won't be available. Additionally, you will be able to use scripts from future Apple dial-up products with version 2.1 of Apple Remote Access. But, see the note below on some issues related to manual dialing.

Apple Remote Access and System 7.5.3

=====

The Read Me documents for System 7.5.3 and System Update 2.0 suggest that Apple Remote Access should be installed before System 7.5.3. This is not necessary. Beginning with version 2.1, Apple Remote Access should be installed after System 7.5.3.

Installing ARA X.25 Client over Apple Remote Access 2.1

=====

The Apple Remote Access X.25 Client installer places X.25 scripts into the Extensions folder. If you install the X.25 additions after installing Apple Remote Access 2.1, you will have to open your Extensions Folder and drag the X.25 scripts into the Modem Scripts folder in order for Apple Remote Access to recognize the scripts.

If you use the Apple Remote Access 2.1 installer to upgrade your existing Remote Access 2.0.1 and X.25 Client, the installer will move the scripts for you.

Compatibility with AppleTalk Remote Access 1.0

=====

Version 2.1 of the Apple Remote Access Personal Server will successfully connect to both AppleTalk Remote Access 1.0 compatible servers and Apple Remote Access 2.x compatible servers. The compatibility setting in the connection document of earlier version 2.0 and 2.0.1 has been removed. Since connection to either style server is automatic, the setting is no longer necessary.

The next major upgrade to Apple Remote Access will no longer support ARA 1.0 clients or servers.

Using an MNP 10 Modem

=====

MNP 10 is an error-correction protocol that allows for more reliable data connections over cellular modems. Clicking the "Use MNP 10 error correction in modem" checkbox in the Remote Access Setup window puts MNP 10 modems into cellular mode. Do not click the "Use MNP 10 error correction in modem" checkbox to use MNP 10 over land lines.

To establish an MNP 10 connection, both your modem and the modem you're calling must support MNP 10; clicking the "Use MNP 10 error correction in modem" checkbox in the Remote Access Setup window is not by itself sufficient to establish an MNP 10 connection.

Manual Dialing

=====

The method used to do manual dialing in Apple Remote Access 2.0/2.0.1 has not worked well. Apple Remote Access presents a dialog asking you to dial, wait for the phone to ring, and then press OK. Often the user has to experiment to determine exactly when to press OK to dismiss the dialog.

To improve manual dialing, a new dialog has been incorporated into the modem scripts installed along with version 2.1 of Apple Remote Access. Two dialogs are now displayed when doing manual dialing. This first dialog is still present to provide backwards compatibility with the wide variety of existing modem scripts. When using newer scripts, the first dialog box should be dismissed before dialing, and you will be prompted by the modem script when to actually dial the phone. If you are using a modem script not included with this product, you may have to experiment to determine if the first dialog box should be ignored.

Future remote access and dial-up products from Apple will require the new style scripts and will not present two dialog boxes.

Using the Redialing Feature

=====

If the redialing option is selected, the Remote Access Personal Server attempts redialing only when the phone number that has been dialed is busy. If the connection attempt fails for any other reason including a failed call back attempt, Remote Access stops redialing so that you can correct any problems.

If you use the Redialing option, set the "Time between retries" number to five seconds or greater. Anything less than five seconds may not give your modem sufficient time to reset.

When using the Redialing Alternate Number option, the main number is dialed once and then redialing sequence alternates between the alternate and main numbers.

Using DialAssist

=====

If you are calling within a country with no city or area codes, and you encounter problems using DialAssist, try entering a space in the "Connect To City/Area Code" box in your connection document.

Serial Port Arbitration

=====

When a Remote Access connection is established, Remote Access prevents other application programs from using the serial port selected in the Remote Access Setup control panel. Most programs will inform you that the port is in use.

Apple Remote Access Personal Server provides this port arbitration through a system extension called the Serial Port Arbitrator located in the Extensions folder. Some programs that use the serial port may not be compatible with this extension. If you suspect that a program is not compatible with the Serial Port Arbitrator:

- 1) Remove the Serial Port Arbitrator file from the Extensions folder.
- 2) Restart your Macintosh.
- 3) Try the program again.

NOTE: The Serial Port Arbitrator will not work on a Macintosh if Remote Access Personal Server has not been installed.

High Speed Serial Connections

=====

Both Apple Remote Access Personal Server 2.1 and Client 2.1 support specifying a serial connection speed of 115200 bps in a modem script. Not all Macintosh built-in serial ports support connection speed of 115200 bps. Here is a list of Macintosh computers that do:

Centris/Quadra 660AV, Quadra 840AV
Macintosh Performa 61xx
Power Macintosh 61xx, 71xx, 72xx, 75xx, 76xx, 81xx, 85xx, 95xx
Workgroup Server 6150, 7250, 8150, 8550, 9150

In order to use the serial port at 115200 bps on one of these computers, you need a new serial extension called SerialDMA. System 7.5.3 or later incorporates this driver into the operating system.

If you use a modem script that specifies 115200 bps, and your computer does not support this data rate, Apple Remote Access will automatically fall back to 57600 bps.

Using a Local Printer

=====

If you are using a non-networked printer connected to the printer port of your Macintosh, you may get an error dialog when trying to initiate a connection or when trying to print while connected saying that one of your serial ports is already in use. You may need to select Remote Only in the Network Control Panel (AppleTalk Control panel for Open Transport-based machines).

Apple Remote Access Personal Server and the Apple Internet Router

=====

Apple Remote Access Personal Server should not be installed on the same Macintosh as the Apple Internet Router.

Using ARA Security Modules (like SecurID) with Virtual Memory

=====

There is an incompatibility between some ARA security modules (like SecurID) and Virtual Memory. This bug has been fixed in the latest system release (7.5.3).

Changes in version 2.1 of the Apple Remote Access Personal Server

=====

Modem scripts have been moved to a new Modem Scripts folder within the Extensions Folder.

The compatibility option in the connection document is no longer necessary and has been removed.

The method of manual dialing has been changed. See the section above.

Interoperability with some non-Apple Remote Access Servers has been improved.

The installer has been upgraded from version 3.4 to version 4.0.3.

There is no longer a separate Remote Access Aliases extension.

The installer is now on a single high-density diskette.

A bug that caused machines with certain extensions to crash during boot has been fixed in the Serial Port Arbitrator.

Serial port rates of up to 115,200 bps are now supported in modem scripts. If the computer doesn't support 115,200, Apple Remote Access will use 57,600 bps instead.

Apple Remote Access Client Updater: ReadMe (7/96)

Revised: 7/30/96
Security: Everyone

Apple Remote Access Client Updater: ReadMe (7/96)

=====

Article Created: 30 July 1996

TOPIC -----

This article is the Apple Remote Access (ARA) Client Updater Read Me file.

DISCUSSION -----

Name: Apple Remote Access Client Updater
Version: 2.1
Released: July 8, 1996
Description: The updater on this disk allows you to update ARA Personal Server 2.0, 2.0.1, 2.0.1 RevB or 2.0.1 RevC to ARA Personal Server 2.1.

From the Read Me included with this software:

Apple Remote Access Personal Server 2.1 Updater Read Me

The updater on this folder allows you to update ARA Personal Server 2.0, 2.0.1, 2.0.1 RevB or 2.0.1 RevC to ARA Personal Server 2.1. Before you run the updater, make sure that you have one of the previous version of ARA Personal Server installed in your Macintosh. If you have ARA Client installed, please download and run the updater for Apple Remote Access Client.

ARA Personal Server 2.1 supports serial port rates of up to 115,200 bps, provides better compatibility with ARA 1.0, and comes with modem scripts for most popular modems and ISDN terminal adapters. For more information, please refer to the 'Read Me' in 'Remote Access Files' folder.

To run the updater, simply launch the Installer application and follow the instructions.

NOTE: Previous version of ARA Personal Server installs the application program 'Remote Access Personal' in 'Remote Access Personal Folder' at the root of your hard disk. The updater will install ARA Personal Server 2.1's 'Remote Access

Personal' at the same location. If you moved the old 'Remote Access Personal' to other location in your hard disk, please delete it and remember to use the new application after the update.

Network Assistant and Copying Hard Disk (8/96)

Revised: 8/1/96
Security: Everyone

Network Assistant and Copying Hard Disk (8/96)

Article Created: 30 July 1996
Article Reviewed/Updated: 1 August 1996

TOPIC -----

I have a two identical computers, and I am trying to copy the hard disk from one computer to another using the Apple Network Assistant, part of the Apple Network Administrator Toolkit (ANAT). I'm choosing All other items in the Copy Hard Disk dialog box. The target computer has a 400 MB hard disk; the information I am trying to copy is 390 MB.

When I try to copy, I get a message that there is not enough space on the target drive to copy. What is wrong?

DISCUSSION -----

Make sure your target computer does not have virtual memory turned on. Virtual memory allocates space, for its use, on the hard disk in the amount set in the Memory control panel. Turn off virtual memory and restart, this should let you copy to the target computer.

QuickTime 2.5: Read Me (7/96)

Revised: 12/20/96
Security: Everyone

QuickTime 2.5: Read Me (7/96)

Article Created: 30 July 1996

TOPIC -----

This article is the QuickTime 2.5 ReadMe file.

DISCUSSION -----

Welcome to QuickTime 2.5

What is QuickTime?

The QuickTime system software extension enables you to create, edit, and play video, graphics, sound, sprites, text, music, 3D and animation in documents, CD-ROM titles, and over the internet. While you do not use QuickTime directly, it is the enabling technology behind your Macintosh multimedia experience.

Installing QuickTime 2.5

Before installing make sure you have Macintosh System Software version 6.0.7 or higher installed on your computer.

The QuickTime installer will place QuickTime extensions into your system folder. It will also install the MoviePlayer application into a new "QuickTime folder" on your hard disk drive. The MoviePlayer application can be used to play QuickTime content such as movies, animations, sounds, and music.

- 1) Double-click the installer icon to open it.
- 2) Read the first screen and click CONTINUE.
- 3) Read the Software License and click AGREE.
- 4) At the next screen, do one of the following:
 - To allow the installer to automatically install the correct components ensure the Easy Install is displayed in the pop-up menu.
 - To select specific items to install, open the pop-up menu and choose Custom Install.
 - To remove specific files that have been installed, select Custom

Remove.

5) Click the INSTALL button.

6) When you see the message that the installation was successful, click the RESTART button.

What's new in QuickTime v 2.5

- For music and karaoke fans

QuickTime 2.5 plays MIDI files back with CD quality sound on Power Macintosh systems (44.1 KHz, 16 bit, stereo).

QuickTime 2.5 allows you to play back karaoke files commonly found on the Internet. Try importing an Internet karaoke file using MoviePlayer.

In addition to playing music through the computer's built-in speaker, QuickTime 2.5 for Macintosh can route MIDI to external devices, using Apple's MIDI Manager, Opcode's Open Music System, or Mark Of The Unicorn's FreeMIDI system. Use the QuickTime Control Panel to route musical information.

- Graphic Importers

QuickTime 2.5 for Macintosh includes a new graphic importer component allowing for import of a variety of diverse file formats. With this feature, any application that is QuickTime aware is able to import file formats such as GIF, MacPaint, Silicon Graphics, and Photoshop directly into their application. Try importing graphics into SimpleText or any of your favorite applications.

- AutoPlay CD-ROM and audio CD's

QuickTime 2.5 for Macintosh allows you to automatically start playing a CD-ROM or audio CD when inserted or on when your Macintosh is powered up. Use the QuickTime Control Panel to turn this feature on or off.

Things You Should Know

If you experience sound problems with Sound Manager 3.2.x or above on a Quadra with a PowerPC card and System Software 7.5.1, you need to update your System Software to 7.5.3.

Power Macintosh 6400/6500: Connecting Multiple Monitors (4/97)

=====

Article Created: 31 July 1996
Article Reviewed/Updated: 30 April 1997

TOPIC -----

Since a Power Macintosh 6400 series computer (or Power Macintosh 6500) has a video port and two PCI slots, if I install two PCI video cards, can I attach three monitors to my computer?

DISCUSSION -----

No, although there are enough slots in these computers--through the monitor port and two PCI slots--to connect three monitors, due to the way the built-in video's brightness driver loads, it is possible for this driver to conflict with one of the PCI video card drivers. With only one PCI video card installed, this issue does not occur.

When two PCI video cards are installed, the computer can freeze or lose video on one of the monitors. This configuration is not recommended by Apple for Power Macintosh 6400 or Power Macintosh 6500 computers.

This article was published in the Information Alley on 6 January 1997.

Article Change History:

Macintosh Performa 6400: Modem Documentation? (12/96)

Revised: 12/10/96
Security: Everyone

Macintosh Performa 6400: Modem Documentation? (12/96)

=====

Article Created: 30 July 1996
Article Reviewed/Updated: 10 December 1996

TOPIC -----

I am attempting to use the modem that came installed in my Macintosh Performa 6400 computer. However, I am confused about some of the documentation that was included with the computer.

For example, the Apple Fax User's Guide and the Apple Address Book User's Guide refer to an application called, Apple Phone, that I should use to make phone calls through the modem. However, I cannot find this application on the hard disk or CD-ROM drive. Should I have this application on my computer? If not, which application should I use to make telephone calls?

Also, the Global Village Teleport User's Guide mentions GlobalFax software that I can use to send and receive faxes. However, I do not have this application either.

DISCUSSION -----

Apple Phone is not included with your computer; it has been replaced by the MegaPhone software program, which is documented in the MegaPhone User Guide. You can ignore all mention of Apple Phone in the documentation.

Also, you can ignore any references to the GlobalFax software in the Global Village Telport User's Guide because that software has been replaced by the Apple Fax software. Use the Apple Fax User's Guide for information on sending and receiving faxes.

You can use the TelePort User's Guide as a basic hardware guide. However, there are some sections which are not relevant to your computer setup, including:

- * Preface

Page xii: Disregard the referral to the GlobalFax User's Guide.

* Chapter 1: Introduction to Modem Commands

Page 3: Disregard the comment to the Global Village Scripts folder.

Page 4: Disregard the comment on how to adjust the card's volume.

Page 5: Disregard page 5.

* Disregard Chapter 2, Preparing for Basic Modem Use.

* Chapter 3: Communicating with Another Modem

Page 11: Disregard the reference to eWorld.

Page 12: The modem script referred to is not bundled with your computer. You can get a suitable script by downloading the Apple Remote Access 2.1 updater from the Apple Software Updates.

* Chapter 4: Using Error Correction and Data Compression

Page 24: Disregard the section starting with "Selecting an Error-Correction/Data-Compression..."

Page 25-28. Disregard all. Note that the AT command equivalents of the specific menu commands in the Global Village software are provided. These AT commands are also summarized in Chapter 5. You enter AT commands by using a terminal emulator, such as ClarisWorks.

* Chapter 5: Using TelePort Platinum V AT Commands

This entire chapter is generally relevant to your computer.

* Appendix A: Troubleshooting

Page 95: Ignore the section titled "Startup Problems."

* Appendix B: Product Specifications

This entire section is generally relevant to your computer.

* Appendix C: FCC and Industry Canada Information

This entire section is generally relevant to your computer.

* Appendix D: Warranty and Copyright

Article Change History:

10 Dec 1996 - Added additional information about specific chapters.

Macintosh Performa 6400:Restoring Cover Pages in Apple Fax(8/96)

Revised: 8/1/96
Security: Everyone

Macintosh Performa 6400:Restoring Cover Pages in Apple Fax(8/96)

Article Created: 31 July 1996
Article Reviewed/Updated: 2 August 1996

TOPIC -----

I recently resotred all the software to my Macintosh Performa 6400 series computer using the instructions in Chapter 7 of my Macintosh Performa User's Manual. However, now when I choose Quick Fax from the Windows menu in the Apple Fax program, an error appears stating that all of the cover pages were "moved or deleted." How can I restore the cover pages?

DISCUSSION -----

The information that follows applies only if you use the Restore All Software program and then want to use the Apple Fax program. You do not need this information if you use the Restore System Software program or if you initialize your hard disk and then use the Restore All Software program before using Apple Fax.

Note that you only need to follow these steps the first time you attempt to send a Quick Fax after each time you use the Restore All Software Program.

To resolve this error message, follow these steps:

Step 1

Click OK in the error message box that appears.

* A cover page appears.

Step 2

From the File menu, choose Open.

* The Open dialog box appears.

Step 3

In the Open dialog box, choose Desktop from the pop-up menu at the top.

Step 4

In the list that appears, double-click the hard disk to open it.

Step 5

In the same list, double-click the following folders as they appears: the Telecom Applications folder, the Fax Folder, and the Cover Pages folder.

* You will see two documents listed in the Cover Pages folder--Sample Cover Page and Standard Cover Page.

Step 6

Double-click the Sample Cover Page to open it.

* The Sample Cover Page appears.

Step 7

From the Cover Page menu, choose Install Cover Page.

Step 8

Go back to the File menu and choose Open again.

* The Open dialog box reappears, and again you see the Sample Cover Page and Standard Cover Page.

Step 9

Double-click the Standard Cover Page to open it.

* The Standard Cover Page appears.

Step 10

From the Cover Page menu, choose Install Cover Page.

Step 11

Close both cover pages by clicking each of their close boxes (located at the top left corner of each page).

Step 12

In the Quick Fax dialog box, click Cancel.

* The dialog box disappears.

Step 13

From the Windows menu, choose Quick Fax again.

* In the Cover Page pop-up menu in the Quick Fax dialog box, you see the Sample Cover Page and Standard Cover Page listed.

Macintosh Computers: 8x-Speed CD-ROM Drive & Vibration (8/96)

Revised: 8/1/96
Security: Everyone

Macintosh Computers: 8x-Speed CD-ROM Drive & Vibration (8/96)

=====

Article Created: 31 July 1996
Article Reviewed/Updated: 2 August 1996

TOPIC -----

Sometime when I play a CD-ROM disc in my 8x-speed CD-ROM drive that was included with my Macintosh computer, the computer appears to vibrate. What could be causing this?

DISCUSSION -----

The 8x CD-ROM drive reads CD-ROM discs very quickly, but because of the high rotation speed of the drive, some CD-ROM disc can wobble in the drive and cause the computer to vibrate. Some CD-ROM disc labels have artwork on them that can cause the CD-ROM's disc's weight to be slightly off-center. For example, the label on the CD-ROM disc may be noticeably thicker on one side than the other. A slightly off-centered CD-ROM disc can wobble in the drive and cause your computer to vibrate.

This vibration affects very few CD-ROM discs and does not damage your computer or the CD-ROM disc itself, but you should be aware of the vibration in case it occurs.

Reinstalling System 7.5.3 Revision 2 Issue (7/96)

Revised: 7/31/96
Security: Everyone

Reinstalling System 7.5.3 Revision 2 Issue (7/96)

=====

Article Created: 31 July 1996

TOPIC -----

I have already updated my system software to System 7.5.3 Revision 2 with the Revision 2 installer. Now I need to reinstall System 7.5.3 Revision 2, but I get this prompt when trying, "This system can not be updated. The system you want to update might be on a different disk. If you think this might be the case then click the 'Switch Disk' button below." How do I reinstall Revision 2?

DISCUSSION -----

This will happen with any Mac OS compatible computer having had System 7.5.3 Revision 2 installed on it.

Workaround

Use the System 7.5 Update 2.0 installer, and preform a custom installation of System 7.5.2 Update (under the System option). Then use the System 7.5.3 Revision 2 installer.

On computers which came with System 7.5.3 preinstalled (PCI Power Macintosh 7200/120, 7600/120, 8500/132/150, 9500/132/150) the System suitcase must be reinstalled before Revision 2 will reinstall. Therefore reinstall the original System software which came with the computer.

HyperCard 2.3.5 Read Me (7/96)

Revised: 7/31/96
Security: Everyone

HyperCard 2.3.5 Read Me (7/96)

=====

Article Created: 31 July 1996

TOPIC -----

This article is the HyperCard 2.3.5 ReadMe file.

DISCUSSION -----

Welcome to HyperCard 2.3.5

Please read this entire "Read Me" file. It contains important information and tips that will enhance your experience with HyperCard 2.3.5. We recommend that you print a copy.

INSTALLING HYPERCARD

To install HyperCard 2.3.5 on your hard drive, insert the disk called "HyperCard Installer," double-click the file called "Installer" and then follow the instructions on your screen.

The "Easy Install" option of the HyperCard Installer installs the version of HyperCard 2.3.5 that's optimized for your Macintosh computer.

If you have a Macintosh computer with a PowerPC upgrade card and the card is enabled, the "Easy Install" option will install the version of HyperCard that's optimized for any Macintosh. If the PowerPC upgrade card is disabled, the Installer will install the version of HyperCard that's optimized for a Macintosh computer with a 680x0 microprocessor.

You can choose which version of HyperCard to install by using the "Custom Install" option of the HyperCard Installer. This option gives you three choices: 1) HyperCard optimized for Macintosh computers with PowerPC microprocessors, 2) HyperCard optimized for Macintosh computers with 680x0 microprocessors, and 3) HyperCard optimized for any Macintosh. If you install one of these versions and

then change your mind, delete the version that you installed and run the Installer again.

SYSTEM AND MEMORY REQUIREMENTS

HyperCard 2.3.5 requires:

An Apple Macintosh, Power Macintosh, or PowerBook computer; QuickTime Tools require a 68020 or later microprocessor; text-to-speech function requires a 68040 or later microprocessor.

A hard disk drive.

At least 2MB of RAM; 4MB of RAM required for system software version 7.0 or later; 5MB of RAM recommended when using Color Tools; 8MB of RAM required for Macintosh Computers with PowerPC microprocessors.

HyperCard's memory partition should be set to at least 2200K to use the Color Tools (5120K on Macintosh Computers with PowerPC microprocessors with virtual memory off). HyperCard's memory partition should be set to 3072K, or more, to use the Color Painting Tools (5120K on Macintosh Computers with PowerPC microprocessors with virtual memory off).

SOFTWARE REQUIREMENTS

HyperCard 2.3.5 requires system software version 6.0.5 or later. System software 7.0 or later is required for AppleScript and the Color Paint Tools. The HyperCard Button Tasks and the stand alone application builder require system software 7.0 together with either the AppleScript or the QuickTime system extension. The Button Tasks will also work with system software 7.1 or later with or without the QuickTime or AppleScript system extensions. On Macintosh computers with PowerPC, the HyperCard Button Tasks and the stand alone application builder require the ObjectSupportLib file. This item will automatically be installed in your system extensions folder when you choose easy install or when you choose custom install and install AppleScript.

QuickTime Tools requires the QuickTime system extension.

Text-to-speech requires the Speech Manager system extension (included) or the PlainTalk software package.

Multilingual HyperCard applications may require WorldScript software and/or international versions of AppleScript software.

WorldScript software requires system software 7.1 or later.

BUTTON TASK REQUIREMENTS

On Macintosh computers with PowerPC microprocessors, the Button Tasks require the ObjectSupportLib file. This item will automatically be installed in your

system extensions folder when you choose easy install or when you choose custom install and install AppleScript.

On Macintosh computers with 680x0 microprocessors, the Button Tasks require system software 7.0 together with either the AppleScript or the QuickTime system extension. The Button Tasks will also work on Macintosh computers with 680x0 microprocessors running system software 7.1 or later with or without the QuickTime or AppleScript system extensions.

The Movie Button Task requires the QuickTime system extension. The task will not appear if the QuickTime system extension is not present.

The Speech Button Task requires the Speech Manager system extension (included) or the PlainTalk software package. The task will not appear if the Speech Manager system extension or the PlainTalk software package is not present.

The Sound Task requires sound input hardware in order to record.

NOTES ON USING HYPERCARD 2.3.5 FOR THE FIRST TIME AFTER INSTALLATION

The first time you use HyperCard 2.3.5, it is possible that double-clicking a stack that you already have on your machine will fail to launch HyperCard, or will launch an earlier version of HyperCard. If this happens to you, simply open the HyperCard 2.3.5 folder. Once you have done this, double-clicking a stack will launch HyperCard 2.3.5.

It is also possible that you will not see stack icons on the stacks on your system after you install HyperCard 2.3.5 for the first time. If this happens to you, simply open the HyperCard 2.3.5 program folder and restart your Macintosh computer. After you have restarted, the stack icons will appear correctly.

NEW HYPERCARD FEATURES

HyperCard 2.3.5 contains some new and exciting features. For this release of HyperCard we have added:

- Support for Macintoshes with PowerPC microprocessors. This includes the ability to generate stand alone applications which are optimized for Macintoshes with PowerPC microprocessors.
- New Button Tasks which allow you to generate HyperTalk scripts without scripting.

We have included tasks for:

- playing movies
- playing and recording sounds
- moving from card to card
- using text-to-speech
- adding visual effects
- opening applications

We expect third-party developers to develop additional button tasks.

- Text-to-Speech capabilities. (only for Macintoshes with 68040 or better microprocessors)
- Enhancements to the Color Tools including a new color painting environment.

NOTES ON HYPERCARD

Users with 9-inch screens may have problems viewing the task window associated with the new Button Tasks. When editing a stack with standard size cards, if you open the task window by choosing the "Tasks..." button in the Button Info dialog, and then bring another window forward, the tasks window will go behind the card window. It will look as though the task window has disappeared even though it is still present. Select "Next Window" to bring the task window forward.

The tilde key "~" no longer takes you back in HyperCard. Command-tilde will still take you back.

HyperCard 2.3.5 includes the necessary system extension for performing text-to-speech. The Installer will only install this software on Macintoshes with 68040 or better microprocessors. Text-to-speech is restricted to Macintoshes with 68040 or better microprocessors.

In low memory situations, stacks with card sizes larger than 512 by 342 pixels will not open to their full size. Additionally, you will not be able to use HyperCard's Color Paint Tools or the Color Tools, and you will not be able to print cards.

External commands may cause HyperCard to think that it is in a low memory state. If you are using system 7.5 and your stacks are not opening to full size after increasing HyperCard's memory partition, try disabling the Macintosh Easy Open extension.

NOTES ON COLOR TOOLS

The Color Paint Tools require system software 7.0 or greater.

The Color Paint Tools can require large amounts of memory depending on the size and bit depth of the pictures that you are editing or creating. We recommend against using the Color Paint Tools on a Macintosh computer with less than 5MB of RAM or when HyperCard has a partition smaller than 3072K. Many of the Color Paint operations will not work properly in low memory. If you are seeing frequent messages about low memory while using the Color Paint Tools, exit HyperCard and increase its memory allocation. We recommend increases of at least 300K. Continue increasing the allocation until you no longer see the out of memory messages or until you have exceeded the available memory on your machine.

For instructions on how to increase HyperCard's memory allocation, see "Preparing a Color Standalone Application" in Chapter 3 of the "Getting Started" guide.

The Color Tools Demo in the Color Tools Stack does not work when the stack has been locked with the Finder.

The Color Tools stack requires a monitor with at least 256 colors or shades of gray.

We recommend against coloring your Home stack. If not scripted correctly, a colored Home stack will cause HyperCard to run slower than it would with a non-colored Home stack.

When using the Color Paint Tools, operations that cause the picture to extend beyond the bounds of the window may cause parts of the image to be lost. This happens when rotating and scaling. You can prevent this problem by expanding the size of the window before performing the operation. Note that expanding the window will increase the memory needed to display the picture.

After editing a picture that has been placed on a card, the picture may be displayed in a different scale. If you want the picture to be displayed at a 1-1 scale, double-click the picture and select "Original Size."

With the "Rotate by degree" feature of the Color Paint Tools, rotations are measured from the orientation of a graphic at the time it was selected. If you rotate a selection and then rotate it again, the rotations do not accumulate. If you want cumulative rotations, deselect the graphic after rotating it the first time, re-select it and rotate it again.

If you place pictures onto cards and subsequently delete the picture resource from the stack, you must ensure that each instance of the picture in the stack is also deleted. Otherwise you will see the following message at the location of each instance of the deleted picture in the stack: "Cannot display this image. There may not be enough memory or the image could not be found."

The AddColor XCMD has an undocumented selector, "Depth," which returns the current bit depth of the color buffers in the result.

When a stack colored with Color Tools 1.0 is opened for the first time with Color Tools 2.0, the color will disappear momentarily. The disappearance occurs during the conversion of your stack from AddColor 1.0 to AddColor 2.0. Thereafter the color will be displayed normally.

BUILDING STANDALONE APPLICATIONS WITH COLOR

When color is first applied to a HyperCard stack using Color Tools, a set of resources are copied into the stack. The copying of resources is not actually complete until the stack is closed. If a stand alone application is built from the colored stack before the resources have been copied, the stand alone application will not work correctly. To avoid this problem, be sure that you

have closed and reopened your colored stack at least once before turning it into a stand alone application. You should also be certain that the default partition of your stand alone application is set to at least 2048K in order for it to display color properly.

CHANGES TO THE GETTING STARTED GUIDE

On page 54 the manual states that images you create or edit in the PICT editor are automatically saved as resources in the current stack. This is true unless you are editing a PICT file which has been placed on a card. Changes made to PICT files which have been placed on a card will be reflected in the file itself and will not be saved as resources in the stack.

On page 57 the manual states that double-clicking the current color indicator in the Color Paint Tools palette will launch the color picker. Actually, it will allow you to edit patterns or gradients.

On page 67 the manual refers to the Paint menu. There is no Paint menu, the specified items are in the Options menu.

On page 71 the picture of the palette is slightly different from the one you will see in the software. The functionality is the same. Additionally, the manual states that you can import MacPaint images with the PICT editor. This is not true. Only PICT files can be imported into the PICT editor. If you wish to use and color a MacPaint file, you can Cut/Paste it into an edit window and then color it.

On page 76 the instructions for quitting the Color Paint Tools are incorrect. To exit the Color Paint Tools, close all paint windows, or choose "Close Paint Tools" from the "File" menu. Closing the Color Paint Tools will return you to the color editor environment.

CHANGES TO THE HYPERCARD REFERENCE MANUAL

On page 3-22 the Reference Manual describes using "Effects" as follows:

1. Choose the Button Tool and double-click the Next button.

The Button Info dialog box appears

2. Click the Effect button.

While the Button Info dialog box does appear, the Button Info dialog box does not display the "Effect..." button unless the option key is held down while double-clicking the button.

On page 6-37 the Reference Manual describes using "Effects" as follows:

2. Double click the Button

The Button Info dialog box appears

3. In the Button Info dialog box, click Effect.

While the Button Info dialog box does appear, the Button Info dialog box does not display the "Effect..." button unless the option key is held down while double-clicking the button.

Pages 2-29, 4-20, 6-3, 6-17 of the HyperCard Reference Manual shows an incorrect depiction of the Button Info dialog box when a button is Option-Double Clicked. On these pages, the position of the "LinkTo..." and "Effect..." buttons are transposed with the "Icon..." and "Contents..." buttons in the Button Info dialog box.

NOTE: Appendix B, page 141 of the Getting Started Guide documents the replacement of the "LinkTo..." and "Effect..." Buttons with the "Tasks..." button in HyperCard 2.3.5.

Avid Cinema: Description (8/96)

Revised: 8/1/96
Security: Everyone

Avid Cinema: Description (8/96)

Article Created: 31 July 1996
Article Reviewed/Updated: 2 August 1996

TOPIC -----

This article contains a description of Avid Cinema, a digital video editing system for Macintosh Performa and Power Macintosh computers.

DISCUSSION -----

Discover how much fun movie making can be with Avid Cinema!

This complete hardware and software solution from Apple lets you create professional-looking movies right on your Macintosh computer - easily and inexpensively.

Avid Cinema is designed especially for people with no prior video editing experience. It guides you through making your own movies in four easy steps.

First, design your own movie by using the storyboard templates provided for home, school, and business projects. Each template suggests camera shots as well as filming and editing tips to help create an interesting and exciting movie.

Second, shoot your video and bring it into your Macintosh computer. Third, use Avid Cinema's editing features to combine your video clips, create interesting transitions between clips, and add titles and credits. Finally, record your finished movie on videotape, or save it as a QuickTime movie for use in multimedia presentations or on a World Wide Web site.

With Avid Cinema you can produce a high-quality videotape with the click of a button, then hand out copies to classmates, friends, or customers. Produce movies of birthday parties, weddings, graduations, reunions, recitals, sporting events, award ceremonies, and other important occasions. Or create video presentations for association or professional group meetings.

Schools can use Avid Cinema to publish video yearbooks or to capture highlights

of sports, music, and arts events. Students can use it to design attention-getting multimedia reports, and teachers to create virtual field trips.

Avid Cinema can help businesses produce sales presentations and training tapes quickly and easily. These important materials can be up to date at all times, because it's easy to make new tapes whenever information changes.

Avid Cinema: It's never been so easy - or so much fun - to edit and publish movies for home, school, or work.

What's In The Box?

=====

Avid Cinema ships with the following items in the box:

- * Avid Cinema card
- * Avid Cinema software [CD]
- * Two triple-head composite video cables
- * One S-Video cable
- * Y-adapter cable
- * Getting Started manual
- * User's Guide

Features

=====

Easy to use

- * Provides ready-to-use storyboard templates with suggested camera shots and editing tips
- * Requires no video editing experience
- * Lets you import video, add text, record live voice-over, and add transitions with a simple click of the mouse

Versatile

- * Includes more than 20 storyboards for home, school, and business projects
- * Allows you to incorporate video, QuickTime movies, digital images, sound, voice, and other media into your movies
- * Accepts input from a variety of sources, including a VCR, a camcorder, the Internet, audio and photo CDs, and a microphone
- * Lets you save movies to videotape or as QuickTime files optimized for presentations, World Wide Web sites, or Internet exchange

Sophisticated

- * Provides Motion JPEG compression and decompression, so you can view and edit movies frame by frame just as professionals do
- * Adds impact to your movies with more than two dozen special effects,

- including popular transitions such as gradual fade or clockwipe
- * Supports multiple audio tracks, so you can integrate music from audio CDs and add your own voice-overs
- * Lets you type in titles or scrolling credits

Ordering Information

=====

Avid Cinema

Order No. M4561LL/A

- * Avid Cinema card
- * Avid Cinema software
- * Two triple-head composite video cables
- * One S-video cable
- * Y-adapter cable for providing two-channel audio from your Macintosh Performa to a VCR
- * Getting Started manual
- * User's guide

This article contains the technical specifications for Avid Cinema, a digital video editing system for Macintosh Performa and Power Macintosh computers.

DISCUSSION -----

Avid Cinema Card Specifications
=====

Video specifications

- * 30-frames-per-second (fps) Motion JPEG compression/decompression at 320 by 240 pixels
- * 60 fields-per-second for interlaced video (television)
- * Vertical and horizontal interpolation and filtering for high-quality output of up to 640 by 480 pixels
- * NTSC output in composite or S-video format

Environmental requirements

- * Operating temperature: 50 degrees to 104 degrees F (10 degrees to 40 degrees C)
- * Storage temperature: *40 degrees to 116 degrees F (40 degrees to 47 degrees C)
- * Relative humidity: 5% to 95% noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Size and weight

- * Height: 7 in. (17.7 cm)
- * Width: 4 in. (10.1 cm)

* Weight: 0.3 lb. (0.14 kg)

System requirements

* One of the following systems:

- A PowerPC processor-based Apple Macintosh Performa or Power Macintosh computer with a PCI expansion slot (such as the 5400 or 6400 series) and the Apple Video System
- An Apple Power Macintosh computer with built-in composite or S-video input and a PCI expansion slot (such as the 7500, 7600, or 8500 series)

* 24 MB of RAM

* Macintosh system software version 7.5.3 or later (system software version 7.5.3 included)

* QuickTime 2.5 or later software (QuickTime 2.5 included)

* 1 GB hard disk

* One available PCI expansion slot

Avid Cinema Software Specifications/Description

=====

* Four integrated functions

- Storyboard
- Bring video in
- Edit movie
- Send movie out

* Storyboard-driven interface

* Multiple media input formats

- Camcorder
- VCR
- QuickTime movies
- Digital pictures (PICT files)
- Voice input from a microphone
- Audio CDs

* More than two dozen special effects

* Multiple movie output formats

- VHS tape
- QuickTime movie optimized to incorporate into presentation software programs
- QuickTime movie optimized to send across the Internet or publish on a World Wide Web site
- QuickTime movie optimized to save on a double-speed CD-ROM drive
- QuickTime movie optimized to save on a quadruple-speed CD-ROM drive
- Avid Cinema format optimized to export into a third-party application for continued editing

* Storage Requirements

Begin_Table

Disk space required to edit

Final movie (approximate)

-----	-----
5 min.	225 MB
10 min.	450 MB
15 min.	675 MB
20 min.	900 MB
25 min.	1.1 GB
30 min.	1.35 GB

Macintosh Performa 6400: MegaDial Manual Won't Open (1/97)

Revised: 1/31/97
Security: Everyone

Macintosh Performa 6400: MegaDial Manual Won't Open (1/97)

=====

Article Created: 31 July 1996
Article Reviewed/Updated: 31 January 1997

TOPIC -----

I am attempting to open the MegaDial Manual that was included with my Macintosh Performa 6400 series computer. However, each time I do so, an error message appears stating: "This application has been damaged and should be replaced with a fresh copy from your locked master disk." The only options in this error dialog are Continue or Quit. If I click Continue, a Type 15 error occurs. I tried replacing the copy on the hard disk with the one on the Performa CD, but the error still occurs. How can I resolve this?

DISCUSSION -----

The MegaDial Manual is corrupted, so a new version of the file is required. Apple has released an updated version of the MegaDial manual which is available for download from Apple's software update locations.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:
31 Jan 1997 - Added information on where to find the manual.

Macintosh Performa 6400: Demo CD and Restore CD (8/96)

Revised: 8/1/96
Security: Everyone

Macintosh Performa 6400: Demo CD and Restore CD (8/96)

=====

Article Created: 31 July 1996
Article Reviewed/Updated: 2 August 1996

TOPIC -----

My Macintosh Performa 6400 included two CD-ROM discs labeled Macintosh Performa CD. Also, when I insert these discs into the computer, they both appear as "Performa CD". They do have slightly similar disk structures, but I am having difficulty determining the differences between these two discs.

DISCUSSION -----

Although the names of these CD-ROM discs appear to be the same, the discs do have some distinguishing characteristics and contain quite different information.

Demo CD

=====

The black-colored disc contains the restoration software for the demo and tutorials. It contains only those applications and files that assist you in learning about and using your computer. You only need to use this disc if you are using the Performa Demo or you need to re-install the Performa Demo or other tutorial programs.

The complete name on this disc is: Macintosh Performa 6400 Series Guided Tour, and it is part number 691-1105-A. Use this disc if you need to re-install or use the Performa Demo and tutorial applications. The primary contents of this disc are as follow**:

- * About the Guided Tour CD
- * Disk First Aid
- * Drive Setup
- * Restore Guided Tour (folder)
- * Performa Demo Extras (folder)
 - Hands on Activities
 - QTVR folder

- Surf the Internet folder
- Text to Speech folder
- Video Editing folder
- Software Overview
- * Disk Images
 - Disk Copy
 - Using Disk Copy Read Me
 - Disk Tools image
- * Hard Disk Files
 - System Folder Files
 - At Ease Items
 - Tutorial setups)
 - Extensions
 - Tutorial Guide
 - Launcher Items
 - •Learning
 - Startup Items
 - Launch Performa Demo

Restore CD

=====

The red-colored disc contains the restoration software for your hard disk and the individual files from your hard disk. It contains all the applications, documents, and system software that was installed on the computer when you first purchased it. Whenever you need to re-install an application, other than the Performa Demo or other tutorial programs, you should use this disc.

The complete name on this disc is: Macintosh Performa 6400 Series Performa Software, and it is part number 691-1019-A. Use this disc if you need to re-install or use the Performa Demo and tutorial applications. The primary contents of this disc are as follow**:

- * About This CD
- * Disk First Aid
- * Drive Setup
- * Restore All Software (folder)
- * Restore System Software (folder)
- * Disk Images
 - Disk Copy
 - Using Disk Copy Read Me
 - Disk Tools image
- * Hard Disk Files
 - Contains all of the files that were originally installed on the hard disk.

**Note: These listings do not reflect the complete contents of these two CD-ROM discs. They are meant to provide a general comparison between the contents of the two CD-ROM discs.

Macintosh System 7.5, version 7.5.3: Description (8/96)

Revised: 8/13/96
Security: Everyone

Macintosh System 7.5, version 7.5.3: Description (8/96)

Article Created: 1 August 1996
Article Reviewed/Updated: 13 August 1996

TOPIC -----

This article describes Macintosh System 7.5, version 7.5.3.

DISCUSSION -----

Macintosh System 7.5, version 7.5.3 is the latest release of the Mac OS. It includes more than 50 enhancements that make personal computing easier than ever, so you can be more productive than ever. System 7.5 is ideal for nearly every Mac OS user -- plus it offers software optimized for PowerPC-based systems.

Macintosh System 7.5 gives you a wealth of capabilities for general productivity, printing, collaboration, document appearance, and multimedia.

To boost productivity, an enhanced Apple menu accelerates the process of accessing menus, copying files, opening windows, and launching applications. Apple Guide provides easy-to-follow, step-by-step instructions for unfamiliar system tasks. Using AppleScript, you can automate routine or complex tasks, or combine functions from several applications to create custom solutions.

When it's time to print, you can simply drag any file onto a desktop printer icon. Check the status of jobs in the print queue -- or change their order -- by double-clicking on the same icon.

Macintosh System 7.5 gives you many ways to collaborate with others. You can work with DOS disks just as if they were Mac OS disks. Open and edit most Mac OS, DOS, and Windows documents even if you don't have their original applications. Or save a Mac OS file as a document that can be opened and printed by other System 7.5 users without requiring the same fonts or applications.

PowerTalk collaboration software provides built in electronic-mail services. And Open Transport software brings you enhanced network connectivity with built in

TCP/IP protocols and support for multiple network configurations.

In conjunction with new or updated applications, the sophisticated font and graphics capabilities of QuickDraw GX can make your documents look better than ever. And with QuickTime software, Apple's industry-leading multimedia technology, you can easily incorporate video, animation, images, and sound for more effective, attention-getting documents.

Macintosh System 7.5 version 7.5.3: It upgrades your computer to new levels of compatibility, productivity, and ease of use.

Features

Improved performance and efficiency

- Easily access recently used documents from the Apple menu
- Take advantage of enhanced Apple desk accessories and tools

Interactive assistance and customization

- Get step-by-step assistance with Apple Guide
- Use AppleScript application program to automate tasks and create custom multi-application solutions

DOS/Windows file compatibility

- Use Macintosh PC Exchange to work with DOS disks and files
- Open and edit Mac OS, DOS, and Windows documents using available applications

Advanced printing

- Check and modify print queues via desktop printer icons
- Share or restrict access to printers
- Save documents that other System 7.5 users can open and print without requiring the original fonts or applications

Collaborative technologies

- Receive electronic mail from many sources in a single desktop mailbox using PowerTalk software
- Sign documents electronically to streamline your approval process
- Connect to TCP/IP hosts -- including ones on the Internet
- Create and switch among multiple networking configurations quickly and easily with Apple Open Transport software

Multimedia capabilities

- Use QuickTime software to integrate video, animation, high-quality still images, and sound into all types of documents

Special features for PowerBook users

- Optimize battery life with intelligent energy management
- Synchronize files with other computers, hard disks, and servers
- Change frequently used Control Panel settings from one convenient Control Strip

Macintosh System 7.5, version 7.5.3: Specifications (8/96)

Revised: 8/13/96
Security: Everyone

Macintosh System 7.5, version 7.5.3: Specifications (8/96)

Article Created: 1 August 1996
Article Reviewed/Updated: 13 August 1996

TOPIC -----

This article provides the technical specifications and order information for Macintosh System 7.5, version 7.5.3.

DISCUSSION -----

Technical Specifications

Enhanced Apple Menu

- Hierarchical Apple menu provides improved access to nested items and instant recall of recently used documents, applications, and servers
- Improved Find File command lets you open files from the Find File window
- The Sticky Memos feature (see screen shot) lets you create on-screen reminder messages
- System and application folder locking prevents accidental deletion of important files
- Scrapbook, Note Pad, and SimpleText applications let you move information between documents by simply selecting, dragging, and dropping
- WindowShade feature (see screen shot) reduces screen clutter by letting you collapse windows to access other windows behind them -- without closing documents
- Includes a menubar clock, automatic power off, and audio CD software

Apple Guide

- Interactive, step-by-step guidance for system and application tasks (applications must support Apple Guide)
- On-screen coachmarks for the next required action, skipping any unnecessary steps
- Customizable to meet the unique training and support needs of your organization (requires the Apple Guide Maker Authoring software, available separately)

AppleScript

- Create custom solutions by linking functions from different applications and from the Finder
- Use Script Editor to record your actions to automate tasks

Macintosh PC Exchange and Macintosh Easy Open

- Allow you to work with DOS-formatted disks as though they were Macintosh disks
- Let you open and edit Mac OS, DOS, and Windows files even when you don't have the original application (appropriate file translators required)

Open Transport

- Readies your Macintosh system to connect with other systems using industry-standard TCP/IP networking protocols
- Lets you create and switch between multiple networking configurations without rebooting your computer

PowerBook utilities

- Automatically switch your PowerBook to full performance when plugged in, and conserve energy when it isn't, to extend battery life
- Synchronize files, folders, or disks between PowerBook computers and other Mac OS-based systems -- locally, over a network, or using a floppy disk
- Provide a Control Strip for convenient access to AppleTalk Network system on/off, battery monitor, file sharing, hard disk spindown, power management, "Sleep Now," sound volume, and video mirroring functions (also available on some desktop computers)

QuickTime

- Enables you to integrate graphics, sound, video, and animation into documents (requires application software that supports QuickTime)

OpenDoc

- Lets you extend the functionality of OpenDoc-aware applications by adding new software components -- called "parts" -- that can be dragged-and-dropped into documents (requires application software or parts that support OpenDoc)

QuickDraw GX

- Lets you create portable "print and view" documents from any application (System 7.5 and QuickDraw GX also required on destination system)
- Displays desktop printer icons that allow you to quickly check the status of and change print queues
- Incorporates Apple's ColorSync technology for consistent colors from scanner to display to printer
- Supports Apple TrueType and Adobe Type Manager GX (ATM GX) font technologies
- Includes seven QuickDraw GX fonts

PowerTalk

- Provides a universal desktop mailbox for all electronic correspondence, whether it's being exchanged between other personal computers, the

Internet, on-line services, fax machines, or even voice-mail systems.

- Includes Personal Catalog, which allows you to store names and electronic addresses of the people you collaborate with regardless of the way you communicate.
- Includes Key Chain, which stores your login names and passwords for the network services you use the most and protects them under a single password

System requirements

- Apple Macintosh Plus or later, Power Macintosh, or PowerBook computer
 - 68020, 68030, 68040, or PowerPC microprocessor required for QuickTime, PowerTalk, and QuickDraw GX
 - 68030, 68040, or PowerPC microprocessor required for OpenDoc and Open Transport
- Minimum 8MB of RAM required for installation of full System 7.5 suite (16MB on Power Macintosh models)
 - 4MB of RAM permits minimum installation of System 7.5 features except OpenDoc, Open Transport, PowerTalk, and QuickDraw GX (8MB on Power Macintosh models)
- Hard disk with up to 40MB of available space (depending on your system and configuration) to install System 7.5
- One of the following installation media:
 - Apple SuperDrive 1.4MB floppy disk drive for installation from floppy disks
 - CD-ROM drive for installation from CD-ROM

Ordering Information

Macintosh System 7.5, version 7.5.3 on CD-ROM disc For one user

Order No. 504074U

- System software version 7.5.3 and utilities
- OpenDoc software
- Open Transport software
- PowerTalk software
- QuickTime software
- QuickDraw GX software
- Upgrade Guide

Included on the CD are Apple and third-party applications and utilities that enhance and complement Macintosh System 7.5 capabilities.

Macintosh System 7.5, version 7.5.3 on 1.4MB disks For one user

Order No. 401000U

Same contents as CD-ROM version.

Color OneScanner 600/27: Requires Display of 640x480 (8/96)

Revised: 8/2/96
Security: Everyone

Color OneScanner 600/27: Requires Display of 640x480 (8/96)

Article Created: 1 August 1996

TOPIC -----

I am trying to use an Apple Color OneScanner 600/27 with a Macintosh 12-in. RGB Display. When I open the Dispatcher software, I am not able to scan an image because the controls are off the screen. How can I use the dispatcher software?

DISCUSSION -----

The Dispatcher software which comes with the Apple Color OneScanner 600/27 requires a minimum resolution of 640x480. Since the Macintosh 12-in. RGB Display only has a resolution of 512x384, you cannot use it with the Dispatcher software. You must use a display capable of 640x480 or greater (including PowerBook computers).

One other thing to keep in mind, is that ColorSync was designed to work with a resolution of 640x480 or greater. Since the Macintosh 12-in. RGB does not work at that resolution, even if you were able to scan images, the colors you get may not always be what you expected.

PC Compatibility Cards: DPMS Support (8/96)

Revised: 8/1/96
Security: Everyone

PC Compatibility Cards: DPMS Support (8/96)

Article Created: 1 August 1996

TOPIC -----

In Appendix C, pages 181-182 of the "PC Compatibility Card User's Manual for the 12-inch Card" it is stated that Display Power Management System (DPMS) is not supported with Apple's PC Compatibility Cards.

However, it appears to work fine on my Power Macintosh 8500/120 computer with a 12 Inch PC Compatibility Card and an Apple Multiple Scan 15 display under Windows 3.1 and Windows 95.

Is the manual wrong? After all, it does appear to work on my system.

DISCUSSION -----

DPMS or any kind of power management is not supported with Apple's PC Compatibility cards. Power management control of any kind is intentionally disabled in ROM.

When you set up and enable DPMS by using ATI Technologies' driver software, the energy saving features apply only to the monitor, not the PC Compatibility card. In other words, your monitor goes into energy saving mode (blank), but PC environment is still active.

Even if DPMS works on Apple's PC Compatibility cards while running Windows 3.1 and Windows 95, Apple does not support it. Apple can only recommend using any power-management features in Macintosh environment.

HyperCard 2.3.5 Updater: Updater on MacWorld CD Fails (8/96)

Revised: 8/2/96
Security: Everyone

HyperCard 2.3.5 Updater: Updater on MacWorld CD Fails (8/96)

=====

Article Created: 2 August 1996

TOPIC -----

I received a CD-ROM at the MacWorld Expo in Boston in August, 1996. I was using the HyperCard 2.3.5 Updater on the disc to update the Hypercard applications on all my computers. The updater has been failing to update the HyperCard application on several but not all of my Power Macintosh computers. When it fails, it gives the message, "An error prevented the update from completing. Invalid file selected for updating."

What could be causing this intermittent failure?

DISCUSSION -----

The problem you are experiencing occurs only with the HyperCard 2.3.5 Updater included on approximately 10,000 CD-ROMs distributed at MacWorld Boston in August 1996. The CD-ROM with the troublesome HyperCard updater is titled "The Apple Services CD - August 1996 Edition".

The issue only occurs on Power Macintosh or native or fat binary versions of the HyperCard 2.3 or 2.3.3 application. If you originally did an Easy Install of HyperCard 2.3 or 2.3.3 on your Power Macintosh, a few non-critical resources were left out of the HyperCard application. If you performed a custom install, these resources are included.

When you try to use the updater to update the HyperCard application that does not have these resources, the HyperCard 2.3.5 Updater will not recognize the application and will fail to update it returning the message "An error prevented the update from completing. Invalid file selected for updating."

To resolve this issue, you can re-install HyperCard 2.3 or 2.3.3 using the Custom Install option, and then use the HyperCard 2.3.5 Updater. Alternatively, you can download the corrected version of this updater from <http://www.info.apple.com/swupdates/>.

Macintosh Performa 6400: Non-Supported Video Resolutions (8/96)

Revised: 8/2/96
Security: Everyone

Macintosh Performa 6400: Non-Supported Video Resolutions (8/96)

=====

Article Created: 2 August 1996

TOPIC -----

I have a Macintosh Performa 6400 series computer and I am confused by the resolutions available to me using the AppleVision 1710AV Display. The Technical Information Guide provides a list to me, but there are more available to me. Why?

DISCUSSION -----

There are two supported resolutions using the Macintosh Performa 6400 series computer with the AppleVision 1710AV display; 832x624 75Hz, and 640x480 67Hz.

When you use the Display control panel other VGA/SVGA resolutions appear in *italics*.

When using the Macintosh Performa 6400 Series computer with most Apple displays, there will be more resolutions available than what the display supports. All non-supported resolutions appear in *italics*.

These multiple resolutions are available to support a larger number of Apple and non-Apple multiple scan displays. You should check the technical information for the display you have to confirm which resolutions are supported by your display. Although some Apple displays may also work with non-supported resolutions, their performance is not optimal.

The Macintosh Performa 6400 supports resolutions up to 1024x768 72Hz (maximum). Although some Apple Multiple Scan displays support higher resolutions, 832x624 or 1024x768 will be the highest resolution available depending on which multiple scan display is used.

Using Non-Macintosh Resolutions
=====

When you select a non-Macintosh resolution (VGA/SVGA resolution), a dialog

appears asking you to confirm the display image is OK. If you select OK, the new resolution is selected. If you do not select OK, the Mac OS reverts to previous resolution after a few seconds. This is done in case an incompatible video resolution is selected. The dialog does not appear if you select a standard Macintosh video resolution (640x480 67Hz or 832x624 75Hz).

Some resolutions will display "scrambled", distorted, large, small, or no image. This may happen when an unsupported resolution for a particular display is selected in the Displays control panel. If the image is stable but the performance of the image is not acceptable, one of the supported video resolutions should be used for the particular display connected to the Macintosh Performa 6400 computer.

If a resolution has been selected that produces an unusable image on the display and are not able to select another resolution in the control panel or control strip, you need to reset the Non-volatile RAM (NVRAM).

Resetting NVRAM =====

Turn off your Macintosh Performa 6400 or Choose Shut Down from the Special menu.

NVRAM can be cleared by holding down the Command-Option-P-R keys simultaneously as soon as possible after hitting the power-on key. It happens BEFORE you see the gray screen. Once the gray screen appears, the PRAM is cleared at the same point as it was in previous machines.

One very important difference is that NVRAM is not cleared during a warm or soft restart (by selecting Restart from the Special menu), whereas PRAM is cleared in that case.

Macintosh Performa 6400: System 7.5.3 Revision 2.1 (8/96)

=====

Article Created: 5 August 1996
Article Reviewed/Updated: 6 August 1996

TOPIC -----

I have a Macintosh Performa 6400/200 computer, and I noticed that in About This Macintosh, the system software version is "System 7.5.3 Revision 2.1". What is the difference between System 7.5.3 Revision 2 and System 7.5.3 Revision 2.1?

DISCUSSION -----

There were two changes to System 7.5.3 Revision 2 for the Macintosh Performa 6400/200 and 6400/180, which resulted in System 7.5.3 Revision 2.1.

The first is LocalTalk DMA 1.0.1, which resolves an issue with transferring files over LocalTalk.

The second change for System 7.5.3 Revision 2.1 is a fix for the video driver. This was to correct an issue with remaining screen bitmap artifacts when the computer was put to sleep when connected to a 15-inch display.

System 7.5.3 Revision 2.1 should only be used on the Performa 6400/200 and 6400/180 computers.

Power Macintosh 5200 & 5300: Installing TV/FM Tuner Card (8/96)

=====

Article Created: 5 August 1996

TOPIC -----

I purchased an Apple TV/FM Tuner Card, and I want to install it into my Power Macintosh 5200 computer. However, the rear plastic bezel covering the logic board does not have holes for both antennas. Is it possible to use the TV/FM Tuner Card in the Power Macintosh 5200?

DISCUSSION -----

Yes, it is possible to use the Apple TV/FM Tuner Card in the Power Macintosh and Macintosh Performa 5200 and 5300 series computers. You need to ask an Apple-authorized service provider to order a new rear I/O Door for you which has the necessary access holes for both antennas.

The Apple service part number for the rear I/O Door is 922-2190.

DOS Compatible Card: Windows 95 and NetBEUI (8/96)

=====

Article Created: 5 August 1996

TOPIC -----

This article describes how to configure NetBEUI with Windows 95 for a DOS Compatibility Card.

DISCUSSION -----

NetBEUI is a simple and efficient protocol that is still well suited for use on work group size networks. It is not capable of routing (since it does not understand network numbers) so its use does have limits. It is often implemented along with TCP/IP on Windows clients, with NetBEUI used on the local network and TCP/IP used for the other side of routers.

Windows 95 manages all network configuration in the "Network" control panel. Locate the "My Computer" icon on the screen and double-click it to open.

- 1) Open the Control Panel folder to find the Network control panel, double-click the Network control panel to open it.
- 2) Windows 95 requires the installation of at least 3 elements to make a network connection, an Adapter, Client, and Protocol. Start the installation by choosing an adapter. Click the "Add..." button in the Network control panel.
- 3) Choose Adapter and click the "Add..." button. You will load the NDIS driver provided on the DOS Compatibility Installer disk by clicking the "Have Disk..." button, informing Windows 95 that the driver is on a separate disk.
- 4) Use the default location, "A:\", provided in the Install From Disk dialog box. Insert the "PC Software" floppy disk, part of the PC Compatibility Card installer software disk set. Click the OK button and Windows 95 will scan the floppy in drive A: for possible drivers.

- 5) When the scan has completed, you will be presented with a list of the drivers found on the floppy.
- 6) Choose the only option you should see, "PC Card Network Driver (NDIS2)", and click the OK button. Windows 95 will read the driver from the floppy disk and return to the Control Panel display, which should now contain entries for two Clients, the network adapter (you just loaded), IPX/SPX protocol, and the NetBEUI protocol.

NOTE: The IPX/SPX protocol stack is based on Novell's original implementation, however, it is not the same as Novell's original implementation. If you were loading IPX/SPX for NetWare connectivity, you would be selecting "Novell Compatible IPX Protocol"

- 7) Choose the IPX/SPX-compatible Protocol and click the Remove button. This removes the protocol and Client for NetWare Networks.

Now you have a working configuration. The final step is to verify the setup of the remaining components.

- 8) First, confirm the Identification information of the computer by selecting the "Identification" tab.

**** DO NOT CLICK OK AFTER THIS STEP! ****

Verify that the entries for Computer name, Workgroup, and Computer Description are satisfactory.

IMPORTANT: Be sure to check this information. It must be compatible with other computers on the network, therefore these values are often supplied by your network administrator.

**** DO NOT CLICK OK YET! ****

- 9) Next configure the Client component. Re-choose the Configuration tab to display the network configuration. Choose "Client for Microsoft Networks" and click the "Properties..." button.

Select the "Logon validation" checkbox which instructs the computer to Logon to a Windows NT domain and provide the domain name. You can choose either one of the "Network logon options" depending on your desired logon action.

- 10) This completes the configuration of the network. Close the control panel by clicking the "OK" button. Windows 95 will ask for various parts of the original Windows 95 installation media while it adds the new software components. It is possible you will get messages about an attempt to install older version of existing component software. Always choose to keep the newer versions installed in these cases.
- 11) Once all new software is read from the original Windows 95 installation media (in step 10) you will be asked to restart. Select the "continue" option instead and run the SETNET program located on

the DOS Compatibility Installer disk. Select the NDIS and NetBEUI options and click the "OK" button. This step will create the appropriate entries in the PROTOCOL.INI file for the NDIS driver to use.

- 12) Restart the Windows 95 environment by clicking the "start" button, selecting the "restart" option, and choosing "shutdown and restart".

DOS Compatible Card: Configuring Windows 95 for TCP/IP (8/96)

Revised: 8/6/96
Security: Everyone

DOS Compatible Card: Configuring Windows 95 for TCP/IP (8/96)

=====

Article Created: 6 August 1996

TOPIC -----

This article describes configuring Windows 95 for TCP/IP for a DOS Compatibility Card.

DISCUSSION -----

Windows 95 can be easily configured to use the TCP/IP protocol. You must use the TCP/IP protocol stack that is part of the Windows 95 installer disk(s) to ensure compatibility with the Operating System and applications.

Windows 95 manages all network configuration in the Networks control panel, so we will begin our installation there.

- 1) Double-click the My Computer icon on the desktop. The Control Panel folder is located in the window that opens.
- 2) Double-click the Control Panel folder.
- 3) Locate the Network control panel and double-click it to open and begin the configuration.

You will typically find previous network protocols loaded. For this example, the client is using NetBEUI to connect to a Windows NT servers.

- 4) To begin the installation, click the Add... button.
- 5) In the screen that follows, choose Protocol and click the Add... button.
- 6) Choose Microsoft in the Manufacturers: window on the left, and the TCP/IP option in the Network Protocols: window on the right.

The computer will return to the Network control panel after the loading process with an additional entry for TCP/IP now showing.

- 7) Choose the new TCP/IP entry and click the Properties button. The resultant dialog box is where all TCP/IP configuration is performed. Configurations can be made for a DHCP address server, manual address, DNS gateways, WINS name services, and so on.

CAUTION: You MUST include the TCP/IP address and Broadcast mask at minimum. Most installations will require DNS entries as well.

- 8) Fill out all entries needed for this installation with information provided by the network administrator.

NOTE: If your installation requires DNS, you may find the DNS configuration screen a little confusing. You must put the name of your computer in the Host field and the domain you wish to be a part of in the Domain field. After these value are entered you must add the address of the DNS server(s) to the list and the domain names you wish to be a part of to the other list.

- 9) Click the OK button to end the TCP/IP configuration. If TCP/IP is the only protocol installed, go to step 10.

If TCP/IP is not the only protocol installed on the computer you must tell Windows 95 which protocol is the default to use when connecting to servers. To do this,

- i) Select the desired protocol item (our example uses NetBEUI as the default) and click the Properties... button.
- ii) Choose the Advanced tab and you will find a check box on the page to set this protocol as the default.
- iii) Click the OK button when you have checked the box.

This completes this configuration of the network.

- 10) Close the control panel by click the OK button. Windows 95 will ask for various parts of the original Windows 95 installation media while it adds the new software components. It is possible you will get messages about an attempt to install an older version of existing components. Always choose to keep the newer versions installed in these cases.
- 11) Once all new software is read from the original Windows 95 installation media (in step 10) you will be asked to restart. Select the "continue" option instead and run the SETNET program located on the DOS Compatibility Installer disk. Select the NDIS and TCP/IP options (plus any other protocols you have loaded) and click the "OK" button. This step will create the appropriate entries in the PROTOCOL.INI file for the NDIS driver to use.

12) Restart the Windows 95 environment by clicking the "start" button,
selecting the "restart" option, and choosing "shutdown and restart".

Power Macintosh Multiprocessor FAQ (12/96)

Revised: 12/17/96
Security: Everyone

Power Macintosh Multiprocessor FAQ (12/96)

Article Created: 5 August 1996
Article Reviewed/Updated: 17 December 1996

TOPIC -----

This article includes Frequently Asked Questions (FAQ) about multiprocessing on Power Macintosh computers.

Questions in this FAQ:
=====

- 1) What is Multiprocessing (MP)?
- 2) How is multiprocessing accomplished on Power Macintosh computers?
- 3) Is Apple's implementation of multiprocessing asymmetric or symmetric?
- 4) What are the supported configurations for using MP on Macintosh computers?
- 5) How does the performance on computer intensive tasks compare to uniprocessor systems?
- 6) Can you run applications that are not MP-savvy on an MP system?
- 7) Can third-party companies license the Apple Multiprocessor API software?
- 8) How can you verify that the Multiprocessor card and software APIs are working properly?

DISCUSSION -----

- 1) Question: What is Multiprocessing (MP)?

Answer: Multiprocessing computer systems are based on more than one microprocessor to provide a performance edge in demanding, computer-intensive

situations.

2) Question: How is multiprocessing accomplished on Power Macintosh computers?

Answer: The Power Macintosh 9500/180MP is Apple's first multiprocessing system. It consists of a dual PowerPC 180 MHz 604e processor card combined with the Apple/DayStar Multiprocessor API, an extension to System 7.5.x which enables multiprocessing. The hardware and API enable increased performance when used with a multiprocessing-savvy application.

From a hardware perspective, both of the processors can be active at the same time. The first processor handles the Mac OS and I/O tasks and sends the multiprocessing tasks to the second processor to implement.

The software implementation is an extension to System 7.5 that enables multiprocessing. It consists of a two-part shared library: a highly leveraged API library that applications interface to and a low level engine that the kernel code controls, interrupts, and tasks in the different processors.

3) Question: Is Apple's implementation of multiprocessing asymmetric or symmetric?

Answer: The current system software release (System 7.5.x) and multiprocessing card provide asymmetric multiprocessing. Asymmetric multiprocessing means that the main processor runs the Mac OS and I/O interrupts, and the other processor runs the multiprocessing tasks. Symmetric multiprocessing means that any processor can handle any type of tasks. Future system software releases may support symmetric multiprocessing.

4) Question: What are the supported configurations for using MP on Macintosh computers?

Answer:

Supported Computers

=====

Currently, the only configuration available from Apple is the Power Macintosh 9500/180 MP. However, third-party companies, such as DayStar Digital, may make a multiprocessing card that will work in one of the other PCI-based Power Macintosh computers.

Memory Requirements

=====

Based on the types of applications that are becoming MP-aware (such as graphics, 3D, web authoring), you will need a minimum of 32 MB and could easily expand over 100 MB to support all of your applications.

IMPORTANT TIPS

=====

Disable Virtual Memory

When using the multiprocessing capabilities, you cannot depend on software solutions to low-memory situations, such as virtual memory or RAM Doubler, because the multiprocessing software is not compatible with virtual memory. Because of this, if virtual memory is turned on or RAM Doubler is installed, then your multiprocessor-compatible software applications will not be able to take advantage of the second PowerPC processor.

This is particularly important because PowerPC applications typically require more memory when run with virtual memory turned off.

Turn off hard disk sleep

Make sure that the hard disk sleep interval is set to "Never" in the Energy Saver control panel. Otherwise, software applications designed to work with your multiprocessor Power Macintosh may not work properly.

5) Question: How does the performance on computer intensive tasks compare to uniprocessor systems?

Answer: We have seen performance in the range of 1.5-2 times faster on computer intensive tasks such as 3D rendering.

6) Question: Can you run applications that are not MP-savvy on an MP system?

Answer: Yes, the computer will run the application as a single processor system offering the performance of the single processor.

7) Question: Can third-party companies license the Apple Multiprocessor API software?

Answer: The Apple Multiprocessor API is part of the Software Licensing distribution program and is available to any developer.

8) Question: How can you verify that the Multiprocessor card and software APIs are working properly?

Apple includes an application called PowerFraxx on multiprocessing-capable computers, such as the Power Macintosh 9500/180MP. PowerFraxx is a benchmarking application that generates fractals from the classic Mandelbrot set. This application uses the multiprocessor card if the card and multiprocessor API software are installed properly.

To test that the card and software are installed and working properly, follow these steps:

Step 1

=====

Locate and run the PowerFraxx application.

PowerFraxx is pre-installed in the Apple Extras folder on the hard disk and can also be reinstalled from the CD Extras Folder on the System Software CD-ROM disc.

Step 2

=====

A

If the multi-processor card and software API are installed properly, a Multiprocessing menu option will be present.

Choose "Use 2 Processors" from this menu. This verifies that the card and software are properly installed. You do not need to follow any of the remaining steps.

B

If the Multiprocessing menu option is not available, either the multiprocessing software or card are not installed properly. Continue with Step 3 to troubleshoot.

Step 3

=====

Verify that virtual memory or Ram Doubler are turned off because the multiprocessing software is not compatible with virtual memory.

Step 4

=====

Verify that the multiprocessing API software is properly installed. Within the Extensions folder, there should be a folder called "Multiprocessing", which should contain two files:

- Apple Dual Processor HAL
- Multiprocessor API Library

If these files are not installed, reinstall the multiprocessing software. The Multiprocessing Software folder is located in the Apple Extras folder on the hard disk or in the System Software folder on the System Software CD-ROM disc.

PowerPC Platform FAQ (5/97)

Revised: 5/5/97
Security: Everyone

PowerPC Platform FAQ (5/97)

=====

Article Created: 5 August 1996
Article Reviewed/Updated: 5 May 1997

TOPIC -----

This article includes Frequently Asked Questions (FAQ) about the PowerPC Platform (formerly known as the Common Hardware Reference Platform or CHRP).

Questions in this FAQ:
=====

- 1) What is the PowerPC Platform (formerly known as the Common Hardware Reference Platform or CHRP)?
- 2) Will using a computer based on the PowerPC Platform allow me to use more than one OS?
- 3) When are PowerPC Platform-based computers going to be introduced?

DISCUSSION -----

1) Question: What is the PowerPC Platform (formerly known as the Common Hardware Reference Platform or CHRP)?

Answer: PowerPC Platform is an open computing architecture, based on the RISC PowerPC microprocessor, and able to run multiple operating systems.

2) Question: Will using a computer based on the PowerPC Platform allow me to use more than one OS?

Answer: Yes, a PowerPC Platform-based computer allows users to run the various operating systems by simply re-booting from one OS to another. In this case, the different operating systems are located on different hard drives.

Operating systems and applications that previously didn't run under PowerPC processors will need to be recompiled. No modification will need to be made to Mac OS applications.

3) Question: When are PowerPC Platform-based computers going to be introduced?

Answer: There are no announcements at this time. Apple will issue press releases when PowerPC Platform-based computers are introduced.

Macintosh Performa 6400: What is CMSCP Folder? (8/96)

Revised: 8/6/96
Security: Everyone

Macintosh Performa 6400: What is CMSCP Folder? (8/96)

=====

Article Created: 6 August 1996

TOPIC -----

In the System Folder of my Macintosh Performa 6400 series computer, there is a folder named CMSCP. Inside this folder are two folders that are called: "Kodak Color Management Files Used by Adobe Photoshop".

My computer does not appear to have Adobe Photoshop on it. Was it supposed to be included? If not, what is the purpose of this folder? Can I simply delete this folder?

DISCUSSION -----

The CMSCP folder contains color management files used by Adobe PhotoDeluxe in conjunction with the KODAK PRECISION color matching system. If you remove the folder, Adobe PhotoDeluxe will still run fine but the KODAK PRECISION color matching system will be useless.

The "Used by Adobe Photoshop" folder is an error and should say: "Used by Adobe PhotoDeluxe".

LaserWriter 12/640 PS: Cannot Insert 250 Sheet Cassette (8/96)

Revised: 8/6/96
Security: Everyone

LaserWriter 12/640 PS: Cannot Insert 250 Sheet Cassette (8/96)

=====

Article Created: 6 August 1996

TOPIC -----

I cannot insert the 250 sheet cassette in my LaserWriter 12/640 PS printer. What is wrong?

DISCUSSION -----

The problem may be the length guide on left side of the 250 sheet cassette has shifted backwards. This can occur if you load a full stack of paper and tilt the tray so the weight of paper forces the length guide backwards. Check that length guide is in proper position before insertion into the printer. There is an indent position for each paper length adjustment. When the length guide is between indent positions, the cassette cannot be inserted into the printer.

LaserWriter 12/640 PS: Paper Jam Light Remains On (8/96)

Revised: 8/6/96
Security: Everyone

LaserWriter 12/640 PS: Paper Jam Light Remains On (8/96)

=====

Article Created: 6 August 1996

TOPIC -----

I had a paper jam in my LaserWriter 12/640 PS printer, however, after clearing the jam by following instructions in the manual, the jam light remains on. What is wrong?

DISCUSSION -----

Check the following two places again because it is easy to miss jammed paper in these locations.

- Look carefully in the duplexer by removing the duplex tray and pivoting the vertical duplexer portion away, then look in the lower rear portion (removing the 250 cassette will also help in improving visibility).
- Remove the black diverter (it has two white clothes pin type clips on it) and look into the exit of the fuser region (WARNING: it may be hot in this region) for a potential accordion style paper jam. After removing the jammed paper from the fuser region, put the black diverter back into position with the two white clothes pin type clips.

DOS Compatibility Cards and Supported Protocols (8/96)

Revised: 8/7/96
Security: Everyone

DOS Compatibility Cards and Supported Protocols (8/96)

=====

Article Created: 7 August 1996

TOPIC -----

Which non-AppleTalk protocols, such as IP, IPX, and DECNet, work with the DOS Compatibility Card through the following network interfaces:

Built-in Ethernet
PCI Ethernet cards
PCI Token Ring cards
Communications Slot (Power Macintosh 5400) Ethernet cards

DISCUSSION -----

The DOS Compatibility cards do not support Token Ring in any form, and the software on the DOS Compatibility Installer disk can only use the built-in Ethernet Interface when one is present (Communication Slot Ethernet cards can be used on computers without built-in Ethernet interfaces), it also cannot use cards in the PCI slots for I/O.

Apple's software requires that any packet coming into a Macintosh be delivered to either the Macintosh, or DOS environments (packets cannot go to both at the same time) depending on the frame type of the received packet. These destinations are determined by each OS as they register their protocol and frame types within the Macintosh computer at startup. Once a particular frame type is registered all packets of that frame type addressed to the computer are delivered to the associated environment.

This element of our architecture has been responsible for the historical limitation of running TCP/IP only in one environment at a time. TCP/IP is practically implemented only with Ethernet_II frame types, since all packets of one frame type go to only one environment..

With the introduction of the Power Macintosh 7200/90 (in Europe ONLY), 7200/120, 7600/120, 8500/132, 8500/150, and 9500/150 a new Ethernet controller ASIC called Curio Prime is used. This chip implements two hardware Ethernet addresses for

the single built-in Ethernet interface. One is used by the Mac OS and the other is for DOS Compatible use only. Since these computers have two hardware addresses the DOS compatible architecture can now deliver a particular frame type to different addresses which removes the limitation of each frame type going to only one environment.

The presence of this Curio Prime ASIC is the biggest factor in determining a particular Macintosh computer's networking capability with DOS compatible cards.

AppleTalk, IPX, TCP/IP and DECNet can be used in either OS. They can all be used by both environments if the Curio Prime ASIC is present, except for the following:

- DECNet/DOS will not run on any Macintosh computers.
- DECNet will not run on a Power Macintosh 5400 Mac OS environment.
- IPX will not run on a Power Macintosh 5400 Mac OS environment, but will run on a Power Macintosh 5400 DOS environment.

DOS Compatibility Card: Config Novell 32-bit Client (8/96)

Revised: 8/7/96
Security: Everyone

DOS Compatibility Card: Config Novell 32-bit Client (8/96)

=====

Article Created: 7 August 1996

TOPIC -----

This article outlines the steps needed to configure Apple's DOS Compatibility Card to use Novell's 32-bit client software to attach to a NetWare server.

DISCUSSION -----

Step 1

Start Windows 95. Restart in MS-DOS mode.

Step 2

Run the NetWare 16-bit installer to install the ODI driver.

- a) At the install screen choose no for #3 (do not install Windows support).
- b) Choose #5, press enter and select OTHER DRIVERS.
- c) Eject the Novell installer floppy disk and insert the "PC Compatibility Installer" floppy disk and press Return.
- d) Choose the PC Compatibility Ethernet Adapter.
- e) Press return to select the frame type.
IMPORTANT: Press the F10 key to save your settings.
- f) Press enter to begin the installation. Insert disks as required
- g) When the installation is done, exit to DOS and type "EXIT" to restart Windows.

This completes the ODI driver installation.

Step 3

Verify that the ODI driver is working by performing the following:

- a) Restart Windows 95 and press F8 when you see the "Starting

Windows 95..." message on the screen.

b) Choose the "Step-by-Step Confirmation" option.

1) Answer "Y" to all questions. When you reach the
"C:\NWCLIENT\STARTNET" command you have reached the driver loading
section.

2) Answer "Y" to "NWLLANGUAGE".

3) Answer "Y" to "LSL.COM".

4) Answer "Y" to "MACODI.COM".

5) Answer "Y" to "IPXODI.COM".

If you have the right frame type selected you should get a message
that reads "You are attached to server...".

6) This completes the verification of the drivers. Answer "Y" to all
remaining questions until Windows 95 starts.

Step 4

Now install the 32-bit client from Windows 95.

a) Insert disk 1 of the 32-bit installer set and run the "setup" program,
click Start and choose the "Run..." option, then type "a:\setup" into
the dialog box that follows.

b) Close the license box by pressing the "y" key.

c) Click the setup program's Start button.

d) After files have been copied you will be presented with a "Select
Device" dialog box asking for the network driver to install. Choose the
"Existing ODI Driver" option and click OK.

e) You may be asked to provide some computer identification information.
See your network administrator for the required information, and type
it into the proper fields, then click Close.

f) You will be asked if you wish to set any special properties. Click NO,
there will be a chance later to provide any information we might want.

g) You will be asked to insert disks as files are copied to the hard
drive. You may also be asked for the original Windows 95 media.

h) When the installation is complete you will be asked to restart. Eject
the floppy and restart the computer.

The installation may not be complete at this point. To finish the installation
open and close the Network control panel in Windows 95.

Step 5

Open the Network control panel.

Step 6

Choose "IPX/SPX-compatible Protocol" and click Properties.

Step 7

Choose the Advanced tab.

Step 8

Choose "Frame Type" and enter the correct frame type on the right.

Step 9

Click OK to close the dialog box.

Step 10

Choose "IPX 32-bit protocol..." and click Properties.

Step 11

Choose the Advanced IPX tab.

Step 12

Select the "Primary Logical Board" check box and fill in the correct frame type.

Step 13

Click the "Use only the following frame types" radio button and select the frame type.

Step 14

Click OK to close the dialog box.

Step 15

Choose "Novell NetWare Client 32" and click Properties.

Step 16

The "Client 32" page should be visible. Enter a preferred tree or server name.

Step 17

Click OK to close the dialog box.

Step 18

Click OK in the Network control panel.

Step 19

You may be requested to provide various installation media. If you are asked for the Novell NetWare DOS driver disk insert the "PC Compatibility Installer" floppy disk. If you are asked for the location of "lsl.com" type "c:\nwclient".

Step 20

When you are asked to restart choose "continue" instead.

Step 21

Copy the "MACODI.COM" file from the c:\nwclient directory to c:\windows.

Step 22

Now restart the computer to complete the installation.

If your configuration is accurate you will be presented with a Novell Logon dialog box during the startup process. To confirm your connection you can open the "Network Neighborhood" icon and look for your Netware server and/or tree name.

Macintosh Performa 6400: System 7.5 v7.5.3 Compatibility (8/96)

Revised: 8/21/96
Security: Everyone

Macintosh Performa 6400: System 7.5 v7.5.3 Compatibility (8/96)

=====

Article Created: 7 August 1996
Article Reviewed/Updated: 21 August 1996

TOPIC -----

I just purchased a Macintosh Performa 6400 series computer, and I want to install System 7.5 Version 7.5.3 on it. However, whenever I attempt to start up from the System 7.5 Version 7.5.3 CD-ROM disc or Disk Tools disk, the computer will not start up. How can I install this system software on my computer?

DISCUSSION -----

The Macintosh Performa 6400/180 and 6400/200 computers currently ship with System 7.5 Revision 2.1. The development cycles of the Macintosh Performa 6400 series computer and System 7.5 Version 7.5.3 made it impossible for System 7.5 Version 7.5.3 to be supported on these Macintosh Performa computers.

However, Macintosh Performa 6400 series computers running System 7.5 Revision 2.1 have all the applicable system software fixes contained in System 7.5 Version 7.5.3. As such, at this time you would not benefit from installing System 7.5 Version 7.5.3.

Apple releases system software updates on a quarterly basis. The Macintosh Performa 6400 series computers will be included in a future system release if and when there are identified fixes for that computer.

Apple TV/FM Radio System: Which Video-in Card to Use? (8/96)

Revised: 8/8/96
Security: Everyone

Apple TV/FM Radio System: Which Video-in Card to Use? (8/96)

=====

Article Created: 8 August 1996
Article Reviewed/Updated: 9 August 1996

TOPIC -----

I want to install the Apple TV/FM Radio Tuner System (M4586LL/A) in my computer but I have an earlier version of the Apple Video System (video-input card). Do I need to upgrade to the latest Apple Video System, part number M2894LL/D?

DISCUSSION -----

The Apple TV/FM Radio Tuner System (M4586LL/A) was tested with all previous revisions of the Apple Video System and is backwards compatible with them.

Depending on your computer, you may need a new rear I/O Door which has the necessary access holes for both antennas. You need to ask an Apple-authorized service provider to order this for you. The Apple service part number for the rear I/O Door is 922-2190.

Color OneScanner 600/27: 60 DPI Software Limitation (8/96)

Revised: 8/8/96
Security: Everyone

Color OneScanner 600/27: 60 DPI Software Limitation (8/96)

=====

Article Created: 8 August 1996

TOPIC -----

The User's Guide for the Apple Color OneScanner 600/27 states that you can scan at 12 Dots Per Inch (DPI), however the Dispatcher software only gives the option of 60 or 75 DPI. How can I select 12 DPI?

DISCUSSION -----

The 12 DPI is the hardware limit of the scanner. The software lower limit, as you noticed, is 60 DPI. The Preview uses a 75 DPI scan and the thumbnails are interpolated in the software. The 12 DPI is not used with the Apple software. There may be other third-party software, such as plug-ins, that take advantage of the 12 DPI, but Apple is not aware of any.

Desktop Printing 2.0: Menu Visible but Isn't Functional (1/97)

=====

Article Created: 8 August 1996
Article Reviewed/Updated: 7 January 1997

TOPIC -----

After moving a desktop printer into a closed folder, the Printing menu stays active, yet none of the functions in the menu work. All of the options remain bold in the menu, yet if you select any of them, nothing happens. I then opened the folder that contains the desktop printer. The icon for the desktop printer is still highlighted. I tried selecting the options in the printing menu and they still would not do anything. I clicked on another icon in the folder the same folder. That icon became highlighted, but the desktop printer icon also remained highlighted as if the shift key were down. When I clicked on a third icon, it became highlighted and the other two went back to normal. At this time, I could click on the desktop printer and all of the functions in the printing menu worked as expected.

DISCUSSION -----

This has been reproduced and reported to the engineering team. The quick workaround as you outlined is to make certain that if a desktop printer (or printers) is placed into a folder, you must open that folder and select the desktop printer you want to use in order for the Printing menu to work correctly.

Apple Internet Connection Kit: How & What to Remove (11/96)

=====

Article Created: 8 August 1996
Article Reviewed/Updated: 5 November 1996

TOPIC -----

I used the Custom Remove feature of the Apple Internet Connection Kit (AICK) installer to remove AICK, however, it did not work. What files do I have to put into the Trash to remove AICK?

DISCUSSION -----

Here is what AICK installs that you will have to drag to the Trash.

Begin_Table

Internet Connection Kit Folder:

- Apple Internet Connection Kit Guide
- Apple Internet Dialer
- Internet Applications
 - Claris EMailer Lite
 - Fetch
 - NCSA Telnet
 - Netscape
 - NewsWatcher
- Internet Utilities
 - Apple Internet Status
 - Internet Config
 - MacPing
 - QuickTime/QTVR
 - RealAudio
 - Sparkle
 - Stuffit Expander
 - Config PPP Folder
 - Config PPP control panel *

Read Me

System Folder Items:

Control Panels:

Config PPP

~ATM

Extensions:

Internet Config Extension

MacTCP Token Ring Extension

ObjectSupportLib ***

PPP

Hosts

Preferences **

Internet Dialer Folder

Internet Dialer Prefs

Modem Information

reg server

Internet Prefs

End_Table

* Installed by the AICK installer in this location. Placed in control panels on first successful connection made by the Internet Dialer.

** The Preferences folder items, which could be used by other applications, may not need to be removed. This is especially true if you plan on reinstalling AICK.

*** This is a shared library file and may provide additional AppleScript support for other installed PowerPC applications. Removing it could result in an error dialog and the need to reinstall the application which needs this shared library.

Physical Layer Ethernet Errors (8/96)

Revised: 8/8/96
Security: Everyone

Physical Layer Ethernet Errors (8/96)

=====

Article Created: 8 August 1996

TOPIC -----

This article describes physical layer Ethernet errors and some of their common causes.

DISCUSSION -----

Integrity of the physical layer of an Ethernet network is required for upper layer protocols like TCP/IP and AppleTalk to function effectively. Errors at the physical layer generally result from faulty wiring, defective transceivers, network interface cards, or hub ports. Apple products adhere to industry standards for Ethernet and troubleshooting methods generic to the industry can be used to recognize physical layer issues.

Protocol analysis can be used to monitor physical layer health. While physical errors are a normal occurrence, they should not exceed two percent of available bandwidth as a general rule of thumb.

Common physical layer errors include collisions, cyclic redundancy check/alignment errors, and frame length errors.

Collisions

Collisions on an network are normal due to the collision detect (CSMA/CD) nature of the Ethernet access method. If no problems exist on the network, but there are slow file transfers, a minor collision rate from a workstation does not indicate a problem. Collisions above one percent of overall network traffic should be taken seriously and normally indicate either a faulty cable, transceiver, or network interface.

CRC/ Alignment Errors

Cyclic redundancy check (CRC)/ alignment errors generally indicate improper byte-alignment for Ethernet packets. CRC errors greater than two percent of

overall traffic require attention. Most commonly CRC errors can be isolated to a particular workstation with a faulty network interface card. Alternatively, a faulty transceiver, cable, or hub port can be responsible for CRC errors.

If CRC errors cannot be isolated to a unique workstation address, cabling is the likely cause. Faulty connectors, improper grounding of thin coax wiring, or defective wiring concentrators could be the root problem.

Frame Length Errors

Standard Ethernet packets vary in length from 64 to 1,518 bytes. Any packet with a length outside of the standard range constitutes an error. Packets shorter than 64 bytes are often referred to as "runts" or "short frames". "Long packets" exceed 1,518 bytes. Troubleshooting frame length errors can be troublesome since the packets generally do not contain reliable address fields. Fault isolation usually requires removal of physical devices until the symptom is removed, with the last device removed then labeled as suspect. The root cause of the errors could be a defective network interface, transceiver, or a corrupt network interface driver.

System 7.5.3: Out of Memory Error After Fax (8/96)

Article Created: 9 August 1996
Article Reviewed/Updated: 19 August 1996

TOPIC -----

I get out of memory errors after sending a fax on my Performa 6320. If I try to run any program after Faxing or during Faxing the out of memory error occurs. If I force quit the Finder after Faxing I do not get out of memory errors, but I do not think this is a solution because I again get out of memory errors the next time I send a fax. I tried to clean install software, but this did not resolve the issue. What is wrong, and what can I do to resolve this?

DISCUSSION -----

After testing we believe the issue results from an interaction between System 7.5 Update 2.0 (System 7.5.3) and the Global Fax software. If System 7.5 Update 2.0 or System 7.5.3 Revision 2 is installed, out of memory errors occurred after Faxing from the Finder, in other words choosing Fax Window from the File menu. Testing shows this issue on the following Macintosh computers: Apple Power Macintosh 5200/75 LC and 5300/100 LC, and Macintosh Performa 5200, 5215, 5300, 6200, 6205, 6214, 6216, 6218, 6220, 6230, 6290 and 6300 series.

As a workaround faxing from within an application seemed to work properly in all cases. For example, if you want to fax a window or desktop, take a picture of it (the Command-Shift-3 feature), and then from within Simple Text fax the picture. We tested Global Fax 2.5.4P with a TelePort Gold IIv modem, and Global Fax 2.5.5P and 2.5.6P with a TelePort Platinum V modem.

As you point out, a simple workaround is to force quit the Finder, and of course, restarting the computer would also work.

Global Village has also reproduced this issue. Apple and Global Village are now looking into it to determine the best method for a fixing. Because of the uncertainty of what the nature of this issue is, it is impossible to give a time frame for a fix, or how the fix will be distributed.

WorldScript Updater 1.1: Read Me (8/96)

Revised: 8/9/96
Security: Everyone

WorldScript Updater 1.1: Read Me (8/96)

=====

Article Created: 9 August 1996

TOPIC -----

This article contains the ReadMe file for the WorldScript Update v1.1.

DISCUSSION -----

Who Should Install WorldScript?

=====

This installer will install files needed by WorldScript technology for users running Mac OS 7.5 and above. Users of the Japanese and Chinese Language Kits or applications which depend on WorldScript technology should install these pieces as they improve the stability and performance of your system.

QuickDraw GX and Power Macintosh users should upgrade to these pieces as they provide important improvements over previous versions.

The files in this WorldScript updater are taken from the Arabic Language Kit 1.0.1, Hebrew Language Kit 1.0.1 and the Cyrillic Language Kit 1.0. You do not need this if you are running one of these kits and do not simultaneously have Japanese or Chinese installed.

Using the WorldScript Updater

=====

The Easy Install option of the WorldScript Updater 1.1 updates your existing WorldScript and/or Language Kit Extension files. If you want to install additional files, you can use the Custom Install option of the Installer. The Language Kit Extension will only be available as an update. In other words, you cannot install this unless you have purchased an Apple Language Kit and have it installed in your active system.

1. To open the WorldScript Updater, double-click the Installer icon on the disk you received with your WorldScript Updater package.

2. To update existing WorldScript and Language Kit Extension files on your startup hard disk, click Install.

To install additional files, choose Custom Install from the pop-up menu, then click to put an X in the box next to each item you want to install. When you're finished choosing items, click Install.

The files are installed on your hard disk. You may be prompted to restart your computer after installation.

About the WorldScript Updater

=====

The WorldScript Installer installs the following files:

- * WorldScript I (version 7.5.3) used for complex one-byte processing of languages such as Arabic and Hebrew,
- * WorldScript II (version 7.5.1) used for two-byte processing of languages such as Chinese, Japanese, and Korean,
- * InputBackSupport (version 7.5.3) provides support for two-byte fonts; automatically installed with WorldScript II,
- * Language Kit Extension (version 7.5.2) provides essential support for all Language Kit products. This extension cannot be custom installed. It will be automatically installed on all systems where it is necessary.

What's new the WorldScript Updater 1.1 over WorldScript Updater 1.0.1?

=====

1. It updates the Language Kit Extension to 7.5.2 when it is present and not otherwise. In previous versions of the WorldScript Updaters, the Language Kit Extension was left untouched.
2. WorldScript I is version 7.5.3. Improvements since 7.5.1 include fixing a conflict with ATM, fixing a crash with LC 475, Performa 57x, and Duo 280c CPUs, allowing Setting control panels (Arabic, Hebrew, Persian) to work better as secondary scripts and some minor improvements to WorldScript I script resources.
3. The WorldScript Updater 1.1 installer script recognizes name differences by doing a more intelligent search and thus will now work with localized file names.
4. It recognizes the difference between WorldScript Power Adapter and WorldScript II which at one point had the same type and creator.
5. It prevents installation of the Language Kit Extension on systems where it does not already exist.
6. It updates InputBackSupport even when WorldScript II doesn't need to be updated.

7. Naming is now more consistent. "WorldScript Pieces", "WorldScript Pieces Installer", "WorldScript Updater", "WorldScript Installer", 7.5.1, 1.0, have all been changed so that it is consistently called "WorldScript Updater 1.1."

Clean System Install on an PCI-based Workgroup Server (8/96)

Revised: 8/13/96
Security: Everyone

Clean System Install on an PCI-based Workgroup Server (8/96)

Article Created: 9 August 1996
Article Reviewed/Updated: 13 August 1996

TOPIC -----

This article describes how to do a clean system install of the Mac OS on an AppleShare server and preserve privileges. This procedure will work on Workgroup Server and other Macintosh computers.

NOTE: This will not cure problems due to corrupted Users & Groups Data File or AppleShare PDS file.

This is the procedure to use if your system software on a Mac OS AppleShare server has become damaged, and you want to replace it while preserving privileges and sharing information.

DISCUSSION -----

First, Restart with either a Disk Tools floppy, or the Workgroup Server CD-ROM and run Disk First Aid and allow any fixes. If Disk First Aid cannot repair the drive, you should back up your data, format the drive, and then restore the data.

WARNING: Be sure to back up data BEFORE formatting a drive because all data will be lost during the formatting process.

If your problem was starting the file server software itself, or in any way involved with privileges, you will want to attempt to compact volume access privileges with the AppleShare Admin software prior to resorting to the clean install. This will frequently fix privilege problems. If the server still will not start, follow these steps:

Clean Server Install

Step 1

Startup with the "Workgroup Server Software" CD-ROM disc that came with your Workgroup Server by pressing and holding the "c" key after restarting until you see the "Welcome To Macintosh" screen.

At the desktop, the "Workgroup Server Software" CD disc's icon should be in the upper-right corner of your screen with your hard drive's icon below it. If another hard drives appear above the "Workgroup Server Software" CD, open the Startup Disk control panel, and select the "Workgroup Server Software" CD. Close all open windows and restart the computer. The "Workgroup Server Software" CD should now appear in the upper-right corner above the hard disk.

Step 2

Open the "Install System Software" folder and double click on "Install System Software."

Step 3

When the "Welcome to System 7.5" message appears, click Continue.

Step 4

When the installer window appears, press the Command-Shift-K keys simultaneously (the Command key is the key with the Apple and Clover leaf). You will be presented with a small dialog box with two selections:

- Update Existing System Folder
- Install New System Folder

For a clean install, select Install New System Folder and click "OK." Make sure the Destination Disk on the bottom left is the hard disk you want to install onto, then click Clean Install on the bottom right. This will install a new system folder and rename you current folder "Previous System Folder."

Step 5

After the system software has been installed, restart and install AppleShare Software.

NOTE: Be careful not to launch AppleShare until you are instructed to do so.

Step 6

After the computer has restarted, open the System Folder, and the Preferences folder. Drag the Users & Groups Data File to the trash. Close the Preferences folder.

Step 7

Locate the folder named Previous System Folder and open it, then open the Preferences folder. While pressing and holding the Option key on your keyboard, drag the Users & Groups Data File to the desktop. (Holding down the option key will let you copy the Users & Groups Data File instead of moving it.) Close the Preferences folder and the Previous System Folder.

Step 8

The System Folder should still be open (if it's not, open it). Drag the Users & Groups Data File on the desktop to the Preferences folder of the open System Folder.

Step 9

Restart the computer and open the Sharing Setup control panel. Enter the Macintosh name, it does not have to be the same name as it was before, but if possible, it should be the same to keep from confusing users. Then choose AppleShare Admin in the Apple menu. (You may be prompted for server name and admin key.) Verify that users & groups are intact. If they are, now run the AppleShare File Server program.

NOTE: This methodology will preserve the original System Folder's hierarchy in the Previous System Folder. At this point you can transfer any items from your Previous System Folder to your new one if necessary. BE CAREFUL NOT TO REPLACE ANY EXISTING ITEMS. Those items which were either installed during the install process, or are unnecessary may be placed in the Trash.

PC Compatibility Cards: Errors Installing Video Software (8/96)

Revised: 8/26/96
Security: Everyone

PC Compatibility Cards: Errors Installing Video Software (8/96)

Article Created: 12 August 1996
Article Reviewed/Updated: 26 August 1996

TOPIC -----

If I follow the Quick Setup instructions on pages 174-175 in the PC Compatibility Card User's manual (either 7-inch or 12-inch), I get an error message that says, "Can't open file E:\VIDEO\DRIVER\EEDATA.EE_".

When I try to install using the "Factory Default" settings I get a different error message.

What do these messages mean? How can I work around them?

DISCUSSION -----

=====
Can't Open File Error Message
=====

Issue
=====

When you get the error message that says, "Can't open file E:\VIDEO\DRIVER\EEDATA.EE_", the installer is trying to create a file on the CD-ROM disc which it cannot do. Also, the installer will modify AUTOEXEC.BAT so it will try to load E:\VIDEO\DRIVER\CUSTOM, which will generate one of several error messages each time the computer is started:

1. Invalid drive specification - if CUSTOM loads before MSCDEX
2. Bad command or file name - if CUSTOM loads after MSCDEX and some CD-ROM disc other than PC Utilities is in the drive
3. CDR101: Not ready reading drive E - if there is no CD-ROM disc in the drive

Workaround

=====

The workaround is as follows:

Step 1

Run E:\VIDEO\DRIVER\INSTALL and go through the Utilities Installation to install the files into C:\MACH64.

Step 2

Switch to C:\MACH64, run INSTALL, and do the Quick Setup. As long as you do not select the factory default setting it creates EEDATA.EE_ in the C:\MACH64 directory.

=====

Error Installing "Factory Default"

=====

Issue

=====

If you use Quick Setup to configure DOS video and choose the "Factory Default" selection, the installer will not create the EEDATA.EE_ file. However, CUSTOM.COM is still loaded in AUTOEXEC.BAT, and on every restart you get an error which says, "Problem opening file "EEDATA.EE_". CUSTOM is not installed."

Resolution

=====

The way to resolve this issue is to:

Step 1

Remove the CUSTOM line in AUTOEXEC.BAT

Step 2

Select a different monitor in Quick Setup, then go back and select 'Factory Default'.

Color StyleWriter 2500: Read Me Document (8/96)

Revised: 8/12/96
Security: Everyone

Color StyleWriter 2500: Read Me Document (8/96)

=====

Article Created: 12 August 1996

TOPIC -----

This article contains the Color StyleWriter 250 Readme document.

DISCUSSION -----

Information About Your Color StyleWriter 2500 Printer

This document contains important reminders and some information that's not in the user manual.

Contents

- Installation Alert
- Apple Color Printing CD
- Low-memory Troubleshooting
- Color Printing
- Other Printing Tips
- Desktop Printing
- Watermarks
- Printing With QuickDraw GX
- Using the Color StyleWriter 2500 With Application Programs

Installation Alert

Because of data compression, it may take installer Disk 1 up to 12 minutes to install its contents onto your hard disk. The other disks will work much more quickly.

Apple Color Printing CD

If you have problems with the software on the Apple Color Printing CD, contact

the appropriate manufacturer:

- for Personal Publishing Toolkit, contact GDT, 604-473-3678
- for StickerShop Plus!, CardShop Plus! or Calendars and More, contact Mindscape, 415-898-5157
- for help with the fonts, contact Bitstream, 617-497-7514

Low-Memory Troubleshooting

If you notice any of these symptoms, your Macintosh may be running out of memory.

- The Macintosh displays "out of memory" warning messages.
- Some portions of a document don't print.
- Printing is very slow.

To make more memory available, try these suggestions:

- Have only one program open at a time.
- Increase the amount of memory you give to the program you're printing from by using the Get Info command (as explained in the documentation that came with your Macintosh).
- Use the Chooser to turn off background printing, as explained in Chapter 2 of the user manual.
- Choose Normal in the Print dialog box.
- In the Page Setup dialog box, choose Portrait (normal) orientation instead of Landscape (sideways) orientation.
- Remove any watermarks from your document.
- Desktop printing requires more memory to print than PrintMonitor 7.1.2. You can remove desktop printing by using the custom remove option called "Desktop Printing Software."
- When you print in the background, if you often get a message that there is not enough memory to print on a certain desktop printer, you can give that desktop printer more memory by selecting its icon and choosing the Get Info command. Then increase the number in the Preferred Size box. (For more information on increasing a program's memory, see the documentation that came with your Macintosh.)
- Use the Memory control panel to turn on virtual memory, as explained in the documentation that came with your Macintosh.

Color Printing

- When printing very light colors in grayscale mode, you may see thin lines fade

or break up. If this happens, pick a darker color for the affected object, or try printing with the Pattern halftoning option selected. (In the Print dialog box, click the Color button, then select the Pattern option.)

- If you print a document that should have a smooth gradient from one color or shade to another and notice an unexpected color change, it may be that one of the colors in the gradient cannot be reproduced by the printer. Try using a different matching method in the Color Options dialog box, or try turning off ColorSync.
- If the color blue on your printout appears purple, turn on ColorSync in the Color dialog box.
- In some programs, colors on the screen may look solid but contain tiny black dots when printed. To print solid blocks of color without these black dots, use the Business Graphics color-matching method. In the Print dialog box, click the Color button. In the Color Options dialog box that appears, make sure there is an X in the ColorSync box, and then select Business Graphics from the Matching Method pop-up menu.

If your colors still have too many black dots, create the document in a program that allows you to define each color, then make the color fully saturated. For example, to print yellow without any black dots in it, use your application program to define the yellow you are using as 100% red, 100% green, and 0% blue.

Other Printing Tips

- If you see random fine lines within a landscape printout, change the orientation to portrait if possible.
- If you see very thin stripes near the bottom of your printout, use your application program to make your bottom margin larger. A bottom margin of 0.8 inches or greater is best.
- For best results when printing envelopes, do not put images or text along the bottom edge of the envelope.
- If you get the message, "Serial port in use by another application, please quit the application and try again," restart your Macintosh before trying to print again.
- Close the Chooser after making any changes to it.
- To avoid confusion when sharing your printer, be sure to give each shared Color StyleWriter 2500 printer a unique name. If you have more than one printer with the same name in a single AppleTalk zone, the Chooser will display only one of them.

Desktop Printing

- If no desktop printer icons appear after you follow the instructions in Chapter 1, it may mean the Installer program installed PrintMonitor 7.1.2 instead of the desktop printing software. This can happen if you are running system software version 7.5 or earlier in a language other than English. You have three choices:

- Use the PrintMonitor 7.1.2 that was installed.
- Upgrade to System 7.5.1, and then install the Color StyleWriter 2500 software again.
- Use the Installer program's Custom Install feature to install the desktop printing software. This option, however, also installs an English-language version of the Finder.

- When you choose Save or Open in your application programs, you will see your desktop printers listed as if they were folders, but you should not save or open any documents in them. If you do, you will not be able to access your documents.

- If you want to have more than 3 desktop printers, you must increase the Desktop PrintMonitor memory allocation by 10K for each additional desktop printer you want. To do so, select the Desktop PrintMonitor icon—it's in the Extensions folder inside the System Folder—choose Get Info, type a larger number in the Preferred Size box, then close the Get Info window.

Watermarks

- When using a watermark, make sure the font that is in the watermark file is also in the Fonts folder inside your System Folder. If you give the watermark file to someone, they also need any fonts that it uses in order to use the watermark in their own documents.

- If you are printing a diagonal watermark such as Draft or Final on A4 or Legal size paper, for best results use Centered or Align Top Left orientations.

Printing With QuickDraw GX

- If you have QuickDraw GX on your system, the Color StyleWriter 2500 Installer will automatically install everything you need for printing with QuickDraw GX. If you have the Color StyleWriter 2400 GX driver in your Extensions folder, remove it and restart the computer before using the Color StyleWriter 2500 GX driver.

- If you installed QuickDraw GX after you set up your Color StyleWriter 2500, you must reinstall the Color StyleWriter 2500 software.

- After you click the Print button to print a complex document, you may notice a delay before you see printer activity.

- If printing with QuickDraw GX doesn't produce satisfactory results, you can use the GX Helper utility to turn off QuickDraw GX and use the regular QuickDraw

printing software. For more information, see Appendix E of your user manual.

Using the Color StyleWriter 2500 With Application Programs

If you have problems printing from a specific program, it may be a problem in that program. If you have problems, contact the publisher of the program. In some cases a newer, more compatible version of the software may be available.

- In some programs—such as Microsoft Word 5.1, WordPerfect 3.5 and ClarisWorks 4.0—rotated text created within the program may print with jagged edges. For best results, create the rotated text in another program and paste it in.

Notes About Specific Programs

The following list describes some special situations that you should be aware of when working with specific programs. (There may be other problems with these programs or with other programs not mentioned in this document.)

Adobe Type Manager

- When you install version 3.8.1 or later of Adobe Type Manager, some system fonts are removed from your system and placed in a folder called "De-installed Fonts1." If you later turn off ATM, drag all the fonts in the "De-installed Fonts1" folder back into the Fonts folder inside the System Folder to prevent characters with jagged edges.
- If you get incorrect output when you try to print rotated and flipped Adobe Type 1 fonts, try using a TrueType font instead.

Adobe Illustrator 5.0

- Unless you have at least 15–20 MB of free disk space on your startup disk, you will see a "disk is full" error message when you try to print. The more complex the document, the more space you need.

Adobe Persuasion 3.0

- If you are having difficulty canceling printing from Persuasion, try turning off ATM.

Adobe PageMaker 5.0

- To see the Color StyleWriter 2500 Page Setup and Print dialog boxes, click the Setup button in PageMaker's Print dialog box.
- When printing rotated PICT or EPS images, be sure background printing is turned on in the Chooser. If you must print in the foreground, rotate the image in another program, then import it into PageMaker in the orientation in which you plan to print it.
- PageMaker 5.0 prints pages in reverse order on the Color StyleWriter 2500, which may be particularly confusing if you are using 2-up or 4-up printing. To

print the first page first, turn on the Reverse Order option in the Print dialog box.

- Try changing the monitor depth from thousands or millions to 256 if you are having difficulty printing a particular document.

CardShop Plus! 1.0, Calendars and More 1.0, StickerShop Plus! 1.0

- If you are using QuickDraw GX, do not use GX Helper with these applications.

ClarisDraw 1.0v2

- If you have problems printing in the background, you may want to increase the Desktop PrintMonitor extension's preferred size to 300K (by using the Get Info command, as explained in the instructions that came with your Macintosh). The extension is located in the Extensions folder inside your System Folder.

Common Ground MiniViewer 1.1.3

- For best results print in Normal mode.

DeltaGraph Pro 3.0.4

- When printing charts, always click the QuickDraw button in the Print dialog box.

FrameMaker 5.0

- If you import text as a graphic, you can crop it on the screen but it will print uncropped.
- Rotated text in large point sizes will print as a gray box. For best results, break up the text blocks into smaller pieces or individual characters.
- For best results, use TrueType fonts when printing rotated text.
- Do not mix portrait and landscape pages in the same document.

MacDraw II 1.1 v2

- To print in color, be sure to turn on the Print Color Patterns in the Print Options dialog box and select Color in the Image pop-up menu in the Print dialog box.
- If you experience problems when printing your MacDraw II document with layout of 2-Up or 4-Up, try using a different program, like ClarisDraw.

Microsoft Excel 4.0 and Lotus 1-2-3

- To print in color, be sure to check the Print Using Color option in the Print dialog box and select Color in the Image pop-up menu.

Microsoft Excel 5.0

- If colored cell borders drop out when printing, try using yellow or brown or you can use the line tool in the Drawing tools palatte.
- When you choose the Page Setup command, you get Excel's own version of the Page Setup dialog box. Click the Options button to see the version of the dialog box with the special Color StyleWriter 2500 options.

Microsoft Word 6.0

- When you cancel a print request from Microsoft Word 6.0, part of the document will still print. If you are using desktop printing, try stopping the print queue on your desktop printer and then removing the print request instead of canceling. To do this, click your desktop printer icon and select Stop Print Queue from the Printing menu.
- For best results when printing envelopes, choose Envelopes and Labels from the Tools menu. Then click the Feed icon. In the Envelope Options dialog box that appears, click the second icon from the left, and make sure that Face Up is selected.

ModelShop II 1.2

- For best results, print in Normal mode.

Ofoto 2.0.2

- For best results, make a custom calibration for the Color StyleWriter 2500 and click the Custom Profile button.

Print Shop Deluxe 1.1.1

- If you are getting off-center and incomplete printouts of cards, try restarting your Mac.

QuickMail 3.5 and earlier versions

- If you are getting rectangles instead of characters in your QuickMail printout, try selecting Text Only in the Print Dialog box.

Studio/8 v 2.0 and Studio/32 v 1.2

- Always click the QuickDraw button in the Print dialog box.

Newton Press 1.0: ReadME First File (8/96)

=====

Article Created: 12 August 1996

TOPIC -----

This article contains the Newton Press 1.0 Read Me First file.

DISCUSSION -----

About Newton Press 1.0

Congratulations on purchasing Newton Press. The Newton Press application enables you to quickly and easily transfer information from your desktop computer to your Newton personal digital assistant (PDA). Newton Press provides a fast, convenient means of producing electronic documents that anyone with a Newton PDA can read.

This Read Me contains important late-breaking information about using the Newton Press application on computers running the MacOS. This document presents information about:

- Installing Newton Press
- Obtaining a serial cable or LocalTalk connector box
- Using Newton Press Guide
- Setting up Newton Press
- Increasing the amount of memory available to Newton Press
- Using sample Newton books and templates
- Formatting a document before adding it to a Newton book
- Using translators
- Adding a spreadsheet to a Newton book
- Troubleshooting

If you have access to the World Wide Web, you can provide feedback and obtain the latest information about Newton Press and other Newton products from:

<http://newton.info.apple.com/newton/>

Installing Newton Press

Follow the instructions for installing the application provided in Chapter 1, "Getting Started" in the Newton Press User's Guide. Be sure to turn off any virus-detection software and system extensions before installing the software, as explained in the instructions. If you experience problems installing, see the Newton Press User's Guide in Chapter 9, "Troubleshooting," or the troubleshooting section at the end of this document.

Obtaining a serial cable or LocalTalk connector box

You can connect a Newton PDA directly to your computer using a serial cable, or you can connect it to your AppleTalk network using a LocalTalk connection box. If you already have a serial cable that you use to connect your Newton PDA and computer, you can continue to use that cable.

If you do not have a cable or adapter, you can purchase one from your local dealer or from Apple. Call 1-800-211-1537 (US and Canadian customers only) or contact your dealer for more information. In Australia, call Apple Software Upgrades at 1-800-631-125 or send a fax to 02-452-8204.

Using Newton Press Guide

To easily familiarize yourself with Newton Press, be sure to use the Newton Press Guide. The Newton Press Guide provides on-line help that can answer most common questions about the application.

With Newton Press running, press Command-Shift-? or choose Newton Press Guide from the Help menu. The Newton Press Guide lists topics you can choose. These topics provide step-by-step instructions for completing many Newton Press tasks.

Setting up Newton Press

Before you can install a Newton book created on your computer to a Newton PDA, you must set preferences that indicate how you have connected your Newton PDA to your computer. You can not transfer information to the Newton PDA unless you indicate how the computer and Newton PDA are connected.

- If you are using a LocalTalk connection, choose Preferences from the Edit menu and select Connect via Network.
- If you are using a serial cable connected to your computer's printer or modem port, choose Preferences from the Edit menu, choose Connect via Serial, and choose the port to which you have connected your serial cable.

These connection instructions are included in the installation procedure in the Newton Press User's Guide in Chapter 1, "Getting Started."

Increasing the amount of memory available to Newton Press

The Newton Press application is preset to create documents up to 500K in size. If you need to create larger documents, you can increase the amount of memory allocated to the application.

1. Choose Quit from the File menu to close Newton Press, if it is open.
2. In the Finder, click the Newton Press application icon.
3. Choose Get Info from the File menu. The Get Info window appears.
4. Type a larger number in the "Preferred size" box.
5. Click the close box to close the window.
6. Double-click the Newton Press icon to open the application.

Using sample Newton books and templates

When you install the Newton Press software, you'll find a Samples folder on your desktop. This folder contains samples of Newton books for you to try.

Stationary documents for several word processors are also provided for you to use as templates. These templates are documents formatted to approximate the margins of Newton Press books. You can open a template and then add and format information before adding it to Newton Press. This allows you to take advantage of the word-processing application's advanced features for editing, formatting, spell-checking, etc.

Note: Some template formatting does not match the format of a Newton book exactly because of the unique text handling characteristics used by Newton PDAs. These templates do not provide a good formatting guideline when you use a header in your Newton book.

You can erase the sample Newton books and template files from your hard disk when you no longer want them.

Formatting a document before adding it to Newton Press

Sometimes it is easier to format a document in the application that originally created it, before adding it to a Newton book. For example, you may want to change tables or graphics to suit the size of a Newton PDA screen. Although Newton PDAs may have screens of differing sizes, most screens are approximately 3.25 inches high by 2.75 inches wide. Try setting up your documents to fit within these dimensions.

Using translators

When you add documents to Newton Press, Newton Press uses XTND translators to read different file formats. The Newton Press software includes translators to read the following file formats:

- ASCII
- Claris XTND Bridge

- EPSF
- MacPaint 2.0 Deluxe
- MacWrite 5.0
- MacWrite II
- Microsoft Word 4-5
- Microsoft Word 6.0
- Microsoft Works 2.0
- PICT
- RTF
- Text
- TIFF
- WordPerfect 3.1
- WriteNow 2.0

The translators are in the Claris folder in the System Folder. Other translators are available from Claris or third parties.

At the time of this release, there is no translator for ClarisWorks. To import a ClarisWorks file, use ClarisWorks to save the document in a file format that Newton Press can read.

If you do not have a translator for a specific file format, you will see an error message when you try to add the file to Newton Press or when you drag and drop a file on Newton Press to create a book automatically. If you see an error message, check the original application to see whether you can save your document in a file format that Newton Press can read.

Newton Press can read Microsoft Word files that have an OLE component only if you have the OLE extension installed on your computer. The OLE extension is automatically installed by the latest version of Microsoft Word.

If a particular translator does not seem to be translating information correctly, try saving your document in a different file format.

Adding a spreadsheet to a Newton book

You cannot add spreadsheets directly to Newton Press. However, you can add spreadsheet information in either of two ways:

- Convert the spreadsheet to a tab-delimited text format that Newton Press can read. Converting a spreadsheet this way works best for small spreadsheets that do not have more than several columns of information.
- Convert the spreadsheet to a picture and import the picture into Newton Press. For example, capture an image of the spreadsheet using a screen-capture application, or transfer the spreadsheet into a graphics application and save it as a graphic. Converting a spreadsheet into a graphic enables you to add images of larger spreadsheets to Newton Press which can then be scrolled on a Newton PDA screen. However, this graphic method of conversion may create large files.

Tip: If you use Microsoft Excel, you can use a shortcut to copy spreadsheet information as a picture. Select the information you want in your spreadsheet,

then hold down Shift as you open the Edit menu. Choose Copy Picture from the Edit menu. A picture of your information is placed on the Clipboard, and you can then paste it into Newton Press.

Troubleshooting

When I try to use the Redo command under the Edit menu, it is always grayed out.

- This feature has not been implemented in this version of Newton Press.

When I try to install Newton Press, the installer reports a disk error and refuses to proceed.

- You may have a damaged file on your hard disk that the installer can not overwrite. Choose the Custom Install option and install each component separately. This will help you to isolate the damaged file. Change the file name to a different file name and install Newton Press again.

I have connected my cable to the printer port and selected my printer port as my connection type in Preferences, but I can't install packages on my Newton PDA.

- If you select the printer port for a serial connection in your Newton Press preferences, you cannot use LocalTalk and must turn it off in the Chooser by making AppleTalk inactive. Note that this does not apply if you are using EtherTalk for your network.

I copied a graphic to my Clipboard, but I do not see it.

- If you open the Clipboard window and copy a graphic, the graphic may not immediately appear on the Clipboard. To see the graphic, close the window and reopen it. The graphic will appear.

When I switch computers and use Newton Press, the drag and drop features seem to work differently.

- Different versions of the MacOS support the drag and drop feature differently. You can drag and drop one or more files directly onto the application icon using any version of the MacOS. On computers running MacOS version 7.5 or later, you can also drag and drop files onto the open Newton Press window. With versions of the MacOS before 7.5, you cannot drag and drop files onto the Newton Press window.

On computers with MacOS version 7.5 or later, you can drag and drop text or graphic images onto your desktop from desk accessories or applications like the Scrapbook or Notepad. Such files are called clippings. You cannot add clippings to Newton Press by dragging and dropping them on the Newton Press icon or Newton Press window.

I have a Newton PDA that has the Newton Operating System 1.x, and my package icons don't look like packages on my computer desktop.

- Your packages appear as generic documents, instead of package icons. The appearance of your package icons makes no difference in the way Newton Press works. You can perform all Newton Press functions.

I added pictures to my Newton Press document, but they don't appear when I view the book on my Newton PDA.

- If there is not enough system memory available in your Newton PDA, large pictures may not appear in your Newton book. You may need to reduce the size of the picture for it to appear on all Newton PDAs.

I'm running both Newton Press and Newton Backup Utility and I can't install packages from Newton Press.

- While Newton Backup Utility is running, Newton Press will not be able to install packages. Quit Newton Backup Utility or use it to install your package.

I clicked STOP while a file was being added but the file was added anyway.

- There may be times when clicking on the STOP button does not stop the file from being added. This may happen either at the very beginning of the add or at the very end.

When I try to add a border around a group of text, multiple borders appear around the selected text.

- This may happen when editing around a graphic on a page. To fix this, select all the text and turn the border off. Join the text into one paragraph, turn a border on for the paragraph and then break up the individual lines.

My graphic is inverted but I can't turn it back to normal. Also, the graphic isn't inverted when it gets to my Newton PDA.

- Newton PDAs cannot currently display inverted graphics. It is possible to invert a graphic in Newton Press by selecting some text and a graphic and choosing "Invert" from the menu. Selecting a graphic by itself will not enable the invert function. Likewise, selecting an inverted graphic by itself will not allow you to disable the invert function. To turn the graphic back, you must select some text in front of the graphic along with the graphic, invert the text and graphic and repeat the process one more time.

When I tap the overview button on my Newton PDA, it freezes and I have to reset my Newton.

- It is possible to make a Table of Content entry that is a second level entry without a first level entry. The way to do this is to make the second entry a sub-topic and then delete the text associated with the first topic. A book with this type of Table of Contents will not function properly on a Newton PDA with Newton 2.0 OS. The way to fix this is to make the first entry a level-1 topic before you create the book.

Clean System Install: Workgroup Server 6150, 8150, 9150 (8/96)

Revised: 8/13/96
Security: Everyone

Clean System Install: Workgroup Server 6150, 8150, 9150 (8/96)

Article Created: 12 August 1996
Article Reviewed/Updated: 13 August 1996

TOPIC -----

This article describes how to do a clean system install of the Mac OS on an AppleShare server and preserve privileges. This procedure will work on Workgroup Server and other Macintosh computers.

NOTE: This will not cure problems due to corrupted Users & Groups Data File or AppleShare PDS file.

This is the procedure to use if your system software on a Mac OS AppleShare server has become damaged, and you want to replace it while preserving privileges and sharing information.

DISCUSSION -----

First, Restart with either a Disk Tools floppy, or the Workgroup Server CD-ROM and run Disk First Aid and allow any fixes. If Disk First Aid cannot repair the drive, you should back up your data, format the drive, and then restore the data.

WARNING: Be sure to back up data BEFORE formatting a drive because all data will be lost during the formatting process.

If your problem was starting the file server software itself, or in any way involved with privileges, you will want to attempt to compact volume access privileges with the AppleShare Admin software prior to resorting to the clean install. This will frequently fix privilege problems. If the server still will not start, follow these steps:

Clean Server Install

Step 1

Startup with the "Workgroup Server Software" CD-ROM disc that came with your Workgroup Server by pressing and holding the "c" key after restarting until seeing the "Welcome To Macintosh" screen.

At the desktop, the "Workgroup Server Software" CD disc's icon should be in the upper-right corner of your screen with your hard drive's icon below it. If another hard drives appear above the "Workgroup Server Software" CD, open the Startup Disk control panel, and select the "Workgroup Server Software" CD. Close all open windows and restart the computer. The "Workgroup Server Software" CD should now appear in the upper-right corner above the hard disk.

Step 2

Open the "System Software Installers" folder and double click on "System 7.5.1 Installer."

Step 3

When the "Welcome to System 7.5" message appears, click Continue.

Step 4

When the installer window appears, press the Command-Shift-K keys simultaneously (the Command key is the key with the Apple and Clover leaf). You will be presented with a small dialog box with two selections:

- Update Existing System Folder
- Install New System Folder

For a clean install, select Install New System Folder and click "OK." Make sure the Destination Disk on the bottom left is the disk you want to install onto, then click Clean Install on the bottom right. This will install a new system folder and rename you current folder "Previous System Folder."

Step 5

After the system software has been installed, restart and install AppleShare Software.

NOTE: Be careful not to launch AppleShare until you are instructed to do so.

Step 6

After the computer has restarted, open the System Folder, and the Preferences folder. Drag the Users & Groups Data File to the trash. Close the Preferences folder.

Step 7

Locate the folder named Previous System Folder and open it, then open the Preferences folder. While pressing and holding the Option key on your keyboard, drag the Users & Groups Data File to the desktop. (Holding down the option key will let you copy the Users & Groups Data File instead of moving it.) Close the Preferences folder and the Previous System Folder.

Step 8

The System Folder should still be open (if it's not, open it). Drag the Users & Groups Data File on the desktop to the Preferences folder of the open System Folder.

Step 9

Restart the computer and open the Sharing Setup control panel. Enter the Macintosh name, it does not have to be the same name it was before, but if possible, it should be the same to keep from confusing users. Then choose AppleShare Admin in the Apple menu. (You may be prompted for server name and admin key.) Verify that users & groups are intact. If they are, now run the AppleShare File Server program.

NOTE: This methodology will preserve the original System Folder's hierarchy in the Previous System Folder. At this point you can transfer any items from your Previous System Folder to your new one if necessary. BE CAREFUL NOT TO REPLACE ANY EXISTING ITEMS. Those items which were either installed during the install process, or are unnecessary may be placed in the Trash.

AppleVision 1710 Display: Using Two Displays Together (1/97)

Revised: 2/3/97
Security: Everyone

AppleVision 1710 Display: Using Two Displays Together (1/97)

=====

Article Created: 12 August 1996
Article Reviewed/Updated: 31 January 1997

TOPIC -----

I have two AppleVision 1710AV displays and want to use them on my Power Macintosh 9500 computer. Is this supported? If so, how can I get this configuration to work?

DISCUSSION -----

Yes, connecting two AppleVision 1710 Displays is a supported configuration. Connect the two displays (in Series) with an ADB Cable and they both show up as AppleVision Displays.

Note:

In this article there are references to the AppleVision 1710AV Display. However, this article also includes the AppleVision 1710 Display.

When you open the AppleVision Setup control panel, a dialog window appears on AppleVision Display #1. This is the display designated through the Monitors control panel as the startup display.

You are also able to adjust the bit depth and resolutions for both displays separately through the control strip at the bottom of the display. The displays appears as two separate sections with the name of the display, AppleVision 1710/AV Display 1 and AppleVision 1710/AV Display 2, at the top of these sections.

If two AppleVision 1710AV Displays are used you will only have microphone and speaker capabilities through one of these displays by connecting the sound and microphone connections to your Macintosh computer. There may be third-party solutions allowing you to connect two connections to both ports on the back of the computer.

When the calibrate message appears, it appears on the display that is being

recalibrated. This message appears every two weeks unless you change it in the AppleVision Setup control panel.

The only problems that may be encountered with using this display, or any Multiple Scan Display, with a NuBus or PCI video card would be that some video cards may only support one resolution; 640x480.

Article Change History:

31 Jan 1997 - Added note about AppleVision 1710 Display.

PC Compatibility Card: Configuring SoundBlaster in DOS (8/96)

Revised: 8/13/96
Security: Everyone

PC Compatibility Card: Configuring SoundBlaster in DOS (8/96)

=====

Article Created: 13 August 1996

TOPIC -----

I'm trying to install the DOS SoundBlaster driver that came on the PC Utilities CD of my PC Compatibility Card, but I can't find any setup files.

DISCUSSION -----

The Sound directory on the Utilities CD has two setup files:

- W31SETUP.BAT
- W95SETUP.BAT

These setup files infer that a version of Windows is required. The manual does not explicitly explain why there is no DOS Setup.

The DOS driver can be installed and configured by running the W31SETUP.BAT from the DOS prompt. This setup file may also attempt to install some Windows files. If Windows is not installed, the Windows applications can be bypassed by performing a custom installation.

Performa 6400: ANSI C++ PPC Lib and MWRuntimeLib Files (8/96)

=====

Article Created: 13 August 1996

TOPIC -----

On my Performa 6400 in the Extensions folder are two files, "ANSI C++ PPC Lib" and "MWRunTime.lib", neither of which have version, or copyright information. These files are also on the Macintosh Performa CD. I have not been able to locate these files on any other Macintosh computer, so I assume they are specific to the Performa 6400.

Which applications require these files?

DISCUSSION -----

The "ANSI C++ PPC Lib" and "MWRuntimeLib" are required Shared Libraries for the Apple Telecom and MegaPhone applications.

Open Transport 1.1.1b6 Read Me (8/96)

Revised: 8/13/96
Security: Everyone

Open Transport 1.1.1b6 Read Me (8/96)

=====

Article Created: 13 August 1996

TOPIC -----

This article is the Open Transport 1.1.1b6 ReadMe file.

DISCUSSION -----

Name: Open Transport
Version: 1.1.1b6
Released: August 5, 1996

Description: Unsupported beta release of Open Transport 1.1.1. For complete information, please see the Read Me included with this software.

Begin_Table

OT 1.1.1b6 consists of 4 disks:

Name as Posted	Actual Disk Name
OT 1.1.1b6-01of4.sea	Install 1
OT 1.1.1b6-02of4.sea	Install 2
OT 1.1.1b6-03of4.sea	Install 3
OT 1.1.1b6-04of4.sea	Install 4

End_Table

This software is available in two formats (disk images and "Net Install"):

1) Four self-extracting archives of Disk Copy 1440K disk images. To use, download, double-click the downloaded file (this decompresses it), and use Disk Copy to create the disks. Disk Copy can be found in the Utilities folder posted here.

2) A complete OT 1.1.1b6 "Net Install". It includes all software from all four

..TIL20283-Open_Transport_1-1-1b6_Read_Me_8-96_(TA35891).pdf

OT 1.1.1b6 disk images plus the contents of OT 1.1.1b6-Extras.sea. This posting is provided as a convenience for those customers who:

- want to download just one file.
- want a pre-configured "Net Install" to place on their hard drive or on a server.

PLEASE NOTE:

You do not need to download the "Net Install" if you have already downloaded the four separate disk images of OT 1.1.1b6.

Taken from the Read Me included with this software:

Introduction

You can use this pre-release version of Open Transport 1.1.1 to preview its features, enhancements, and updates. Pre-release versions of Open Transport 1.1.1 have been tested by progressively larger audiences and are now being used by hundreds of customers and Mac OS developers.

License agreement

This release of Open Transport is subject to the terms and conditions of the license agreement that accompanies the software in the file "LICENSE." By downloading the software you agree to abide by the terms and conditions of the license agreement.

Warnings and information about beta software

Open Transport 1.1.1b6 is "beta software"; it is not the finished version of Open Transport 1.1.1.

This software is being provided for test purposes and does not come with Apple technical support. Do not call Apple technical support or the Apple Assistance Center with questions, comments, or problem reports about Open Transport 1.1.1b6.

Open Transport 1.1.1b6 is provided on an as-is basis. It is not warranted to be complete or free from errors. Open Transport 1.1.1b6 may cause problems with your Mac OS computer and with other software you have installed. These problems may require you to reinstall the Mac OS System Software from your original floppy disks or CD-ROM disc.

If you want to provide Apple with feedback about Open Transport 1.1.1b6, send electronic mail to the following address: OTBeta@seeding.apple.com. Apple does not guarantee any response to messages you send, and does not provide technical support for Open Transport 1.1.1b6 through this or any other medium.

System requirements

Open Transport is designed to work on Mac OS-compatible computers with a Motorola 68030 or 68040 family microprocessor, or a PowerPC 601, 603(e), or 604 microprocessor. You should use system software version 7.5.3 with Open Transport, although the earlier system software versions 7.1, 7.1.1 and 7.1.2 releases are also compatible.

Open Transport 1.1.1b6 can be used on the Performa and Power Macintosh 52xx, 53xx, 62xx and 63xx product lines. When you install OT1.1.1 on a 52xx, 53xx, 62xx and 63xx machine you may get a dialog box indicating a hardware issue was detected. If this alert is displayed, Open Transport cannot be installed or loaded until the Cache/ROM DIMM is replaced. Your machine will continue to run classic networking. The required repairs are covered under the Apple repair extension program. Please contact an Apple Service Provider to have your machine repaired.

Open Transport requires a minimum of 5 MB of RAM (68030 or 68040 computers) or 8 MB of RAM (PowerPC-based computers). Open Transport memory requirements are based on total system memory including virtual memory, minus the size of any RAM disk and disk cache you're using.

Network interface options

Open Transport 1.1.1b6 supports PCI bus, NuBus, communications slot, and PC Card network interface cards, as well as built-in LocalTalk, Ethernet, and Token Ring network adapters. For computers without expansion options, Open Transport 1.1.1b6 also supports a SCSI-attached network adapter. Third party network interface options available for Open Transport include Fast Ethernet, ATM, and FDDI.

Network Server: Apple's Version of AppleTalk Running? (8/96)

Revised: 8/14/96
Security: Everyone

Network Server: Apple's Version of AppleTalk Running? (8/96)

=====

Article Created: 14 August 1996

TOPIC -----

I have a Network Server 500 and Network Server 700, how can I determine if Apple's version of AppleTalk is running?

DISCUSSION -----

To determine whether the Apple's AppleTalk stack is running, at the AIX command prompt, type the following command:

```
# atconfig -q
```

If the message "The AppleTalk stack does not appear to be loaded" appears, then Apple's AppleTalk stack is not running, or the Helios' stack is running instead.

Another way to determine if Apple's version of AppleTalk is running, is use the 'ps -ef' command to list the processes that are running. Look for either the process named 'appletalk', or 'router'. If neither is present then the Apple's AppleTalk stack is not running.

Open Transport/PPP 1.0f1c6: Internet Beta Seed Read Me (8/96)

Revised: 8/14/96
Security: Everyone

Open Transport/PPP 1.0f1c6: Internet Beta Seed Read Me (8/96)

=====

Article Created: 14 August 1996

TOPIC -----

This article is the Open Transport/PPP 1.0f1c6, the first Internet Beta Seed ReadMe file.

DISCUSSION -----

OT PPP 1.0f1c6 consists of 4 disks:

Name as Posted	Actual Disk Name
OT PPP 1.0f1c6-disk 1of3.sea	OT PPP Install 1.image
OT PPP 1.0f1c6-disk 2of3.sea	OT PPP Install 2.image
OT PPP 1.0f1c6-disk 3of3.sea	OT PPP Install 3.image

This software is available in two formats (disk images and "Net Install"):

1) Three self-extracting archives of Disk Copy 1440K disk images. To use, download, double-click the downloaded file (this decompresses it), and use Disk Copy to create the disks. Disk Copy can be found in the Utilities folder posted here.

2) A complete OT PPP 1.0f1c6 "Net Install." It includes all software from all three OT PPP 1.0f1c6 disk images plus the contents of OT PPP 1.0f1c6-Extras.sea. This posting is provided as a convenience for those customers who:

- Want to download just one file.
- Want a pre-configured "Net Install" to place on their hard drive or on a server.

PLEASE NOTE:

You do not need to download the "Net Install" if you have already downloaded the

three separate disk images of OT PPP 1.0f1c6.

Taken from the Read Me included with this software:

Open Transport/PPP 1.0f1c6
first Internet Beta Seed
Read Me

Introduction

This is the first public beta release of Open Transport/PPP. You can use this pre-release version of Open Transport/PPP preview its features.

License Agreement

This release of Open Transport/PPP is subject to the terms and conditions of the License Agreement that accompanies the software in the file "LICENSE." By using the software you agree to abide by the terms and conditions of the License Agreement.

Warnings and information about beta software

Open Transport/PPP 1.0f1c6 is "beta software"; it is not the finished version of Open Transport/PPP.

This software is being provided for test purposes and does not come with Apple technical support. Do not call Apple technical support or the Apple Assistance Center with questions, comments, or problem reports about Open Transport/PPP 1.0f1c6.

Open Transport/PPP 1.0f1c6 is provided on an as-is basis. It is not warranted to be complete or free from errors. Open Transport/PPP 1.0f1c6 may cause problems with your Mac OS computer and with other software you have installed. These problems may require you to reinstall the Mac OS System Software from your original floppy disks or CD-ROM disc.

If you want to provide Apple with feedback or report bugs about Open Transport/PPP 1.0f1c6, send electronic mail to the following address: ppp-beta@seeding.apple.com. Apple does not guarantee any response to messages you send, and does not provide technical support for Open Transport/PPP 1.0f1c6 through this or any other medium.

If you are part of a formal Apple seeding program please continue to send your feedback and bugs through your existing Apple contacts.

System requirements

Open Transport/PPP is designed to work on Mac OS-compatible computers with a

Motorola 68030 or 68040 family microprocessor, or a PowerPC 601, 603(e), or 604 microprocessor. You should use system software version 7.5.3 updated with Open Transport 1.1.1b6c3 or later, although the earlier system software versions 7.1, 7.1.1 and 7.1.2 releases are also compatible.

Before you install Open Transport 1.1.1b6

- Make backup copies of the software and documents on your hard disk (especially your System Folder) before installing this software.
- Your computer must be running Open Transport 1.1.1 b6c3 or later and system software version 7.1, 7.1.1, 7.1.2 or 7.5.3 before you can install OT/PPP 1.0f1c3.
- If you already use SLIP or PPP software to access the Internet, note down the configuration parameters that you entered into your previous SLIP or PPP software. Configurations are not automatically converted from 3rd party SLIP or PPP software.

How to turn off or remove Open Transport/PPP

Removing Open Transport /PPP with the Installer

You can remove Open Transport/PPP software with the Custom Remove option in the Installer.

To remove Open Transport/PPP using the Installer, follow these steps:

- 1) Open the Installer application included with Open Transport/PPP 1.0f1c6. The "Welcome to the Apple Installer" screen appears.
- 2) Click the Continue button.
- 3) This is the "Open Transport PPP Installation" window. Choose "Custom Remove" from the pop-up menu in the upper-left corner.
- 4) In the list that appears, select the files you would like to remove. This is done by clicking the box next to each file so that an 'X' appears in it. To completely remove OT/PPP you should select all the files listed.
- 5) Click the "Remove" button. If a window appears asking you whether to quit any open applications, click Continue. A window will appear telling you to restart your computer.
- 6) Click the "Restart" button.
- 7) Re-install and configure your previous SLIP/PPP software as required.

Tips for reporting OT/PPP beta problems

An OT Bug Report Template is included. Should you discover problems, please complete the template and forward it via electronic mail to OTBeta@seeding.apple.com.

Major Changes Since 1.0f1c2

- Improved performance of the OT/PPP serial link. You must have Open Transport 1.1.1b6c3 or later installed to see the speed increases.
- A verbose logging mode has been added. To enable it for a connection, put the PPP control panel into Admin mode. This can be done with the User Mode item in the Edit menu. Verbose logging will occur only while you're in this mode. Look for further improvements to the log in future releases.
- Many improvements were made to the Open Transport Apple Guide for OT/PPP.
- Improved connection behavior when selected serial port is in use by another application.
- A number of redialing bugs have been fixed.
- Improved the behavior of the activity indicators in the PPP control panel. The indicators reflect all PPP packet activity, including network and control packets.
- Improved keystroke handling and connect script recording the PPP terminal window.
- Fixed incompatibilities with CyberFinder and StuffIt Deluxe 4.0 which resulted in crashes at system startup time.
- Fixed incompatibility with Conflict Catcher 3.0.4.
- Fixed a problem with script for US Robotics modems.
- Fixed connect script recording for TIA (or SLIRP) accounts.

Known Incompatibilities and Limitations

-
- This release requires Open Transport 1.1.1b5c2 or later. You should not use it with Open Transport 1.1.
 - ARA 2.x modem CCL scripts may be used with OT/PPP; however, some 2.x scripts do not support modem-based error correction and data compression, so the performance may not be optimal. You should try to use one of the modem scripts provided with OT/PPP. If you can't find one that matches your modem, you may modify an existing script to suit your needs.
 - If you are using both ARA 2.1 and OT/PPP, be sure to install OT/PPP after ARA 2.1 to get the correct set of modem scripts for both products.
 - If you have a copy of Open Transport/PPP older than 1.0f1c2 installed, you must discard your old OT/PPP preferences files. To do so, throw away the folder "Remote Access" within the active Preferences folder. After deleting the old preferences, restart your computer and then use the Modem & PPP control panels to customize your configuration.
 - OT/PPP version 1.0 f1c6 has some incompatibilities with the Apple Express

Modem. If the "Internal Modem" choice does not appear in the Modem control panel port pop-up menu, uncheck the "Use internal modem instead of Modem/Printer port" checkbox in the Express Modem control panel. Also, make sure to disconnect OT/PPP connections using the Express Modem before shutting down or restarting your computer.

- You may experience some difficulty with older programs that do not use Open Transport and try to use the serial port while PPP is active. The workaround is to disconnect PPP using the PPP control panel before starting up the serial application.
- A problem in the Quit command of Claris EMailer sometimes causes a crash with Open Transport 1.1.1 (with or without OT/PPP). This problem is being investigated.
- OT/PPP is currently incompatible with PortShare Pro 2.6.
- OT/PPP may unexpectedly drop a connection when the remote server is busy and doesn't reply to echo requests within 10 seconds. This timeout interval will be lengthened in the next version of OT/PPP.

Interactions with 3rd party software

- NetScape 2.x will not work reliably with pre-7.5.3 Mac OS or pre-1.1 Open Transport software. If you would like to use NetScape 2.0.1, you should make sure that System 7.5.3 and OT 1.1 are also used. Failure to follow this recommendation may result in system crashes.

Energy Saver: Causes CD-ROM Discs To Stop Playing (8/96)

=====

Article Created: 14 August 1996

TOPIC -----

When I play an audio CD-ROM disc on my Power Macintosh 9500 computer, they play for a while then stop. Then the AppleCD Audio Player resets to track 1, time 0:00. Why?

DISCUSSION -----

This is being caused by the Energy Saver control panel and will be fixed in a future system update.

Note:
This affects all PCI-based Power Macintosh computers, not just the Power Macintosh 9500 computer.

Workaround
=====

Step 1

Open the Energy Saver control panel.

Step 2

Deselect "Shutdown instead of Sleep".

Step 3

Close the Energy Saver control panel.

LaserWriter 12/640 PS: Communication Switch Settings (8/96)

Article Created: 14 August 1996

TOPIC -----

This article contains the settings for the communication switch on the back of the LaserWriter 12/640 PS printer.

DISCUSSION -----

The following table shows the default communication settings.

Normal (in) Switch Position
=====

Begin_Table

PORT	Network PROTOCOL	MODE	DEFAULT
LocalTalk	LocalTalk	PostScript	PostScript
Ethernet	EtherTalk	PostScript,off	PostScript
	NetWare	PostScript,PCL5, Auto,off	Auto
	TCP/IP	PostScript,PCL5, Auto,off	Auto
Parallel	TBCP	PostScript,PCL5, Auto,off	Auto
	Normal	PostScript, Off	PostScript
	Raw	PostScript, PCL5, Auto,Off	Auto

+=====+

End_Table

Reset (out) Switch Position
=====

Begin_Table

+=====+			
PORT	Network PROTOCOL	MODE	
+=====+			
LocalTalk	LocalTalk	PostScript	
+-----+			
Ethernet	EtherTalk	PostScript	
	+-----+		
	NetWare	Auto Select	
	+-----+		
	TCP/IP	Auto Select	
+-----+			
Parallel	Parallel	Auto Select	
+=====+			

End_Table

Note:

When the communication switch is set in the Reset position, a startup page is printed each time the printer is turned on and the Extended Job Status settings are removed.

Installing DOS Compatibility 1.5 Software Update (8/96)

Revised: 8/14/96
Security: Everyone

Installing DOS Compatibility 1.5 Software Update (8/96)

=====

Article Created: 14 August 1996

TOPIC -----

This article covers how to install the DOS Compatibility 1.5 software update. There are several steps to installing your DOS Compatibility 1.5 software update:

- installing the Macintosh software
- installing support software for DOS
- installing support software for Windows (only if you are using Windows)

DISCUSSION -----

Before you install

Before you install the DOS Compatibility Software Update, check the version of your system software by opening the Apple menu and choosing About This Macintosh while the Finder is active. You can use either System 7.1.2 or System 7.5.3 with the DOS Compatibility Software Update.

If you are currently using System 7.5, you can install the System 7.5 Update 2.0 to update to System 7.5.3. You can order System 7.5 Update 2.0 on a CD or a high-density floppy disk set from the Apple Order Center.

Creating installation disks from disk images

Before you can install the DOS Compatibility Software Update, you need to use the Disk Copy program to create two installation disks from two disk image files. You will use these disks in the following sections to install the DOS Compatibility Software Update.

Follow the following steps to create the installation disks:

- 1) Obtain two blank, high-density floppy disks.
- 2) Double-click the APPLE_PC.image disk image file to open it in the Disk

Copy program.

- 3) Click the Make a Copy button, and insert one of your floppy disks. The Disk Copy program will create a DOS disk named APPLE_PC, and eject the disk.
- 4) Click the Quit button in the Disk Copy window.
- 5) Double-click the PC Compatibility Software.image disk image file to open it in the Disk Copy program.
- 6) Click the Make a Copy button, and insert the other floppy disk. The Disk Copy program will create a Macintosh disk named PC Compatibility Software and eject the disk.
- 7) Click the Quit button in the Disk Copy window. You have now created the disks you will need to install the DOS Compatibility Software Update.

Installing the Macintosh DOS Compatibility software

To install the Macintosh DOS Compatibility software, follow these steps:

- 1) Insert the PC Compatibility Software disk into the disk drive.
- 2) Double-click the Installer icon. A message may appear describing the Installer software. Click OK. The Installer window appears.
- 3) Make sure the disk named in the box is the one on which you want to install software. If not, click Switch Disk until the correct disk name appears.
NOTE: If you want to install only specific components, choose Custom Install from the Easy Install menu. In the Custom Install window, click to place an X in the boxes next to the components you want to install. Click the information symbol for more information about a component.
- 4) Click Install. The software is automatically installed onto your hard disk.
- 5) When the installation is complete, follow the instructions on the screen to quit the Installer and restart your Macintosh. The following Mac OS software is now installed:

Name	Location
-----	-----
Macintosh Easy Open	Control Panels folder
PC Exchange	Control Panels folder
PC Setup	Control Panels folder
Apple CD-ROM	Extensions folder
Ethernet (built-in)	Extensions folder
PC Compatibility Guide	Extensions folder
PC Clipboard	Extensions folder
PC Clipboard Translators	Extensions folder
PC Net Exchange	Extensions folder
PC Network Extension	Extensions folder
PC Print Spooler	Extensions folder

Installing support software for DOS

Installing the software on the APPLE_PC floppy disk updates the DOS Compatibility software in the PC environment. If you are using Windows, follow the steps in the next section, "Installing Support Software for Windows."

To install the software, follow these steps:

- 1) In the PC environment, insert the APPLE_PC floppy disk. To switch to the PC environment from the Mac OS, press Cmd-Return, or open the PC Setup control panel and click Switch to PC.
- 2) Type A:\SETUP; then press Return.
- 3) You may see a message asking if you want to install support for DOS or Windows. Press D for DOS.
- 4) You're asked to choose a drive for the files. Choose the C drive.
- 5) You're asked to choose a directory. It's best to accept the suggested directory, C:\APPLE.
- 6) Choose Yes to continue installation. If you're asked whether you want to overwrite files, choose Yes.
- 7) You're asked whether you want the program to modify your system files. Choose "Apply changes directly to system files." If you choose to apply the changes to copies of the system files, the copies are called filename.number.
- 8) When installation is complete, restart the PC by switching to the Mac OS (by pressing Cmd-Return), opening the PC Setup control panel, and clicking Restart PC. You can also restart the PC by pressing the Control-Alt-del keys.

Installing support software for Windows

Installing the software on the APPLE_PC floppy disk updates the DOS Compatibility software in the PC environment. If you are using DOS, follow the steps in the previous section, "Installing Support Software for DOS."

To install the software, follow these steps:

- 1) If necessary, switch to the PC environment. To switch to the PC environment from the Mac OS, press Cmd-Return, or open the PC Setup control panel and click Switch to PC.
- 2) Insert the APPLE_PC floppy disk.
- 3) In Windows, choose Run from the File menu. In Windows 95, click Start; then choose Run from the menu that appears.
- 4) Type A:\SETUP; then press Return.
- 5) Follow the instructions that appear on the screen. The recommended directory to install files is C:\APPLE. To change this location, click Set Location. By default, all options will be installed. You may choose not to install specific options. The installation options are:
 - Install Macintosh/Windows Copy and Paste: allows you to transfer Clipboard information between the Macintosh and PC environments.
 - Install Macintosh/PC Folder Sharing: allows you to share a Macintosh folder as a shared drive.
 - Install CD-ROM Support: allows you to use the CD-ROM discs in the PC environment.
- 6) When installation is complete, shut down Windows or Windows 95. To shut down Windows, choose Exit Windows from the File menu in the Program Manager. To shut down Windows 95, click the Start button and choose Shut Down from the menu that appears.
- 7) Press Cmd-Return to switch to the Mac OS environment.
- 8) Open the PC Setup control panel and click Restart PC.

IMPORTANT: If you are using Windows 95, refer to the "DOS Compatibility Software Update" User's Manual for "Sound Problems" in Chapter 4, "Troubleshooting in the PC Environment." This section contains important information about configuring Sound Blaster so that it works properly with Windows 95.

Newton Internet Enabler: Requires Modem Connection (8/96)

Revised: 8/15/96
Security: Everyone

Newton Internet Enabler: Requires Modem Connection (8/96)

=====

Article Created: 15 August 1996

TOPIC -----

I want to connect my Apple MessagePad 130 to an AppleTalk network, so I can use the Internet. Is this possible?

DISCUSSION -----

The current version of Newton Internet Enabler (NIE) does not support TCP/IP over an AppleTalk network. You must use NIE in conjunction with an Internet Service Provider (ISP) to actually connect and use the Internet.

The software required after connecting to an ISP is dependent upon what Internet services you want to access. To browse the World Wide Web, a WEB browser such as NetHopper is required. Other services such as network mail offer more software choices such as GoFetch, Eudora for Newton, Mail on the Run!, LunaMail, EnRoute.

No additional information on when TCP/IP over AppleTalk will be enabled in the Newton Operating System is currently available.

Note:

The Newton Internet Enabler works with any Apple MessagePad 120 or Apple MessagePad 130 with at least 2Mb of RAM and the Newton 2.0 OS.

QuickTake 150: Image Quality Differences (8/96)

Revised: 8/15/96
Security: Everyone

QuickTake 150: Image Quality Differences (8/96)

=====

Article Created: 15 August 1996

TOPIC -----

The QuickTake 150 high quality and standard quality pictures are both listed as 640x480 pixels. If they are both the same size what is the difference between the high quality and standard quality pictures?

DISCUSSION -----

Unlike the QuickTake 100, which had two different resolutions, the QuickTake 150 uses the same resolution for both high and standard resolution images. The difference is in the compression ratio.

Compression Ratios
=====

High resolution images: 1.5 bits per pixel
Standard resolution images: .75 bits per pixel

Open Transport 1.1 and Intranet Access Issue (8/96)

Revised: 8/19/96
Security: Everyone

Open Transport 1.1 and Intranet Access Issue (8/96)

=====

Article Created: 19 August 1996

TOPIC -----

I am using an 10Base-T Ethernet C1 Router connected to a T1 line. I have setup a Power Macintosh using Open Transport on the same network as classic network based Macintosh computers. The Open Transport-based computer is able to connect to outside sites on the Internet using Netscape, but this computer is unable to get internal sites on our Intranet. Netscape returns an error something like, the server does not have a DNS Entry, when trying to access an intranet web site. The MacTCP based computers do not have a problem with either intranet, or Internet addresses. What is wrong?

DISCUSSION -----

A possible solution is to check to see if you have selected 802.3 Framing in the TCP/IP control panel. With the TCP/IP control panel open, choose User Mode in the Edit menu. If the checkbox next to "Use 802.3" is selected, deselect it by removing the "X".

It is very rare for 802.3 style addressing to be used for the Ethernet frame type. The Use 802.3 option should only be selected for a 802.3 CSMA/CD Access Method and Physical Layer Specification. IEEE 802.3, 802.4, and 802.5 define different network topologies and media access methods, or the ability of a node to physically send and receive data on a LAN.

Macintosh Performa 6400: Monitors & Sound Control Panels? (8/96)

Revised: 8/19/96
Security: Everyone

Macintosh Performa 6400: Monitors & Sound Control Panels? (8/96)

=====

Article Created: 19 August 1996

TOPIC -----

On page 7 of the Megaphone for Performa User Guide, the instructions state to "...double click the Sound control panel..." However, I cannot find the Monitors or Sound control panels on my Macintosh Performa 6400/180 computer. I have attempted to restore the system software using the Macintosh Performa CD, but I still do not have these control panels.

DISCUSSION -----

Your computer does not have separate Sound or Monitors control panels because the functionality of these two control panels has been integrated into one control panel: Monitors & Sounds. Use the Monitors & Sounds control panel to adjust the video or sound settings on your computer. For assistance using this control panel, refer to the Sound and Monitors topics of Macintosh Guide, available in the Guide menu.

External CD-ROM Drive: No Sound From Audio CD's (8/96)

Revised: 8/19/96
Security: Everyone

External CD-ROM Drive: No Sound From Audio CD's (8/96)

=====

Article Created: 19 August 1996

TOPIC -----

I have an external CD-ROM drive and when I play audio CD-ROM discs I get no sound. Sound from data CD-ROM discs work fine.

DISCUSSION -----

With any external CD-ROM drive (like the Apple CD 600e, 300e, 150) you have to attach external speakers or headphones to the RCA jacks on the back or the headphone jack on the front of the drive to get sound from an audio CD-ROM disc.

There is no path for audio CD data to be transmitted over the SCSI chain. With an internal CD-ROM drive for example, there is an actual separate physical audio connection from the CD-ROM drive to the Macintosh logic board. Data CD sound is actually synthesized by the computer itself and as such needs no audio connection.

LaserWriter 12/640 PS: Erroneous Out Of Paper Message (8/96)

Revised: 8/20/96
Security: Everyone

LaserWriter 12/640 PS: Erroneous Out Of Paper Message (8/96)

=====

Article Created: 20 August 1996

TOPIC -----

I have a LaserWriter 12/640 PS printer and every time I try to print a message indicates it's out of paper, however, there is paper in the paper cassette. If I put paper in the multipurpose tray, the printer prints from there, even though I selected AutoSelect in the print dialog box. Also my test page is coming out with part of the image clipped off when I turn on the printer.

DISCUSSION -----

The LaserWriter 12/640 PS printer includes a universal cassette which lets you place a variety of paper sizes in the printer by adjusting the cassette for the paper size used. In order to adjust the cassette, the user must extend or retract the length guide on the left side of the tray to meet up with the top of the paper. When adjusted properly this guide will click into place by a marking on the tray that specifically indicates the paper size.

There is some confusion because the 8 1/2 x 11 length guide setting is not completely at the back of the cassette. In fact, when the length guide is at the back of the cassette, the cassette is actually set for A4 paper. This is probably why your test page is clipped and print jobs are being sent to the multipurpose tray instead of the cassette. Move the length guide, located on the rear left side of the cassette, one notch to meet the top of the 8 1/2 x 11 paper.

When choosing AutoSelect in the print dialog box, the Macintosh will check the printer to see what paper sizes are installed and compare it to what is selected in page setup. If the printer senses A4 size paper in the cassette, the printer will look for 8 1/2 x 11 paper in the multipurpose tray to print with. If there is nothing in the multipurpose tray, you will get an out of paper message.

Power Macintosh 7500: Cache Issue (11/96)

Revised: 2/17/97
Security: Everyone

Power Macintosh 7500: Cache Issue (11/96)

=====

Article Created: 20 August 1996
Article Reviewed/Updated: 12 November 1996

TOPIC -----

I have a Power Macintosh 7500/100 computer, and I recently installed an L2 Cache DIMM into it. However, now the computer will not start up. What could be causing this?

DISCUSSION -----

Apple has become aware of an issue affecting some (but not all) customers who install the Power Macintosh 256K L2 Cache DIMM (M3808LL/A or 661-1035)* in their Power Macintosh 7500 computers. Some customers report that their computer will not start up as long as the Cache DIMM is installed. Other customers have also reported similar symptoms when using third-party cache DIMMs.

Apple has determined that a limited number of Power Macintosh 256K L2 cache DIMMs sold by Apple may not be compatible when installed into a Power Macintosh 7500/100 computer. To resolve this issue, Apple has established a Repair Program to replace the Apple-branded cache in affected Power Macintosh 7500/100 computers.

If your Power Macintosh 7500/100 computer does not start up after installing the Power Macintosh 256K L2 Cache DIMM, contact an Apple-authorized service provider or (800) SOS-APPL to set up the repair.

If your Power Macintosh 7500/100 computer experiences similar symptoms with L2 cache from a third-party company, contact the vendor for assistance. Apple has contacted developers regarding this potential issue and has recommended a solution.

The Repair Program is effective immediately and is scheduled to run for approximately six months, ending on May 31, 1997.

* Note: There are two part numbers associated with the Power Macintosh 256K L2 Cache DIMM. M3808LL/A is the part number for the L2 Cache DIMM that customers have purchased. 661-1035 is the service part number for the L2 Cache DIMM that Apple-authorized service providers can order. Both part numbers refer to the same product.

LaserWriter 4/600 PS: Using A4 Paper In Cassette Tray (8/96)

Revised: 8/21/96
Security: Everyone

LaserWriter 4/600 PS: Using A4 Paper In Cassette Tray (8/96)

=====

Article Created: 21 August 1996

TOPIC -----

I am trying to use A4 paper in the cassette tray of my LaserWriter 4/600 PS, but after several pages have printed the paper out LED turns on even though there is plenty of paper in the cassette tray. When I pull out the cassette tray and reinsert it the paper out LED turns off and the printing resumes. How can I correct this problem?

DISCUSSION -----

The LaserWriter 4/600 PS ships with a default configuration that sets the cassette tray paper size to US Letter. Customers in European and Pacific countries that use the A4 paper size need to change the default paper size from US Letter to A4 using the Apple Printer Utility paper handling configuration option. Paper sizes such as legal can also be set using the same procedures.

Most Apple LaserWriters use a series of microswitches and actuators to detect the paper size installed in the cassette tray. The universal cassette tray designed to support a variety of paper sizes automatically reconfigures the actuators for the appropriate paper size. The LaserWriter 4/600 PS does not have the capability to detect the paper size and therefore relies on the information stored in the printer's controller circuitry.

LaserWriter 16/600 PS: IOP 3.0 Release Notes (2/97)

Revised: 2/19/97
Security: Everyone

LaserWriter 16/600 PS: IOP 3.0 Release Notes (2/97)

=====

Article Created: 21 August 1996
Article Reviewed/Updated: 19 February 1997

TOPIC -----

The IOP (Input-Output-Processor) ROM on the LaserWriter 16/600 PS has been revised to version 3.0. This article includes information on how to identify the IOP ROM version, and a change history listing many of the changes made since IOP v2.0.

DISCUSSION -----

The 3.0 version IOP ROM (922-2458) is now available from Service. Should a LaserWriter 16/600 PS printer experience a network-related printing problem, the IOP ROM should be checked and upgraded to version 3.0 if necessary.

The IOP ROM can be checked by inspecting a startup test page. On a startup test page, the version number of the IOP ROM will be listed along the right edge of the page. Alternatively, the IOP ROM version number can be checked with the Apple Printer Utility software program.

Numerous improvements were rolled into v3.0 IOP ROMs. The issues addressed are listed below.

Ethernet
=====

Issue: Lock-ups (the printer stops responding to network traffic).

Resolution: Fixed. One such fix was the Ethernet driver receive routines were modified to handle reception of packets greater than the maximum legal size (1518 bytes including the 4 byte CRC). Previously, reception of an illegal sized packet greater than 1518 bytes caused the IOP to "crash".

AppleTalk
=====

Issue: Printer's EtherTalk stack stops responding during or after a broadcast storm: the printer disappears from the EtherTalk network even though TCP/IP and IPX continues to function.

Resolution: Fixed. The EtherTalk stack will now reregister after a long broadcast storm that caused it to lose contact with its router.

Issue: Unexplained, random PostScript errors.

Resolution: Fixed. This is a very rare problem that if encountered, is only likely to be observed on very busy networks or during broadcast storms, or even less likely, when the printer is receiving a lot of data very quickly.

Issue: Helios EtherShare Print Server doesn't successfully print to a LaserWriter 16/600 with the EtherShare Accounting feature on.

Resolution: Fixed. The LaserWriter 16/600 now works with EtherShare whether Accounting is enabled or disabled.

Issue: The LW 16/600 registers on the network with an enumerated name even if there were no other printers in that zone with the same name.

Resolution: Fixed. Previously at startup the printer temporarily registers in the default zone prior to registering in its proper zone. If there were other printers with the same name in the default zone, it would register with an enumerated name.

Issue: The printer appears in different zone than was set with the Apple Printer Utility.

Resolution: Fixed. Previously the printer would accept then store in NVRAM an invalid ZIP GetNetInfo response. It no longer stores this value in NVRAM. Now if the connection with that router is lost and the current zone is default, the printer will return to the zone stored in NVRAM set by the Apple Printer Utility.

Issue: EtherTalk now stores its current network number in NVRAM and uses this number as its first guess on startup.

Issue: On very slow WAN network links, connections may have timed out.

Resolution: Fixed. The AARP Request interval and maximum retry count were increased.

Issue: Enhanced the error recovery algorithm for Open Connection transactions. Previously a lost TREL from the host to the LW 16/600 would confuse the LW 16/600.

TCP/IP

=====

Issue: The LW 16/600 previously accepted BOOTP (and DHCP) response packets intended for a different host and would assume that host's IP address.

Resolution: Fixed.

Issue: The printer would accept IP packets with the correct hardware address but wrong IP address.

Resolution: Fixed.

Issue: The TCP/IP stack could acknowledge a FIN request from the other node before all of the data was received.

Resolution: Fixed.

Issue: Entering an IP password longer than 10 characters could cause a telnet connection to lock up.

Resolution: Fixed.

Issue: Trying to change the password from telnet under Open Windows would cause the telnet port to lock up.

Resolution: Fixed.

Issue: The LW 16/600 prints an old TCP/IP address at boot up when using RARP.

Resolution: Fixed. The printer will now either print the new address if it has been received, or 0.0.0.0 if it is still waiting for a RARP reply.

Issue: The printer now uses the Subnet Mask and Default obtained from BOOTP, RARP or Gleaning.

Issue: Some IP addresses, Subnet Mask or Default Gateway values were not set properly with the LaserWriter utilities.

Resolution: Fixed.

NetWare/IPX

=====

Issue: To avoid unnecessary IPX network traffic when NetWare is enabled (the factory default), the LW 16/600 stops looking for NetWare servers five minutes after startup provided the printer has not been configured for NetWare via LWPMAN. If the printer was configured for Netware via LWPMAN, it will advertise every 60 seconds to allow LWPMAN to be able to reset or configure the protocol.

Issue: Printer appeared to a Netware spooler running in Rprinter mode to be rebooting or locked up when it wasn't.

Resolution: Fixed.

Issue: NetWare 4.xx jobs with a banner did not print when the job was submitted to an aliased queue when the user submitting the job was logged in under a different context than the queue was created in.

Resolution: Fixed. The NetWare 4.xx banner printing problem when using NDS aliased queues was corrected.

Article Change History:

19 Feb 1997 - Information on identification & availability of 3.0 ROMs.

27 Sep 1996 - Corrected ship date of v3.0 ROMs.

Where to Get Technical Support in Europe (8/96)

Revised: 8/21/96
Security: Everyone

Where to Get Technical Support in Europe (8/96)

Article Created: 21 August 1996

TOPIC -----

This article describes where to get technical support for Apple products in Europe.

DISCUSSION -----

For technical support on Apple products in Europe, you have a number of options:

- Contact the supplier of your local Apple Product - Ask your Apple dealer or retailer for advice on solving your technical question.
- Help Line (Telephone) Support - The European Apple Assistance Centers provide telephone support in the local language to Apple customers in Austria, Belgium, Denmark, Finland, France, Germany, Ireland, Luxembourg, Netherlands, Norway, Sweden, Switzerland, and the U.K. There are also Support Centers in Italy and Spain.

Generally, there is free "up-and-running" support for customers of Apple products for a fixed period after purchase, and fee-based support thereafter or as a premium service. Contact your local center for details:

Begin_Table

Austria	Tel: 0660 / 6764	Fax: 0660 / 6765
Belgium(Flemish)	Tel: 0800-713.94	
Belgium(French)	Tel: 0800-713.95	
Denmark	Tel: 800 172 91	Fax: 800 172 90
Finland	Tel: 0800 118 083	Fax: 0800 118 085
France	Tel: (1) 69 29 29 29	
Germany	Tel: 0180/35018	
Ireland	Tel: (01) 6761650	
Italy	Tel: 39-2-27326292/3/4/5/6	Fax: 39-2-27326518

Luxembourg	Tel: 0800-2069	
Netherlands	Tel: 06-022.1517	
Norway	Tel: 800 110 06	Fax: 800 118 01
Spain	Tel: 902 100 088	
Sweden	Tel: 020-793 016	Fax: 020-793 019
Switzerland	Tel: 0800/833 310	Fax: 0800/822 210
U.K.	Tel: 0990 127753 (1-APPLE)	

End_Table

Some Assistance Centers also operate a 24 hour Fax-on-Demand service, normally available as an option from the main help-line number. Apple France offers a Minitel service on "3615 APPLE".

Protect Applications Folder Error Messages (8/96)

Revised: 8/21/96
Security: Everyone

Protect Applications Folder Error Messages (8/96)

=====

Article Created: 21 August 1996

TOPIC -----

With the Protect Applications folder option selected in the General Controls control panel, two different error messages appear depending on what I try to remove from the Applications folder:

- If I try to move a folder from the Application folder to the startup drive icon, I get "You cannot move 'folder name' to the disk 'disk name', because it is locked."
- If I move a file, I get the correct message indicating that folder protection is turned on.

DISCUSSION -----

This is an issue with file protection and should be addressed in a future release of system software. Both error messages indicate that folder protection is on.

Color StyleWriter 1500: Version 2.2 Read Me (8/96)

Revised: 8/22/96
Security: Everyone

Color StyleWriter 1500: Version 2.2 Read Me (8/96)

=====

Article Created: 22 August 1996

TOPIC -----

This article contains the Color StyleWriter 1500 v2.2 ReadMe file.

DISCUSSION -----

Information About Your Color StyleWriter 1500 Printer

This document contains important reminders and some information that's not in the user manual.

IMPORTANT:

Because of data compression, it may take Disk 1 up to 12 minutes to install its contents onto your hard disk. The other disks will work much more quickly.

Contents

=====

- Installation Alert
- Apple Color Printing CD
- Low-memory Troubleshooting
- Color Printing
- Other Printing Tips
- Desktop Printing
- Watermarks
- Printing With QuickDraw GX
- Using the Color StyleWriter 1500 With Application Programs

Installation Alert

Because of data compression, it may take installer Disk 1 up to 12 minutes to install its contents onto your hard disk. The other disks will work much more quickly.

Apple Color Printing CD

If you have problems with the software on the Apple Color Printing CD, contact the appropriate manufacturer:

- for Personal Publishing Toolkit, contact GDT, 604-473-3678
- for StickerShop Plus!, CardShop Plus! or Calendars and More, contact Mindscape, 415-898-5157
- for help with the fonts, contact Bitstream, 617-497-7514

Low-Memory Troubleshooting

If you notice any of these symptoms, your Macintosh may be running out of memory.

- The Macintosh displays "out of memory" warning messages.
- Some portions of a document don't print.
- Printing is very slow.

To make more memory available, try these suggestions:

- Have only one program open at a time.
- Increase the amount of memory you give to the program you're printing from by using the Get Info command (as explained in the documentation that came with your Macintosh).
- Use the Chooser to turn off background printing, as explained in Chapter 2 of the user manual.
- In the Page Setup dialog box, choose Portrait (normal) orientation instead of Landscape (sideways) orientation.
- Remove any watermarks from your document.
- Desktop printing requires more memory to print than PrintMonitor 7.1.2. You can remove desktop printing by using the custom remove option called "Desktop Printing Software."
- When you print in the background, if you often get a message that there is not enough memory to print on a certain desktop printer, you can give that desktop printer more memory by selecting its icon and choosing the Get Info command. Then increase the number in the Preferred Size box. (For more information on increasing a program's memory, see the documentation that came with your Macintosh.)
- Use the Memory control panel to turn on virtual memory, as explained in the documentation that came with your Macintosh.

Color Printing

- When printing very light colors in grayscale mode, you may see thin lines fade or break up. If this happens, pick a darker color for the affected object, or try printing with the Pattern halftoning option selected. (In the Print dialog box, click the Color button, then select the Pattern option.)
- If you print a document that should have a smooth gradient from one color or shade to another and notice an unexpected color change, it may be that one of the colors in the gradient cannot be reproduced by the printer. Try using a different matching method in the Color Options dialog box, or try turning off ColorSync.
- If the color blue on your printout appears purple, turn on ColorSync in the Color dialog box.
- In some programs, colors on the screen may look solid but contain tiny dots when printed. To print solid blocks of color without these dots, use the Business Graphics color-matching method. In the Print dialog box, click the Color button. In the Color Options dialog box that appears, make sure there is an X in the ColorSync box, and then select Business Graphics from the Matching Method pop-up menu.

If your colors still have too many dots, create the document in a program that allows you to define each color, then make the color fully saturated. For example, to print yellow without any dots in it, use your application program to define the yellow you are using as 100% red, 100% green, and 0% blue.

Other Printing Tips

- For faster printing of black and white pages, use the black cartridge instead of the color cartridge.
- If you see random fine lines within a landscape printout, change the orientation to portrait if possible.
- If you see very thin stripes near the bottom of your printout, use your application program to make your bottom margin larger. A bottom margin of 0.5 inches or greater is best.
- For best results when printing envelopes, do not put images or text along the bottom edge of the envelope.
- If you get the message, "Serial port in use by another application, please quit the application and try again," restart your Macintosh before trying to print again.
- Close the Chooser after making any changes to it.
- To avoid confusion when sharing your printer, be sure to give each shared Color StyleWriter 1500 printer a unique name. If you have more than one printer with the same name in a single AppleTalk zone, the Chooser will display only one of them.

Desktop Printing

- If no desktop printer icons appear after you follow the instructions in Chapter 1, it may mean the Installer program installed PrintMonitor 7.1.2 instead of the desktop printing software. This can happen if you are running system software version 7.5 or earlier in a language other than English. You have three choices:
 - Use the PrintMonitor 7.1.2 that was installed.
 - Upgrade to System 7.5.1, and then install the Color StyleWriter 1500 software again.
 - Use the Installer program's Custom Install feature to install the desktop printing software. This option, however, also installs an English-language version of the Finder.
- When you choose Save or Open in your application programs, you will see your desktop printers listed as if they were folders, but you should not save or open any documents in them. If you do, you will not be able to access your documents.
- If you want to have more than 3 desktop printers, you must increase the Desktop PrintMonitor memory allocation by 10K for each additional desktop printer you want. To do so, select the Desktop PrintMonitor icon--it's in the Extensions folder inside the System Folder--choose Get Info, type a larger number in the Preferred Size box, then close the Get Info window.

Watermarks

- When using a watermark, make sure the font that is in the watermark file is also in the Fonts folder inside your System Folder. If you give the watermark file to someone, they also need any fonts that it uses in order to use the watermark in their own documents.
- If you are printing a diagonal watermark such as Draft or Final on A4 or Legal size paper, for best results use Centered or Align Top Left orientations.

Printing With QuickDraw GX

- If you have QuickDraw GX on your system, the Color StyleWriter 1500 Installer will automatically install everything you need for printing with QuickDraw GX.
- If you installed QuickDraw GX after you set up your Color StyleWriter 1500, you must reinstall the Color StyleWriter 1500 software.
- After you click the Print button to print a complex document, you may notice a delay before you see printer activity.
- If printing with QuickDraw GX doesn't produce satisfactory results, you can use the GX Helper utility to turn off QuickDraw GX and use the regular QuickDraw

printing software. For more information, see Appendix E of your user manual.

Using the Color StyleWriter 1500 With Application Programs

If you have problems printing from a specific program, it may be a problem in that program. If you have problems, contact the publisher of the program. In some cases a newer, more compatible version of the software may be available.

- In some programs—such as Microsoft Word 5.1, WordPerfect 3.5 and ClarisWorks 4.0—rotated text created within the program may print with jagged edges. For best results, create the rotated text in another program and paste it in.

Notes About Specific Programs

The following list describes some special situations that you should be aware of when working with specific programs. (There may be other problems with these programs or with other programs not mentioned in this document).

Adobe Type Manager

- When you install version 3.8.1 or later of Adobe Type Manager, some system fonts are removed from your system and placed in a folder called "De-installed Fonts1". If you later turn off ATM, drag all the fonts in the "De-installed Fonts1" folder back into the Fonts folder inside the System folder to prevent characters with jagged edges.
- If you get incorrect output when you try to print rotated and flipped Adobe Type 1 fonts, try using a TrueType font instead.

Adobe Illustrator 5.0

- Unless you have at least 15-20 MB of free disk space on your startup disk, you will see a "disk is full" error message when you try to print. The more complex the document, the more space you need.

Adobe Persuasion 3.0

- If you are having difficulty cancelling printing from Persuasion try turning off ATM.

Adobe PageMaker 5.0

- To see the Color StyleWriter 1500 Page Setup and Print dialog boxes, click the Setup button in PageMaker's Print dialog box.
- When printing rotated PICT or EPS images, be sure background printing is turned on in the Chooser. If you must print in the foreground, rotate the image in another program, then import it into PageMaker in the orientation in which you plan to print it.
- PageMaker 5.0 prints pages in reverse order on the Color StyleWriter 1500, which may be particularly confusing if you are using 2-up or 4-up printing. To

print the first page first, turn on the Reverse Order option in the Print dialog box.

- Try changing the monitor depth from thousands or millions to 256 if you are having difficulty printing a particular document.

CardShop Plus! 1.0, Calendars and More 1.0, StickerShop Plus! 1.0

- If you are using QuickDraw GX, do not use GX Helper with these applications.

ClarisDraw 1.0v2

- If you have problems printing in the background, you may want to increase the Desktop PrintMonitor extension's preferred size to 300K (by using the Get Info command, as explained in the instructions that came with your Macintosh). The extension is located in the Extensions folder inside your System Folder.

DeltaGraph Pro 3.0.4

- When printing charts, always click the QuickDraw button in the Print dialog box.

FrameMaker 5.0

- If you import text as a graphic, you can crop it on the screen but it will print uncropped.
- Rotated text in large point sizes will print as a gray box. For best results, break up the text blocks into smaller pieces or individual characters.
- For best results use TrueType fonts when printing rotated text.
- Do not mix portrait and landscape pages in the same document.

MacDraw II 1.1 v2

- To print in color, be sure to turn on the Print Color Patterns in the Print Options dialog box and select Color in the Image pop-up menu in the Print dialog box.
- If you experience problems when printing your MacDraw II document with layout of 2-Up or 4-Up, try using a different program, like ClarisDraw.

Microsoft Excel 4.0 and Lotus 1-2-3

- To print in color, be sure to check the Print Using Color option in the Print dialog box and select Color in the Image pop-up menu.

Microsoft Excel 5.0

- If colored cell borders drop out when printing, try using yellow or brown or you can use the line tool in the Drawing tools palette.

- When you choose the Page Setup command, you get Excel's own version of the Page Setup dialog box. Click the Options button to see the version of the dialog box with the special Color StyleWriter 1500 options.

Microsoft Word 6.0

- When you cancel a print request from MicroSoft Word 6.0, some of the document will still print. If you are using desktop printing, try stopping the print queue on your desktop printer and then removing the print request instead of cancelling. To do this, click on you desktop printer icon and select Stop Print Queue from the Printing menu.

- For best results when printing envelopes, choose Envelopes and Labels from the Tools menu. Then click the Feed icon. In the Envelope Options dialog box that appears, click the second icon from the left, and make sure that Face Up is selected.

Ofoto 2.0.2

- For best results, make a custom calibration for the Color StyleWriter 1500 and click the Custom Profile button.

Print Shop Deluxe 1.1.1

- If you are getting off-center and incomplete printouts of cards, try restarting your Mac.

QuickMail 3.5 and earlier versions

- If you are getting rectangles instead of characters in your QuickMail printout, try selecting Text Only in the Print Dialog box.

Studio/8 v 2.0 and Studio/32 v 1.2

- Always click the QuickDraw button in the Print dialog box.

Desktop PrintMonitor 2.0: Read Me File (8/96)

Revised: 8/22/96
Security: Everyone

Desktop PrintMonitor 2.0: Read Me File (8/96)

=====

Article Created: 22 August 1996

TOPIC -----

This article contains the ReadMe file for the Desktop PrintMonitor 2.0 software.

DISCUSSION -----

Desktop PrintMonitor 2.0

This document contains some late-breaking information and tips not included in the manual that came with your printer. You may want to print this document and keep it for future reference.

The topics are:

- System Recommendations
- New Features in Version 2.0
- Hints and Shortcuts
- How to Use Desktop PrintMonitor
- Support and Compatibility Information
- Troubleshooting Tips
- Software Components Installed With Desktop PrintMonitor

System Recommendations

- An Apple Macintosh or PowerBook personal computer with a 68020 or later processor, a Power Macintosh, or another Mac OS-based personal computer
- 5 megabytes (MB) of RAM
- Macintosh Operating System (Mac OS) version 7.1 or later

New Features in Version 2.0

- Desktop printer icons can be moved off the desktop and into folders.
- A printer menu located on the right-hand side of the menu bar provides a

convenient means to switch the user's default printer.

- A control strip module with functionality identical to the printer menu is provided for PowerBook systems and other systems employing the Control Strip software.

Hints and Shortcuts

- The Desktop Printers folder in the Apple Menu provides a convenient shortcut to desktop printers. This is especially helpful if you have moved your desktop printer icons off the desktop.
- Command-L key combination is a shortcut equivalent to the Set Default Printer command in the Printing menu.
- Holding down the Option and Shift keys makes the Hold and Resume buttons function as Stop Print Queue and Start Print Queue.
- To print additional copies of a file, you can select the spool file waiting in the print queue and choose Duplicate from the File menu.

How to Use Desktop PrintMonitor

Creating Desktop Printers

You create desktop printers by selecting a printer in the Chooser. A desktop printer icon appears on your desktop when you close the Chooser.

The printer icon is initially placed on the desktop. After the icon is created, you can move it to any location on your startup drive.

If you wish to create other desktop printers, you must open the Chooser and select the desired printers one at a time. You must close the Chooser each time to create a desktop printer.

The last desktop printer created becomes the default printer. Your documents will automatically be printed on the default printer.

Printing With Desktop Printers

You can print documents within your applications as you normally do. You can also print documents without leaving the Finder, using one of the two methods described here. These methods are particularly efficient when you have a number of documents you want to print at once.

- Drag the icons of the documents you want to print to the desktop icon of the printer you want to use.
- Select the icons of the documents you want to print and choose the Print command from the File menu.

The Print dialog box appears. Make your choices, then click the Print button.

After a few moments, the document starts to print. If background printing is turned on, you can continue working while the document is printing.

Selecting a Default Printer

If you have more than one printer available, you can select which you want to use. The printer you select is called the default printer. All your documents will be printed on the default printer until you select a new one.

To change the default printer, use one of these five methods:

- Drag the document you want to print to a desktop printer icon, and it will automatically become the default printer.
- Select the desktop printer icon and use the Printing menu to set the printer as the default.
- Select a new printer using the Chooser.
- Select the printer name in the System Printer Menu.
- Select the printer name from the Control Strip.

Note: Switching between printers may change how much information you can fit on a page. It's best to choose a printer before you spend much time formatting the document.

Working With Desktop Printer Icons

Desktop printer icons change to indicate printing status:

[Graphics Not Available in Tech Info Library Article]

You can do the following with desktop printer icons:

- Throw away the icon. Drag the icon to the Trash. You can't throw away a desktop printer icon while the printer is printing a document. (You can create another desktop printer icon for that printer whenever you like.)

Note: You must always have at least one printer icon on your desktop. If you throw away the last icon, it will immediately be created again.

- Rename the icon. Rename the icon as you would any other Finder icon. Click the name to highlight it, then type the new name. This changes the name of the icon, not the name of the printer.
- Create an alias for the icon. You may create an alias for the icon as you would any Finder icon, by selecting the icon and choosing the Make Alias command from the File menu.

Monitoring Printing

If you are using background printing, you can use the desktop printer features to monitor and control the documents that are waiting to print. To learn how to turn background printing on and off, see your printer manual.

To monitor the printing of documents:

1. Double-click the desktop printer icon you're interested in.

A window opens listing the documents that are printing or waiting to print.

Watching the status messages can be helpful when troubleshooting printing problems. When more than one job is waiting to be printed, a list of print jobs appears in the waiting list, showing the order in which they will be printed (when sorted by print time.)

2. Choose what you'd like to do:

- To cancel a print request, select it by clicking its title or icon and click the Trash icon button

You can also drag the icon for the print request to the Trash. Note that these methods delete only the print request (also referred to as a spool file), not the document itself.

- To put a print request on hold, select it and click the Hold button.

The print request will stay on hold until you select it again and click the Resume button. You can also put the document that's currently printing on hold by dragging it to the list of documents waiting to print (lower part of the window).

- To indicate that a print request is urgent, select it and put it on hold. Next, click the Set Print Time icon button. In the dialog box that opens, click Urgent. Another way to make a job urgent is to drag the job from the waiting area of the print queue to the top of the queue or to the area reserved for the currently printing job.

- To indicate that a print request should not print until a future time, select it and click the Set Print Time icon button. In the dialog box that opens, click At Time, then set the time you want.

- To change the order of the items waiting to print, drag their titles up or down in the list.

- To sort the list of documents waiting to print, click the title of the column you want to sort by.

For example, to sort by the name of the document, click Document Name (you can also sort by choosing the commands in the View menu). The column title you sorted by is underlined. Sorting the items does not change the order in which they will print. To see that order, sort by Print Time.

- To temporarily stop all documents from printing on this printer, choose Stop Print Queue from the Printing menu.

To resume using the printer, choose Start Print Queue from the Printing menu.

Shortcut: The Printing menu for starting and stopping the print queue is available without opening the window for the printer, as long as the printer's icon is selected.

- To move a print request from one printer to another printer of the same type (for example, from a LaserWriter 4/600 PS to a LaserWriter 16/600 PS), drag the

icon for the print request to the icon of the printer where you want to move it.

You can only move a print request from a PostScript printer to another PostScript printer. The printing software won't let you move a print request to an incompatible printer. For example, you can't move a request from a LaserWriter printer to a StyleWriter printer.

Turning Off or Removing the Desktop Printing Software

Removing a Desktop Printer Icon

You can remove an individual desktop printer icon by dragging it into the Trash. If you have only one desktop printer, you can't get rid of the icon by dragging it to the Trash (the icon will reappear if you do). To get rid of the desktop printer, you must first select a different desktop printer as the default printer and then drag the desktop printer icon to the Trash. If you don't want to use desktop printer icons, see "Turning Off the Desktop PrintMonitor" or "Removing Desktop Printing Software" for information about how to remove the desktop printer software.

Turning Off the Desktop PrintMonitor

If you don't want to use desktop printers, you can turn off the Desktop PrintMonitor using the Extensions Manager (available with version System 7.5 of the Mac OS).

To turn off the Desktop PrintMonitor:

1. Open the Extensions Manager control panel in the Control Panels folder.
2. Click to deselect (uncheck) the Desktop PrintMonitor, Desktop Printer Extension, Desktop Printer Spooler, and Desktop Printer Menu extensions in the panel.
3. Click the close box to close the control panel.
4. Restart your computer.

Removing the Desktop Printing Software

The desktop printing software uses both the Desktop PrintMonitor and the PrintMonitor software. The Desktop PrintMonitor requires 200-400K bytes more free system memory in addition to the memory required by the PrintMonitor. If you don't want to use the desktop printing software, you can remove it.

To remove desktop printing software:

1. Drag any print spool files found in the PrintMonitor Documents folder (in the System Folder) to the Trash.

WARNING: These jobs will not be printed.

2. Restart your computer with the extensions off by holding down the Shift key and choosing Restart from the Special menu. Hold the Shift key down until the message "Extensions Off" appears or until your normal desktop appears.

3. Drag the following files from the Extensions folder to the Trash:

Desktop PrintMonitor
Desktop Printer Spooler
Desktop Printer Extension
Desktop Printer Menu

4. Restart your computer.

Support and Compatibility Information

- Some third-party printers do not support desktop printing. If your printer is not an Apple product, and no desktop printer icon is created after you select your printer in the Chooser, it is likely that your printer does not support Desktop PrintMonitor. Please contact the vendor of your printer to see if there is a version of the driver that is compatible with Desktop PrintMonitor.

- When you choose Save or Open in your application programs, you will see your desktop printers listed as if they were folders, but you should not save or open any documents in them. If you do, you will not be able to access your documents.

- Desktop PrintMontitor supports drag-and-drop printing for all files that cause the Print Command in the File menu to become enabled. Since clipping files do not enable the Print command, drag and drop is not supported for them.

- Apple's Fax Sender software is not supported by Desktop PrintMonitor. Fax Sender is fully functional when Desktop PrintMonitor is installed; however, it does not get the benefit of Desktop PrintMonitor's features. When you select Fax Sender in the Chooser, you will not have a default desktop printer until you choose a printer icon and choose Set Default Printer from the Printing menu.

Troubleshooting Tips

Error message "-192" or "15"

Problem: After installing Desktop PrintMonitor and restarting your Mac OS-based computer, you see error message "-192" or "15" when you try opening files or folders in the Finder. This may occur when Now Startup Manager's preferences file has become corrupted.

Solution: Restart your computer with extensions disabled (hold down the Shift key while restarting), delete Now Startup Manager's preferences file, and restart the computer again with extensions enabled. Important: Before deleting your Now Norton Startup preferences, you may want to record them or write them down before you delete this file.

Desktop printer cannot be found

Problem: When you try to print, your spool files are moved to the Trash and an alert message is displayed saying that the desktop printer could not be found.

Solution: There are two likely solutions to this problem. First, it is possible that your desktop printer has somehow become damaged. To fix this, drag the desktop printer icon to the Trash and reselect the printer in the Chooser. A new desktop printer icon will be created.

Second, your printer software may not be using a file format that is completely compatible with Desktop PrintMonitor. If your printer software is not published by either Apple Computer or Adobe Systems, it is possible that it is not making proper and legitimate use of PrintMonitor. If this is the case, your printer software will not work properly with Desktop PrintMonitor. The only resolution to this problem is to disable Desktop PrintMonitor and use old PrintMonitor. To print the documents you were working on follow these steps:

1. Empty the Trash.
2. Go to the Chooser and turn off background printing.
3. Print documents again.

To correct desktop printing:

4. Drag the desktop printer to the Trash.
5. Go to the Chooser and turn background printing back on.
6. Create a new desktop printer.

Not enough memory message when dragging files to desktop printer

Problem: When you drag documents created by different software applications to your desktop printer icon, a message is displayed indicating that there is not enough memory to continue.

Solution: The application used to create a document will launch when the document is printed. You may not have enough memory available to launch all of the software applications corresponding to the documents you have selected. You can resolve this situation by printing your documents individually or in smaller groups.

Options dimmed in Printing menu

Problem: Get Printer Info and Change Setup commands appear in your Printing menu, but can't be selected.

Solution: These are two new functions supported by LaserWriter v8.4. If these or other items in the menu appear dimmed and cannot be selected, it is because you are using a version of the printing software that doesn't support their respective functions.

"Out of Paper" message remains

Problem: The LaserWriter 300 "Out of Paper" message doesn't automatically go away when paper is added to the printer.

Solution: This feature does not work with Desktop PrintMonitor and LaserWriter 300 driver. The only way to work around this problem is to disable Desktop PrintMonitor and use old PrintMonitor.

Documents printed to Color StyleWriter vary in appearance

Problem: Documents printed to your Color StyleWriter look different if their printing is resumed on page two (or any later page).

Solution: With the current version of Desktop PrintMonitor and the Color StyleWriter, it is possible to lose color-matching information if a print job is put on hold and then resumed on a later page. The best way to address this problem is to resume printing on page one.

Software Components Installed With Desktop PrintMonitor

The Desktop PrintMonitor Installer places the following files in your System Folder:

- Desktop Printer Extension (in Extensions folder)
- Desktop PrintMonitor (in Extensions folder)
- Desktop Printer Spooler (in Extensions folder)
- Desktop Printer Menu (in Extensions folder)
- Printer Selector (in Control Strip Modules folder, if it exists)

If you are using a version of the Mac OS earlier than System 7.5.1, you also get:

- Finder 7.5.1 (in System Folder) provides improved compatibility
- Finder Help and Network Extension (in Extensions folder) to support Finder 7.5.1
- Clipping Extension, Dragging Enabler, Macintosh Drag and Drop, and Thread Manager (in Extensions folder) to support the interface and messages within Desktop PrintMonitor

MessagePad 120: System Update 2.0 (516205)US Read Me (4/97)

Article Created: 22 August 1996
Article Reviewed/Updated: 28 April 1997

TOPIC -----

This article contains the Apple MessagePad 120 System Update 2.0 (516205)US ReadMe document.

DISCUSSION -----

This document describes the product enhancements included in the system update file named 'MessagePad 120 2.0 (516205)US'.

System Update 2.0 (516205)US is for Apple MessagePad 120 customers in the United States. This version will install over the following system software versions for MessagePad 120:

version 2.0 (515264)
version 2.0 (515299)

If this system update is already installed on your MessagePad, you will not damage your MessagePad by reinstalling the update. Also, you will not damage an original MessagePad, MessagePad 100, MessagePad110, MessagePad 130 or other Newton PDA if you attempt to install this system update by mistake.

Before you install any system update, you should backup your MessagePad 120 with the Newton Backup Utility or to a storage PC card (PCMCIA card).

New changes in System Update 2.0 (516205):

Multi-page documents or faxes now print all pages correctly in landscape orientation.

Fixed a problem with NBU Restore that would cause error -28207 and the unit to restart.

Fixed a problem identifying some new PCMCIA modems, including the Megahertz CruiseCard XJ3288 28.8 LandLine/Cellular modems.

Fixed a problem with changing sorting orders which could occur when switching between Swedish and English.

Fixed a problem with applications that allocate large chunks of store memory. (This is particularly prevalent with applications that use the Newton Internet Enabler.)

Tapping stop during installation with NBU of a package file or a System Update now works.

The " MessagePad" text has been removed from the reset and sleep screens.

The Stylewriter 1500 and 2500 have been added to the printer list.

Pending alarms no longer trigger immediately after setting the clock to the day of the alarm.

Deleting found ToDo's from the Find overview no longer causes a -48809 error.

Fixes in System Update 2.0 (515299) REMOVED in System Update 2.0 (516205): (In order to provide enough memory space for fixes of the above serious problems, the following fixes from the earlier patch have been removed.)

Removed a fix that allowed items located with Find in the I/O Boxes to be filed to new folders.

The "annotation button" in the Bookplayer toolbar will not be underlined when annotations exist on the current book page until the Annotation button is tapped.

Creating a new meeting/event by dragging text via the clipboard (eg from the Notepad) will create a alarm time that is random if you set the default alarm time(s) to something besides 'none'. You will have to correct the alarm time after closing and re-opening the new meeting.

Apple MessagePad 120: System Update 2.0 Instructions (8/96)

=====

Article Created: 22 August 1996

TOPIC -----

This article contains the Installation Instructions for System Update MessagePad 120 2.0 (516205)US document. This version of the instructions is for Macintosh owners.

DISCUSSION -----

Q. How do I install System Update 2.0 (516205)US?

A. BEFORE installing a MessagePad System Update, as precautionary measure you should backup your information. You can do this using your computer and the Newton Backup Utility, or a PCMCIA card. Installing a MessagePad System Update will not normally erase any information in your MessagePad.

Once you've backed up your information, install the MessagePad System Update following the instructions below.

WARNING: YOU SHOULD READ THE '2.0 (516205) Read Me' FILE BEFORE YOU FOLLOW THESE INSTRUCTIONS: Due to size limitation in the memory used by the System Update, some fixes in the previous System Update 2.0 (515299) were removed from System Update 2.0 (526205).

Before you install the System Update (516205), check to see what system version you currently using. Follow these steps:

1. Connect your MessagePad to your Macintosh.
2. Turn on your computer and your MessagePad 120.
3. On your computer, double-click the Newton Backup Utility icon to launch the application.
4. On your MessagePad 120, tap Extras to open the Extras Drawer.

5. Tap the Information button ("i") near the bottom of the screen.

6. Tap "Memory Info".

* If the ROM version number at the middle of the screen is not 2.0 (516205)-1 or a higher number you need to install system update MessagePad 120 2.0(516205)US. Go to step 7.

* If the ROM version number at the middle of the screen is 2.0 (516205)-1, you already have the current system software version and you can stop.

7. On your MessagePad 120 tap on Connect.

8. On your computer, choose Install Package.

9. Select the file "MessagePad 120 2.0 (516205)US". A message appears saying "New system software is about to be installed. Please tap Restart."

10. Tap Restart.

11. Wait for your MessagePad 120 to restart (about 3 seconds).

12. Tap Extras to open the Extras Drawer.

13. Tap the Information button ("i") near the bottom of the screen.

14. Tap Memory info. If the software was installed correctly, the ROM version number at the middle of the screen should be 2.0 (516205)-1

If you have questions about installing the software, please see the manual that came with your MessagePad, call (800) SOS-APPL in the US, or call the Apple Support Center in your country.

Apple MessagePad 120: System Update 2.0 PC Instructions (8/96)

=====

Article Created: 22 August 1996

TOPIC -----

This article contains the Installation Instructions for System Update MessagePad 120 2.0 (516205)US document. This version of the instructions is for PC/Windows owners.

DISCUSSION -----

Q. How do I install System Update 2.0 (516205)US?

A. BEFORE installing a MessagePad System Update, as precautionary measure you should backup your information. You can do this using your computer and the Newton Backup Utility, or a PCMCIA card. Installing a MessagePad System Update will not normally erase any information in your MessagePad.

Once you've backed up your information, install the MessagePad System Update following the instructions below.

WARNING: YOU SHOULD READ THE README.TXT FILE BEFORE YOU FOLLOW THESE INSTRUCTIONS Due to size limitation in the memory used by the System Update, some fixes in the previous System Update 2.0 (515299) were removed from System Update 2.0 (526205).

Before you install the System Update (516205), check to see what system version you currently using.

Follow these steps:

1. Connect your MessagePad to your PC. Use a cable that has a 9-pin serial connector at one end and a mini DIN-8 connector at the other. (If you have a 25-pin serial port, use a 9-pin to 25-pin adapter, along with the above cable.) Choose an available serial port on your PC and connect the end of the cable with 9 pins to the appropriate port. Plug the other end of the cable into the MessagePad's communication port.

2. Turn on your computer and your MessagePad 120.
 3. On your computer, double-click the NBU icon or use File/Run on execute NBU.EXE.
 4. On your MessagePad 120, tap Extras to open the Extras Drawer.
 5. Tap the Information button ("i") near the bottom of the screen.
 6. Tap "Memory Info".
- * If the ROM version number at the middle of the screen is not 2.0 (516205)-1 or a higher number you need to install System Update MessagePad 120 2.0(516205)US. Go to step 7.
- * If the ROM version number at the middle of the screen is 2.0 (516205)-1, you already have the current system software version and you can stop.
7. On your MessagePad 120 tap on Connect.
 8. On your computer, choose Install Package.
 9. Select the file "MessagePad 120 2.0 (516205)US". A message appears saying "New system software is about to be installed. Please tap Restart."
 10. Tap Restart.
 11. Wait for your MessagePad 120 to restart (about 3 seconds).
 12. Tap Extras to open the Extras Drawer.
 13. Tap the Information button ("i") near the bottom of the screen.
 14. Tap Memory info. If the software was installed correctly, the ROM version number at the middle of the screen should be 2.0 (516205)-1

If you have questions about installing the software, please see the manual that came with your MessagePad, call (800) SOS-APPL in the US, or call the Apple Support Center in your country.

IDE Hard Disk Computers: Freeze After Install System SW (8/96)

Revised: 8/22/96
Security: Everyone

IDE Hard Disk Computers: Freeze After Install System SW (8/96)

=====

Article Created: 22 August 1996

TOPIC -----

This article describes a possible issue on some IDE hard disks with ATA Driver 1.11 after installing newer system software.

DISCUSSION -----

We have seen computers with ATA Driver 1.11 on the IDE Hard Disk which may eventually cause the computer to freeze, if the computer is upgraded with a newer version of system software. Try updating the ATA Driver by using Drive Setup 1.0.4 or later.

To determine which ATA Driver your computer is using, click the hard disk icon, and choose Get Info from the File menu.

NOTE: Before installing newer system software, you should run Disk First Aid and then update the hard disk drivers.

LaserWriter 12/640 PS: Paper Weight for Duplexer (8/96)

Revised: 8/23/96
Security: Everyone

LaserWriter 12/640 PS: Paper Weight for Duplexer (8/96)

=====

Article Created: 23 August 1996

TOPIC -----

The specifications in the LaserWriter 12/640 PS User's Guide for paper weight are confusing. The User's Guide, in a section about the duplexer, mentions 16-24lb paper is supported from the cassette and 16-32lb from the manual feed slot. The page listing the specifications of the LaserWriter lists 50lb paper through the manual feed slot.

Does the LaserWriter 12/640 PS printer support a different range of paper depending on where the paper is feed from? Also, does the duplexer support irregular paper sizes if my application does?

DISCUSSION -----

The LaserWriter 12/640 PS User's Guide is a little confusing. Here are the correct specifications for paper used with this printer.

Printer from paper cassette (either 250 or 500 sheet feeder):
16lb to 28lb

Printing Duplex
16lb to 28lb

Printing from Multipurpose Try to optional Face Up Tray:
16lb to 50lb

Printing from Multipurpose Try to Face Down Tray:
16lb to 28lb

Duplexer Paper Size Support

The duplexer supports letter, legal and A4 paper sizes. These sizes are supported by the engine and LaserWriter driver software. Any other sizes will

likely cause jamming due to timeouts and handling problems.

Disk Image Files & PowerBook 190, 5300, 2300 Series (8/96)

=====

Article Created: 23 August 1996
Article Reviewed/Updated: 26 August 1996

TOPIC -----

This article describes how to use Disk Image files on the PowerBook 190, 5300, and 2300 series computers without having the Disk Copy application.

DISCUSSION -----

Disk Image files, like those found on Apple Computer's Software Update areas on the Internet and some commercial online services, can be opened with Disk Image Mounter, and copied to floppy disk using Floppy Disk Maker.

Disk Image Mounter and Floppy Disk Maker come with the PowerBook 190, 5300, and 2300 series computers. This helps customers by not requiring them to download Disk Copy from those services.

Apple MessagePad: PC Modem Cards Don't Use Audio Feedback (8/96)

Revised: 8/23/96
Security: Everyone

Apple MessagePad: PC Modem Cards Don't Use Audio Feedback (8/96)

=====

Article Created: 23 August 1996

TOPIC -----

I am using a Megahertz XJ14.4 PCMCIA fax modem card and an Apple MessagePad 120 with the Newton 2.0 OS. The modem appears to work fine, but I cannot hear the dialing tones when dialing, or when the connection is made.

The modem settings are correct and the MessagePad sound volume is set to maximum. I have seen other PC Modem cards in other Apple MessagePad devices, which had sound when the modem dialed and connected. Why is there no audible feedback with my PC Modem card?

DISCUSSION -----

Some PC fax modem cards do not provide audio feedback.

The standard PC card modems have a "speaker out" pin. This is a modulated square wave, which is the standard PC sound output. When you use the modem in a laptop computer, you are actually hearing the speaker in the laptop.

In Apple MessagePad devices, Apple uses true digitized sound, similar to the SoundBlaster card, used in most PC/Window computers. The Apple MessagePad hardware can not make use of the square wave signal, so it cannot route that signal to the Apple MessagePad speaker.

The original Newton PC modem card had a speaker in it, and it is the only PC card made with a built-in speaker.

Apple Computer has no current plans to change the Apple MessagePad design to accomodate PC Modem square wave signal.

Drive Setup: What Is The Patch Partition? (8/96)

=====

Article Created: 23 August 1996

TOPIC -----

When I formatted my hard drive with Apple's Drive Setup utility, the partition list shows something called a patch partition. What is it?

DISCUSSION -----

Drive Setup 1.0 was introduced with the Power Macintosh 9500/120 and 9500/132. These computers were the first Macintosh computers to support disk volume sizes larger than 4 GB. The "Apple_Patches" partition is required to provide this support.

Macintosh Performa 6400: Unable to Disable Fax Answering (8/96)

Revised: 8/23/96
Security: Everyone

Macintosh Performa 6400: Unable to Disable Fax Answering (8/96)

=====

Article Created: 23 August 1996

TOPIC -----

I have a Macintosh Performa 6400 series computer, and I use the included AppleFax software with the internal Global Village modem to receive faxes. When I am not expecting a fax, I have attempted to disable this feature by setting the Fax Answering feature to OFF in the AppleFax application. However, after I turned it off, the computer still attempted to answer the telephone.

I also deselected the "Auto-answer incoming calls" option in the Telephone Setup control panel, but the computer still attempted to answer the telephone.

Why does the computer continue to answer the telephone even though I have disabled all of these features? How can I stop the computer from answering the telephone when I do not want it to?

DISCUSSION -----

It appears that AppleFax is not resetting the modem after completing its tasks. Apple is aware of this and is looking into the cause.

As a workaround, you should restart the computer after disabling the Fax Answering feature in the AppleFax application. After the computer has been restarted, it will no longer attempt to answer the telephone until you enable the Fax Answering feature again.

Performa 5200: Touch Screens & Display Dimensions (8/96)

=====

Article Created: 26 August 1996

TOPIC -----

I need to adapt touch screens for use with my Macintosh Performa 5200 computers. I contacted a vendor who manufactures touch screens and they need to know the tube dimensions and the degree of curvature of the front/face of the display in order for me to use a touch screen. What are these dimensions?

DISCUSSION -----

The radius of the curvature for the display (CRT - cathode ray tube) used in the Macintosh 5200CD family* of computers is 3.94 feet. The dimensions are as follows:

Screen Height: 213.0 mm
Screen Width: 284.0 mm
Screen Diagonal: 351.0 mm

*The following computers are in the Macintosh 5200CD family: Macintosh 5200/75 LC, Performa 5200, Performa 5210, Performa 5215, and Performa 5220.

Macintosh Computers: Low Battery Can Cause No Video (8/96)

Revised: 8/26/96
Security: Everyone

Macintosh Computers: Low Battery Can Cause No Video (8/96)

=====

Article Created: 26 August 1996

TOPIC -----

I have a Macintosh 475 computer that recently stopped displaying any video. The computer appears to start up normally, but nothing appears on the monitor. What could be causing this?

DISCUSSION -----

The loss of video signal on some Macintosh computers can be caused by the lithium battery, on the logic board, having a low voltage. If you are experiencing a loss of video, you should follow these troubleshooting steps to determine the cause.

Macintosh models which can be affected: Quadra 605, Performa 475, Performa 476, LC 475, Centris 660AV, Quadra 660AV, Power Macintosh 6100, and the Performa 61XX computers.

Step 1

If possible, swap the monitor with a known-good monitor and video cable to isolate the issue to the computer.

Step 2

Reset the Parameter RAM (PRAM) by restarting the computer while holding down the Command-Option-P-R keys. Continue holding down the keys until you hear three startup chimes, then release the keys to allow the computer to boot up normally.

Step 3

If the computer still does not display video, restart the computer off a known good startup disk or CD-ROM disc. If video returns, reinstall your system

software.

If you still do not have video, your computer should be brought to an Apple authorized service provider to have the lithium battery voltage checked. If the voltage is below 3.0 volts DC, the battery should be replaced. If the battery voltage is above 3.0 volts DC, the logic board is likely the cause of the no video condition and should be replaced.

Apple Software Updates: Issues With Downloaded Files (2/97)

Article Created: 26 August 1996
Article Reviewed/Updated: 12 February 1997

TOPIC -----

I recently downloaded a system software update from Apple Software Updates. After running the installer, strange things are happening. I think the software I downloaded may be corrupted. How likely is this, and what should I do about it?

DISCUSSION -----

First, make sure you're downloading from an official Apple SW Updates location:

- * America Online - keyword: applecomputer
- * CompuServe - GO APLSUP
- * Internet -
 - Worldwide Web: <http://www.info.apple.com/swupdates>
 - ftp: <ftp://ftp.info.apple.com>

It is extremely unlikely that software updates from the Apple Software Updates are corrupted. A bad download could be detected one of several ways:

The Download Process

Most download processes involve a constant checksumming. This is a process in which the essence (a checksum) of small packets of downloaded data are generated on the sending side. Once the packet is received, a receive checksum is generated. The checksum from the sender is then compared to the receiver. If they do not match, the packet is resent.

A large number of bad packets would typically result from noisy phone lines, service provider problems (such as heavy machine loads, such as when many people are calling the same system), or software or machine issues on the caller's

side. Such downloads would either take forever, and would usually be terminated by the user; or would be terminated as the result of some other variable (such as communications loss, or a time-out due to excessive delays).

The De-binxhexing Process

Software on the Apple Software Updates is stored in Binhex format on most sites. This is a text representation of binary data. Binhex data can usually be identified by a '.hqx' appended to the file name. When a file is downloaded, it must be converted to a binary format. Binhex has its own checksums: when a download is "bad," an error message is generated.

This process has, in fact, helped recipients detect problems with the original archive as it is stored on the Apple Software Updates site: the original data may be corrupted, for example, but when it is being converted into a usable state, an error occurs. In such a case, if multiple downloads fail, the site should be independently checked, and the Apple Software Updates maintainers notified of a potential archive issue.

The Decompression Process

Most software on Apple Software Updates is compressed, and, in addition, is a self-extracting archive. This practice is used to cut down on both storage space and transmission time. The compression algorithms are rigorously defined and are completely inflexible. Any error in the data stream would tend to render the resulting application unusable.

Disk Copy

Once the final product is extracted, it may have to be converted to a useful format. For example, many files on Apple Software Updates are Disk Images. Disk images are designed for use with Apple's Disk Copy (version 4.2 or higher) utility. In the process of creating a floppy disk, checksum tags on the image file are, again, used, and errors may show up.

For further information on Disk Copy, refer to the Apple Tech Info Library article # 9384: Disk Copy 4.2: How to Install and Use (2/97)

The Installer - The Final Product

Computer software does not suffer faults well. Any corrupted data in an application's code will typically cause the microprocessor to fail when it receives either an illegal or inappropriate instruction or when an instruction refers to memory in an improper manner (this accounts for the majority of type 1, 2, 10, and 11 errors). For the installer to succeed without producing an error message is unlikely.

Discussion

From the above information, one can see that the download process involves several steps, each of which has its own checks and balances. It is highly unlikely that an installer would successfully install, yet quietly install corrupted data. A significant error would happen earlier in the process, and

would alert the user of possible issues with the software.

This is not to say that variables on the customer's side are not relevant. If the final installer is run from an external hard disk on an improperly configured (dirty) SCSI chain, random errors may occur. In addition, if the user did not disable his virus detectors or low-level performance or disk-enhancing software prior to running the installer, unusual things could happen without providing immediate feedback.

The best recommendation is to determine at what stage the failure occurs.

To reiterate, if the difficulty happens at the Binhex or uncompress stage, and the user cannot proceed, communications failures are the most likely cause of failure. If communications can be ruled out, the quality of the online archive is suspect.

If a final operational installer can be produced from the above steps, and trouble occurs, other factors are likely at hand, and normal troubleshooting should be vigorously applied: isolate the computer from any external SCSI devices, check for the presence of NuBus, PCI, or PDS cards, and vigorously scrutinize the pre-existing system software situation.

Apple Multiple Scan Display Software 2.0.2: Read Me (8/96)

Revised: 8/26/96
Security: Everyone

Apple Multiple Scan Display Software 2.0.2: Read Me (8/96)

=====

Article Created: 26 August 1996

TOPIC -----

This article contains the ReadMe file for the Apple Multiple Scan Display software 2.0.2.

DISCUSSION -----

The Display Software 2.0.2 package includes the following features:

- Display Enabler 2.0.3
- ColorSync 2.0 and ColorSync profiles
- Control Strip 1.3 with Monitor Resolution, BitDepth, and Sound Volume features
- Energy Saver 1.1

You can use this software to change the resolution of your monitor, adjust the number of colors it can display, and control your monitor's energy-saving features.

System Requirements

To use Display Software 2.0.2, you need:

- A computer with version 7.1 or later of the Mac OS software
- Any Apple Multiple Scan Display

Display Software 2.0.2 does not work with PowerBook 100 series computers or with PowerBook Duo computers other than the 280 and 280c. To use Display Software 2.0.2 with the PowerBook Duo 280 and 280c, you must connect the PowerBook to a Duo Dock.

What's New in Display Software Version 2.0.2

The Display Enabler was updated to version 2.0.3 to resolve a conflict with NOW

Utilities version 6.0.

How to Install Display Software 2.0.2

To install Display Software 2.0.2, follow these steps:

1. Insert the Display Software disk into a disk drive.
2. Double-click the Installer icon to open it. A welcome message appears.
3. Click OK.
4. Make sure the disk named in the Installer window is the disk on which you want to install the software. If not, click Switch Disk until the correct name appears.
5. Click Install to begin installation.
6. When installation is finished, follow the instructions on the screen to begin using your new software.
7. Be sure to read the file About Control Strip to learn about your new software.

Using ColorSync System Profiles

With ColorSync, different Apple monitors can display colors in a consistent way. You can also fine-tune the way your monitor displays color.

To set a ColorSync profile for your monitor, follow these steps:

1. Open the ColorSync System Profile control panel.
2. Click Set Profile.
3. In the dialog box that appears, locate the files that have the name of your monitor. Click the profile you want.

Note: If you have an Apple Multiple Scan 14 Display, you were previously instructed to use the profile for the Apple Multiple Scan 15 Display. You now have choices specifically for your monitor.

About the ColorSync choices

The ColorSync choices let you choose from several white point settings for your monitor. White point is a measure of the color content of light.

- 9300 is the standard for most computer monitors and high-definition television (HDTV).
- D50 is the standard for most graphic art work.
- D65 approximates the color of light from the midday sun.

Configuring Your Monitors

The features of the Monitors control panel have not changed. To learn more about the Monitors control panel, see the documentation or online help that came with your computer or your system software. (Some models come with a different control panel for configuring monitors.)

Tip: To set the screen resolution and configure your video card, you click the Options button in the Monitors control panel. To see more choices, hold down the Option key on your keyboard as you click the Options button.

At the bottom of the control panel, you can choose whether to change the settings when you close the control panel or when you restart your computer.

Saving Energy

Your Multiple Scan Display is designed to save energy by putting itself to sleep when you are away from the computer for a while. You can control this feature using the Energy Saver control panel.

Using the Control Strip

The Control Strip is a new way of changing certain settings from your desktop without opening control panels. With the Control Strip, you can change the number of colors on your screen, the resolution (size) of the screen, and the volume of the system sound.

To learn more about the Control Strip, read the file About Control Strip included in this package.

Troubleshooting

This section lists solutions to potential problems with your new display software.

I'm trying to change the monitor resolution, and I don't see the resolution I want.

You can see additional resolution choices in the Monitors control panel if you hold down the Option key on your keyboard while you click the Options button in the control panel. In the list that appears, click the resolution you want. (Some models come with a different control panel for configuring monitors. See the onscreen help that came with your computer.)

Note: Some of the items in this list will not work properly with your monitor. If you choose a resolution that doesn't work with your monitor, you may see a message, or your monitor may go blank or show static. After approximately 15 seconds, your monitor should revert to a usable resolution. If it does not, restart your computer.

After I change the screen resolution, a window is stuck, halfway off the screen, or missing.

Try one of the following:

- If you changed the resolution in the Monitors control panel, make sure the control panel is closed before trying to use another window.
- Quit the program whose window is missing and then open it again.
- If the program has a Windows menu, use it to hide the problem window and then show it again.
- Go back to the resolution you were using, close the window, change the resolution, and then reopen the window.
- If you have problems with a particular program, contact the publisher of that program. Not all programs take advantage of the Multiple Scan Display's new features.

If you choose the 800 x 600 (72 Hz) resolution on a Multiple Scan 14 Display, a software problem may prevent you from seeing the whole screen. Use the 60 Hz setting instead.

I install both Display Software 2.0.2 and AppleVision Software 1.0.2 and the Display Enabler version is 2.0.2 instead of 2.0.3.

If you are using both Display Software 2.0.2 and AppleVision Software 1.0.2, you must install Display Software 2.0.1 after you install AppleVision Software 1.0.2. This will ensure you get the correct version of Display Enabler.

The Mac OS splash screen and progress bar do not redraw correctly.

On some configurations, after installing Display Software 2.0.2 the Mac OS splash screen and progress bar may not redraw correctly. This will not adversely affect the performance of your Macintosh.

I installed Display Software 2.0.2 but the Sound Control Strip Module did not get installed.

If your system software uses Monitors & Sound Control Panel or Sound & Displays Control Panel, the Sound Control Strip Module will not get installed. The Sound Control Strip Module was designed to work only with the Sound Control Panel.

After I change the number of colors displayed on the screen, the colors don't look right.

Try one of the following:

- Quit the program you're running and start it again.
- Go back to the number of colors you were using.

After I change the screen resolution, icons move.

Changing the screen resolution affects how information can be displayed on your screen. The display software may automatically reposition icons after you change the screen resolution.

After I attached a new monitor to my computer, the new monitor's screen is blank or shows "garbage" or "snow."

The computer may not have recognized the monitor. Try the following: Turn off the computer and disconnect the new monitor. Start the computer with no monitor attached. Wait a minute or so for the computer to finish turning itself on. Turn off the computer again and reattach the new monitor.

My monitor does not go to sleep.

Some monitors, computers, and video cards do not support the Energy Saver feature. See the documentation that came with your monitor and video card for more information.

If you have a Power Macintosh 9500, you can get an upgrade to your software that allows your monitor to work with Energy Saver. Call the Apple Service and Support number found in the service and support information that came with your computer.

When I use both Energy Saver and a screen saver program, the screen freezes.

The screen saver program may be conflicting with Energy Saver. Turn off either the screen saver program or the Energy Saver control panel.

My monitor starts up in black and white.

If you've just installed a new video card such as the Macintosh 24AC, the monitor will start up in black and white the first time you start the computer. Switch it to color after startup.

If your Multiple Scan 15 Display is connected to a Macintosh Quadra 610, 650, 700, or 950, a Macintosh LC 475 or a Power Macintosh 6100, the monitor may start up in black and white. Switch it to color after startup.

I see two resolution options labeled 640x870 (75 Hz).

If you're using the Macintosh 24AC video card, you may see two apparently identical resolution selections. The first option sets your monitor to display millions of colors, and the second option sets your monitor to display 256 colors.

When I change resolutions, the monitor goes blank.

If your monitor is connected to the Macintosh 24AC video card, the monitor may go blank for 15 seconds when you select a resolution that does not work with your monitor. Try selecting another resolution.

The image is too small.

If you're using a Multiple Scan 1705 connected to the Macintosh 24AC video card, the image may appear too small at the resolution 1024 x 768 (60 Hz). Try a different resolution.

IMPORTANT:

Some programs and video cards do not take advantage of the Multiple Scan

Display's new features. If you experience problems with your application programs or video cards, contact the publisher or manufacturer.

Desktop Printing: Directories Created & Used (8/96)

Revised: 9/30/96
Security: Everyone

Desktop Printing: Directories Created & Used (8/96)

Article Created: 26 August 1996

TOPIC -----

What directories are used and created by Desktop Printing? It looks as if some temporary subdirectories are created that are not visible. Are these temporary directories created for each Desktop Printer icon?

DISCUSSION -----

Here is a list that summarizes how Desktop Printing uses directories:

- A directory is created for each Desktop Printer. These directories are normal HFS directories with the exception of the icon and window in the Finder, and the items stored within it.
- DTP directories show up in the sfgetfile (File-Open dialog) and sfputfile (File-Save) dialogs.
- Any non-spool files placed into these directories WILL NOT be accessible in the Finder until Desktop Printing is disabled. This is because DTP is able to tell the Finder what to show and what not to show.
- Any non-spool files placed into these directories ARE accessible through sfgetfile/sfputfile. However, Apple recommends not using these directories to store non-spool files since files will not show up in the Finder.
- If DTP is disabled, the desktop printer directories will show up with an "X" through them, though will behave exactly like a folder (subdirectory).
- Future versions of Desktop Printing will place any unrecognized files on the desktop and alert you accordingly, as well as hide these DTP directories better, even from within sfgetfile/sfputfile.

Energy Saver v2.0.1: Server Restart Option (9/96)

Revised: 9/3/96
Security: Everyone

Energy Saver v2.0.1: Server Restart Option (9/96)

Article Created: 27 August 1996
Article Reviewed/Updated: 3 September 1996

TOPIC -----

I have two Workgroup Servers, and we just had a power outage. One server automatically restarted and the other server did not. Why is that?

DISCUSSION -----

The Energy Saver control panel v2.0.1 has a Server Setting option in the Preferences menu. The "Restart automatically after a power failure." option is not selected. If this option is selected and the server still does not restart, throw out the Energy Saver Preferences in Preferences Folder and reset preferred Energy Saver options.

Macintosh Performa 6200: Using 28.8 GVC Modem (8/96)

Revised: 8/27/96
Security: Everyone

Macintosh Performa 6200: Using 28.8 GVC Modem (8/96)

=====

Article Created: 27 August 1996

TOPIC -----

Will the Global Village internal 28.8 modem which ships with the Macintosh Performa 6300 series work in a Macintosh Performa 6200 series computer? If so, what special steps are necessary?

DISCUSSION -----

Yes, the the Global Village internal 28.8 modem is compatible with the Macintosh Performa 5200, 5300, 6200, and 6300 series computers. However, the software included with the Global Village Gold IIv internal 14.4 modem is NOT compatible with the higher speed modem. You need to use update the software using the GlobalFax 2.5.6 installer.

Power Mac Format Patch: Read Me (8/96)

Revised: 8/27/96
Security: Everyone

Power Mac Format Patch: Read Me (8/96)

Article Created: 27 August 1996

TOPIC -----

This article contains the ReadMe file for the Power Mac Format Patch.

DISCUSSION -----

Important Information About the Power Mac Format Patch

=====

The Power Mac Format Patch corrects problems that may occur with initializing or erasing 3.5-inch floppy disks. You should install this patch if:

* Your computer is a Power Macintosh 8500/180, 9500/200, or 9500/180MP, and you have replaced your existing System Folder by performing a "clean" installation of system software. The new System Folder created during the "clean" installation process does not contain the patch, and needs it to function properly. (For more information about doing a "clean" installation of system software, see the manual that came with your computer.)

* You just installed a 180 megahertz (MHz) or faster PowerPC processor upgrade card in a Power Macintosh 7500, 7600, 8500, or 9500 computer.

To install the Power Mac Format Patch, you copy the patch into your Extensions folder inside your System Folder. See "Installing the Patch" below for detailed instructions.

Problems Fixed by this Patch

=====

The Power Mac Format Patch corrects the following problems that can occur while initializing or erasing a floppy disk on any Power Macintosh 7500, 7600, 8500, or 9500 computer with a 180 MHz or faster PowerPC processor.

* False warnings that your disk is defective: When initializing or erasing a floppy disk, an alert box like the one shown below usually indicates that the

disk is physically defective or damaged and should be discarded. However, the disk may actually be OK; with the patch installed, the disk may initialize or erase properly.

* Less disk space available than normal: A newly initialized floppy disk may have substantially less disk space free than what should be available. For example, a 1.4-megabyte high-density floppy disk may have only 1 megabyte of space available.

Installing the Patch

=====

To install the Power Mac Format Patch, do the following:

1. While holding down the Option key on your keyboard, drag the Power Mac Format Patch icon onto the System Folder's icon.

(If you are dragging the icon from the Apple Extras folder on your hard disk, holding down the Option key causes the icon to be copied instead of moved, which leaves a copy of the icon in the Apple Extras folder in case you need to copy it again later.)

You see the following dialog box.

2. Click OK to automatically place the patch in the Extensions folder.

3. Restart your computer by choosing Restart from the Special menu.

12 Inch PC Compat Card: Freezes With 32 MB & 64 MB DIMMs (3/97)

Revised: 3/10/97
Security: Everyone

12 Inch PC Compat Card: Freezes With 32 MB & 64 MB DIMMs (3/97)

Article Created: 27 August 1996

TOPIC -----

I have a 12 Inch PC Compatibility card installed into my PCI Macintosh. If I install either a 32 MB or 64 MB Dual Inline Memory Module (DIMM) into this card my card will lock up when it runs the HIMEM.SYS extended memory testing. Should I replace my DIMMs?

DISCUSSION -----

Issue

Apple is aware of an issue that affects the 12 Inch PC Compatibility card that may prevent certain 32 MB and 64 MB DIMMs from working properly when installed into this card. Generally the symptoms associated with this issue are as follows:

- 1) Card locks up during the HIMEM.SYS extended memory tests only after installing a 32 MB or 64 MB DIMM.
- 2) Frequent crashes while running under Windows 95 only after installing a 32 MB or 64 MB DIMM.

If your 32 MB and 64 MB DIMMs meet the memory specifications for the 12 Inch PC Compatibility card and you are experiencing either of the symptoms listed above then you probably need to update your "PC Setup" control panel.

Resolution

Use the "PC Setup DIMM patch" software to update your "PC Setup" control panel. The patch file can be found in several different locations including the "Apple Support and Information Web" (www.info.Apple.com) or one of its mirror sites, AOL, or Compuserve in the Apple Software Updates folder.

Apple Software Updates

Macintosh *f*
Unsupported *f*
"PC Setup DIMM Patch"

Follow the instructions in the "Read Me" file included with the PC Setup DIMM Patch software.

How To Tell If the Patch Has Already Been Installed

There is a way to tell if the patch(version 4.0.4) has been applied over an existing PC Setup 1.5 control panel.

Check the version number of the PC Setup 1.5 control panel by clicking on the Control Panel icon and then choosing Get Info from the File menu. The version number should say Version: 1.5, w/12" Card large DIMM patch.

Also, you cannot to patch the control panel a second time. If a second attempt is made, you will get a halt message which says,

"An unrecoverable error occurred while verifying resource vers 1 in the file PC Setup on Hard Drive. This resource needs to be patched, but its attributes aren't what was expected. Please make sure that you are patching the correct file and version."

Additional Information

Please see the following Technical Information Library articles for related 12 Inch PC Compatibility card memory and Software Update information:

"PC Compatibility Card (12-inch): Adding Memory"

"Apple ftp Sites Frequently Asked Questions"

"Where To Find Apple Software Updates" - Lists locations on online services where you can find free Apple software updates.

"Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

StyleWriter EtherTalk Adapter: Cannot Turn Off Printer (8/96)

Revised: 8/28/96
Security: Everyone

StyleWriter EtherTalk Adapter: Cannot Turn Off Printer (8/96)

=====

Article Created: 28 August 1996

TOPIC -----

I am using a StyleWriter printer with the StyleWriter EtherTalk Adapter. When the EtherTalk Adapter is connected, the StyleWriter continually cycles the power, the rollers continually spin, and the StyleWriter will not turn off.

DISCUSSION -----

The most common cause of this problem is the lack of a cartridge in the StyleWriter printer. If the adapter is connected without a cartridge in the printer, or if a print job is sent to the printer without a cartridge, the printer runs a self-test that does not complete.

To correct this problem, disconnect the power cord from the StyleWriter EtherTalk Adapter. Install a cartridge in the printer, and turn the printer off. Reconnect power to the StyleWriter EtherTalk Adapter. The printer will power up and go through a test cycle. After the self-test, you will be able to print and power off the printer properly.

System 7.5.3, Telecom 2.3.2, Quadra 840AV & Type 1 Error (8/96)

Revised: 8/28/96
Security: Everyone

System 7.5.3, Telecom 2.3.2, Quadra 840AV & Type 1 Error (8/96)

=====

Article Created: 28 August 1996

TOPIC -----

After installing System 7.5 Update 2.0 on my Macintosh Quadra 840AV with Apple Telecom 2.3.2, I now get Type 1 errors when opening Fax Terminal and Fax Viewer. This error only happens if AppleGuide 2.0.2 is active. If AppleGuide is disabled with the Extensions Manager control panel, Fax Terminal and Fax Viewer work properly. MegaPhone, however, continues to produce Type 1 errors with AppleGuide on or off.

DISCUSSION -----

The issue you describe, which occurs only on the Centris/Quadra 660AV and Quadra 840AV, has been fixed with Apple Telecom 2.3.3. You should upgrade to Apple Telecom 2.3.3. This software can be found at Apple's online software update locations.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

System 7.5.5 Update: Overview and Installation (10/96)

Revised: 11/12/96
Security: Everyone

System 7.5.5 Update: Overview and Installation (10/96)

Article Created: 19 September 1996
Article Reviewed/Updated: 4 October 1996

TOPIC -----

This article is the "Macintosh System 7.5.5 Update: Overview and Installation" Read Me file.

DISCUSSION -----

What is the System 7.5.5 Update?

The System 7.5.5 Update is a set of system software enhancements that improves the reliability and performance of all Macintosh and Mac OS-compatible computers running system software version 7.5.3. The System 7.5.5 Update also includes all of the improvements delivered with System 7.5.3 Revision 2. Therefore, it is not necessary to install System 7.5.3 Revision 2 before installing System 7.5.5 Update.

Who should install the System 7.5.5 Update?

Apple recommends that all customers who are currently using System 7.5.3 should install the System 7.5.5 Update. If you are using a system software version prior to System 7.5.3, you must upgrade to System 7.5.3 before you install this update. (If you are using System 7.5, 7.5.1, or 7.5.2, you can use System 7.5 Update 2.0 to upgrade to System 7.5.3.).

To find out what system software version your computer is using, follow these steps:

- 1) Make sure you are in the Finder. You can do this by selecting the Finder item from the application menu in the upper right corner of your desktop.
- 2) Choose About This Macintosh from the Apple menu. The system software information is in the About This Macintosh window. Make sure "System Software 7.5.3" is in the upper-right corner of the window.

What does installing the System 7.5.5 Update do?

After you install the System 7.5.5 Update, you should notice improved performance and stability, specifically:

- Significant performance improvements when using virtual memory

If you use virtual memory, this software improves the time it takes to:

- launch a large application program that requires a significant amount of RAM
- switch between large application programs
- switch between large documents within an application
- access SCSI devices

- Improved memory management on PowerPC computers

If you could not launch an application program because you did not have enough RAM to open it, you may be able to use the application after you install this update.

This update also eliminates the cause of one Type 11 error.

- Improved reliability when using floppy disks in a computer equipped with a DOS Compatibility Card

If you have a computer with a DOS compatibility card installed, you may have experienced problems inserting floppy disks while Windows is launching. This software fixes this problem.

- Improved reliability on PowerPC PowerBook computers (PowerBook 5300 and 2300 series computers) and PCI-based computers (Macintosh 5400, 6400, 7200, 7500, 7600, 8500, and 9500 series computers)

If you have a PowerPC PowerBook or a PCI-based computer, your computer may have "frozen" from time to time while accessing a hard disk. This update fixes one cause of this problem.

- Improved reliability when using Ethernet and virtual memory

If you use Ethernet and have virtual memory turned on, you may have experienced problems transferring large files over Ethernet. This update fixes this problem.

- Better reliability when using the Apple TV Tuner or Macintosh TV Remote Control

When using the remote control for the Apple Video Player, the channel and volume buttons may have stopped working when you press them rapidly. This software fixes this problem.

- Improvements in LocalTalk

This update includes improvements in LocalTalk that provide:

- better reliability on Macintosh 5400 series computers
- better performance when using some third-party infrared software products

- Improved stability when using multiple background application programs

If your computer crashed when using more than one background program, this update fixes the problem. A background program is one that works behind the

scenes, so you don't see it in the Application menu. Some e-mail programs have this background feature.

- Improved stability when using a shared printer on a network

If your computer crashed when you were trying to use a shared printer on a network, this update fixes the problem.

- Improved reliability on high performance (180MHz or greater) Macintosh and Mac OS-compatible computers that have the PowerPC 604 or 604e processors

If you have experienced system freezes during startup or difficulties when formatting floppy disks, this update fixes these problems.

- Improved reliability when using Ethernet on the Macintosh 5400 and 6400 series computers

- Improved reliability when using sound intensive applications on Macintosh Quadra and Centris computers that contain the PowerPC upgrade card

- The "System 7.5.5" extension set in Extensions Manager now includes all of the QuickTime 2.5 extensions.

With this update, you also get the following enhancements, which were available with System 7.5.3 Revision 2:

- Better reliability for PowerBooks using RAM Doubler

If you have a PowerBook using system software 7.5.3 and you use RAM Doubler (version 1.6.1 or earlier), you may have experienced a problem when waking your PowerBook from sleep. This software fixes this problem.

- Overall performance enhancements for PowerBook 2300 series and PowerBook 500 series computers with the PowerPC Upgrade Card installed

- Improved reliability when using PC-formatted floppy disks with PowerBook 500 series computers with the PowerPC Upgrade Card installed

If you have a PowerBook 500 series computer with the PowerPC Upgrade Card installed, PC-formatted floppy disks that were formatted on your computer may be unreadable in DOS or Windows computers. This software fixes this problem.

- Improved reliability on PCI-based computers and PowerBook 5300 computers, PowerBook 2300 computers, and PowerBook 500 series computers with the PowerPC Upgrade Card installed

- Improved reliability when copying files to some 1 gigabyte hard disks

If you have a PCI-based computer with a 1 gigabyte hard disk, this software helps avoid problems when copying files to the hard disk.

- Improved reliability when using the Startup Disk control panel

In rare instances, when you turn on a PCI-based Power Macintosh computer it may not start up from the disk selected in the Startup Disk control panel. This software fixes this problem.

Known problems

- Using Express Modem 3.0 (delivered by Apple Telecom 3.0) software with the System 7.5.5 Update

If you install Apple Telecom 3.0 or Express Modem 3.0 after installing the System 7.5.5 Update you will not be able to switch on your Express Modem. To fix this incompatibility, run the System 7.5.5 Update again. The System 7.5.5 Update updates your Express Modem 3.0 to Express Modem 3.0.1. (Note: Apple Telecom 3.0 shipped on some new Macintosh systems and is not presently available from Apple for download or purchase.)

- Using the volume buttons on 5200, 5300, 6200, 6300, and 630 series computers
There is a known problem that if you rapidly press the volume buttons on the front of your computer, the computer may crash. This software does not fix this problem. Apple is working on a solution to this problem.

- Using Assistant Toolbox with desktop computers

If you use the Assistant Toolbox extension (meant to be used on PowerBook computers) on a desktop computer, you will not be warned that the contents of your RAM disk will be lost when you shut down your computer. Apple is working on a solution to this problem.

- Using the Motorola Math Library and Connectix Speed Copy 1.3.1 (part of Speed Doubler) 1.3.1

There is a known incompatibility with the System 7.5.5 Update when used with two specific products at the same time: the Motorola Math Library and Connectix Speed Copy 1.3.1 (part of Speed Doubler 1.3.1). If you have both of these items in the System Folder when you use the System 7.5.5 Update, Speed Copy 1.3.1 cannot be used. In order to use Speed Copy, remove the Motorola Math Library from the Extensions folder and restart your computer.

- Programs use slightly more memory

If you are having new problems with programs reporting that they do not have enough memory, System 7.5.5 Update may require programs to use an additional 23K of memory. To fix the problem:

- 1) Quit the program if it is open.
- 2) Click the program's icon to select it.
- 3) Open the File menu and choose Get Info.
- 4) In the Info window, increase the value in the "Preferred size" box by 23.
- 5) Close the window.

- Using Energy Saver and Audio CDs on PCI-based desktop computers

On PCI-based desktop computers, Energy Saver is known to interrupt the play of Audio CDs if "Shutdown instead of sleep" is selected. This update does not fix this problem. To avoid this problem, uncheck "Shutdown instead of sleep" in the Energy Saver control panel.

- Using Desktop Shortcut feature of Aladdin DesktopTools with System 7.5.5 Update

One feature of Desktop Shortcut, a component of the Aladdin DesktopTools by Aladdin Systems, Inc. is known to fail under System 7.5.5 Update. If Shortcut is installed, when you are in an Open or Save dialog box, normally you can click in any window in the Finder. The files/folders in that window will then appear in the Standard File Dialog box's scrolling list. This feature does not work with

System 7.5.5 Update. To work around this problem, navigate using the Shortcut Menu icon. Aladdin Systems has been contacted about this problem and expects to release an update in the future to address the issue.

- Using Sagem GeoPort ISDN Adapter 1.0 with System 7.5.5 Update

There is a known incompatibility with the Sagem GeoPort ISDN Adapter 1.0 and System 7.5.5 Update, resulting in the inability to use the GeoPort ISDN Adapter. Sagem has been contacted about this problem and is working on a solution. If you have a Sagem GeoPort ISDN Adapter, you should not install the System 7.5.5 Update until Sagem resolves the conflict. For more information, visit the Sagem web site at <http://www.satusa.com> or e-mail sathelp@satusa.com.

For advanced users who need additional technical information, please see the System 7.5.5 Update Tech note. It can be located at the Apple Developer World Internet site at <http://devworld.apple.com/dev/technotes.shtml>.

Before You Install

You should use the Disk First Aid application program before you install the System 7.5.5 Update to check your hard disk for problems. Disk First Aid comes on the System 7.5.5 Update, Disk 1 disk and on the Disk Tools disk that came with your computer. Follow these steps:

- 1) Insert the System 7.5.5 Update, Disk 1 disk into the floppy disk drive and double-click its icon to open it.
- 2) Double-click the Disk First Aid icon to open it.
- 3) Click the icon for the disk you are installing software on.
- 4) Click Verify.
- 5) If Disk First Aid tells you your disk appears to be OK, choose Quit from the File menu. If Disk First Aid reports problems with your hard disk, see the manual that came with your computer.

NOTE: If you have a problem using Disk First Aid, see the manual that came with your computer.

Installing the System 7.5.5 Update

Before you install the System 7.5.5 Update, your computer must have System 7.5.3 or System 7.5.4 installed. You should also have at least 10 MB of disk space temporarily available on your hard disk. To find out what system software version your computer is using, follow the steps in "Who Should Install the System 7.5.5 Update?" above.

It is very important that you follow these steps in the order listed below to install the System 7.5.5 Update:

- 1) Open the Extensions Manager control panel.
- 2) Choose "System 7.5.3" from the Sets pop-up menu. (This choice will appear if

you are using system software version 7.5.3. If this does not appear, you need to upgrade to System 7.5.3 before installing this update.)

3) If you have third-party peripheral devices that are required for installation and that require an extension, turn those extensions back on. (Examples include video drivers, alternative input devices, network card drivers, and removable media.)

4) Restart your computer.

5) Insert the System 7.5.5 Update, Disk 1 disk into the floppy disk drive and double-click its icon to open it.

6) Double-click the Installer icon to open it.

7) After you read the licensing agreement, click Agree to continue with the installation.

8) Make sure that the destination disk indicated on the screen is the one on which you want to install system software. If the wrong disk name appears, click the Switch Disk button until the correct disk name appears.

9) Click Install.

10) Follow the instructions on the screen. On-screen messages tell you when you need to insert the other disks.

11) When the installation is complete, click Restart to restart your computer.

12) Use the Extensions Manager to turn on additional extensions (you'll need to restart your computer for the extensions to work). If you encounter problems, choose "System 7.5.5" from the Sets pop-up menu, restart your computer, then turn on other extensions one at a time to determine if one of them is incompatible.

IF YOU CANNOT INSTALL THIS UPDATE SUCCESSFULLY: If you have trouble installing this update, try choosing "All Off" from the pop-up menu in Step 2. If you are installing from a CD, turn all the extensions off, and then check the "Apple CD-ROM" extension so you can access your CD-ROM drive.

Updating a "universal" System Folder

This section describes how to update a single System Folder that can start up any Mac OS computer introduced since the Macintosh Plus. This update will allow the universal system folder to also support the 5400 and 6400 series systems.

Overview

Only some users need a universal System Folder. You might want to create a universal System Folder if you

- start up different Macintosh models using removable media or an external startup disk
- want to simplify support of multiple users by giving all users the same

System Folder

If you are responsible for only one computer, you shouldn't need to create a universal System Folder.

Instructions

- 1) You must start with a universal System 7.5.3 folder with either System 7.5 Update 2.0 or System 7.5 Version 7.5.3.
- 2) Update your universal system folder by installing System 7.5.5 Update.

Important information regarding System 7.5.4 Update

System 7.5.4 Update was released by Apple Computer to a limited distribution, prior to an anticipated general release. Shortly after this limited distribution, an issue with the software was found which required a revision. This revision was named System 7.5.5 Update. It replaces System 7.5.4 Update and will install on computers which have System 7.5.4 Update installed.

Power Macintosh: Difficulty Using Floppy Disks (9/96)

=====

Article Created: 29 August 1996
Article Reviewed/Updated: 19 September 1996

TOPIC -----

I have a Power Macintosh 8500/180 computer, and recently I have been having some difficulty using floppy disks. For example, when initializing or erasing floppy disks, an error message occurs stating that the disk is damaged. Also, some of the high-density floppy disks have only 1 MB of available space after being initialized rather than the normal 1.4 MB that should be available.

What could be causing these floppy disk errors?

DISCUSSION -----

You likely need to reinstall the Power Mac Format Patch, which corrects the problems that you are experiencing with floppy disks. The Power Mac Format Patch is required on any Power Macintosh 7500, 7600, 8500, or 9500 computer with a 180 MHz or faster PowerPC processor. This Patch is also required if you have a Mac OS-compatible PowerPC-based computer operating at 180 MHz or faster.

If these errors just started occurring, then you have probably recently performed a clean installation of system software. The new System Folder created during the "clean" installation process does not contain the patch, and needs it to function properly.

Or, you may have just installed a 180 megahertz (MHz) PowerPC processor upgrade card into your computer.

The Power Mac Format Patch is included with computers that include a 180 MHz or faster processor card. This patch is also included in System 7.5.5 Update. If you have System 7.5.5 Update installed on your computer, you do NOT need to install the Power Mac Format Patch.

To install the Power Mac Format Patch, do the following:

Step 1

While holding down the Option key on your keyboard, drag the Power Mac Format Patch icon onto the System Folder's icon.

(If you are dragging the icon from the Apple Extras folder on your hard disk, holding down the Option key causes the icon to be copied instead of moved, which leaves a copy of the icon in the Apple Extras folder in case you need to copy it again later.)

Step 2

Click OK to automatically place the patch in the Extensions folder.

Step 3

Restart your computer by choosing Restart from the Special menu.

Article Change History:

19 Sep 1996 - Added where to find this patch.

Macintosh Performa 6400: Tutorial 2 Runs in Endless Loop (8/96)

Revised: 8/29/96
Security: Everyone

Macintosh Performa 6400: Tutorial 2 Runs in Endless Loop (8/96)

=====

Article Created: 29 August 1996

TOPIC -----

I am trying to run the Tutorial Part 2 on my Macintosh Performa 6400 series computer. However, I noticed that the Tutorial appears to run in an endless loop. For example:

Step 1

Open Tutorial Part 2 from the Launcher.

Step 2

Choose the Getting Started item (#1) from the list of nine (9) menu options. The Tutorial: 1. Getting Started slide (1) appears.

Step 3

Click the right arrow. The Tutorial: 1. Getting Started slide (2) appears.

Step 4

Click the right arrow. A slide appears telling you to click Continue when the Launcher is the active window.

Step 5

Click Continue. The Tutorial: 1. Getting Started slide (2) appears again, which is the same as Step 3.

Another example is:

Step 1

Open Tutorial Part 2 from the Launcher.

Step 2

Choose the Creating a Document (#4) item from the list of (9) nine menu options. A slide appears telling you to click Continue to go to section 4.

Step 3

Click Continue. The Tutorial: 4. Creating a Document slide (1) appears.

Step 4

Click the right arrow. A slide appears telling you to click Continue when the Launcher is the active window.

Step 5

Click the Continue button. The Tutorial: 4. Creating a Document slide (1) appears again, which is the same as Step 3.

DISCUSSION -----

Apple is aware of this issue, which appears to be caused by a conflict between the Tutorial and the DateBook Pro extension. However, until the exact cause is verified, when you want to use the Tutorial Part 2, disable the DateBook Pro extension in the Extensions Manager and then restart the computer.

The DateBook Pro Extension controls the alarms for DateBook Pro. Disabling this extension will prevent any DateBook Pro alarm notifications from appearing while you are running applications besides DateBook Pro.

The DateBook Pro Extension also facilitates access to Mini DateBook Pro, which allows you to perform DateBook Pro tasks without having the application running. Thus, disabling the DateBook Pro Extension will disable access to Mini DateBook Pro.

Apple Spec Database: Read Me (9/96)

Revised: 9/27/96
Security: Everyone

Apple Spec Database: Read Me (9/96)

=====
Article Created: 30 August 1996
Article Reviewed/Updated: 27 September 1996

TOPIC -----

This article is the Apple Spec Database ReadMe file.

DISCUSSION -----

Name: Apple Spec Database

Version: 9/96

Released: September 16, 1996

Description: Apple Spec Database files contain detailed technical specifications on a variety of Apple computers, displays, and printers introduced since 1984. These specifications include information about memory configurations, power requirements, video capabilities, built-in ports, software, sound capabilities, and logic board components.

NOTE: Apple Spec Database requires FileMaker Pro version 3.0. Users who do not have FileMaker Pro 3.0 will also want to download the runtime application, "Apple Spec 9-96 app.sea".

The Read Me

Apple Spec Database files contain detailed technical specifications on a variety of Apple computers, displays, and printers introduced since 1984. These specifications include information about memory configurations, power requirements, video capabilities, built-in ports, software, sound capabilities, and logic board components.

The database was originally designed for those who had a regular need for this kind of information, such as sales and support professionals. It also became an

..TIL20347-Apple_Spec_Database-Read_Me_9-96.pdf

easy way for others to learn more about some of the products Apple has introduced over the years. The information is delivered in a cross-referenced database format for easy search and retrieval. It will look best when viewed on a monitor set to 16 or more colors.

Apple Spec Database was created in FileMaker Pro 3.0. To use the database:

Step 1

Open the self-extracting archive which contains the Apple Spec Database files to decompress them. The self-extracting archive is named "Apple Spec 9-96.sea".

Step 2

Open the file named "Apple Spec" using FileMaker Pro 3.0. If you do not have FileMaker Pro 3.0, you can use the Apple Spec Database "runtime" application.

Speech Recognition: Speakable Items Won't Run (9/96)

Revised: 9/3/96
Security: Everyone

Speech Recognition: Speakable Items Won't Run (9/96)

=====

Article Created: 3 September 1996

TOPIC -----

Whenever I attempt to use the English Speech Recognition capabilities of PlainTalk 1.4.x, an error occurs stating: "Speakable items could not run because an unexpected error occurred. Restarting your computer or reinstalling the Speech Recognition software may correct this problem."

I have attempted to resolve this error by reinstalling the Speech Recognition software, but it still occurs.

DISCUSSION -----

Several things could be causing the error message to occur. Check the following:

- * Verify that there is not a folder in the Speakable Items folder.
- * Verify that you have enough memory available
- * Verify that the following items are installed and enabled in the System Folder:
 - Speech control panel
 - Finder Scripting extension
 - AppleScript extension
 - Speech Recognition extension
 - Speech Manager extension
 - MacinTalk 3 extension
 - Speakable Items extension
- * Verify that the Voice folder is in the Extensions folder and that it contains several voice files (including "Fred")

PowerBook 2300: Amperage Comparison of Duo & Mini Dock (9/96)

Revised: 9/10/96
Security: Everyone

PowerBook 2300: Amperage Comparison of Duo & Mini Dock (9/96)

Article Created: 3 September 1996
Article Reviewed/Updated: 10 September 1996

TOPIC -----

I have noticed that the Macintosh PowerBook Duo 2300 series computers are rated at 24V and 1.5A. I found this information on its FCC ID label. I also noticed that the Apple Mini Dock is rated at 24V, but only 1.0A. Could this cause any operational difficulties or damage the Apple Mini Dock?

DISCUSSION -----

Apple engineering has stated that there is no problem running the Macintosh PowerBook (Duo) 2300 series computers with the Apple Mini Dock. The Apple Mini Dock was "over-engineered" (that is, designed to handle more power than it needs be able to handle). Therefore, it can support the 1.5 amps the Macintosh PowerBook 2300 series computers draw through it with no adverse effects.

PowerBook 500 or 5300: Freezes When Exiting HD Target Mode(9/96)

Revised: 9/3/96
Security: Everyone

PowerBook 500 or 5300: Freezes When Exiting HD Target Mode(9/96)

=====

Article Created: 3 September 1996

TOPIC -----

I have a Macintosh PowerBook 5300 series computer which "hangs/freezes" up when I shut it down after it has been functioning in HD Target Mode connected to my Macintosh Performa 6200 computer.

The PowerBook computer's hard disk drive appears on the desktop of the Performa computer and it seems to operate normally in HD Target Mode. However, when I shutdown the Performa computer, following the procedures in the PowerBook User's manual, the PowerBook hangs up. The arrows in the SCSI icon indicate activity but the PowerBook computer cannot be powered off except by the power/reset switch on the back.

Am I doing something wrong or are the directions in the PowerBook manual wrong?

DISCUSSION -----

The issue you have encountered is an operational anomaly which may occur with both the Macintosh PowerBook 500 and 5300 series computers. Also, it should be noted that this same scenario can happen when one of these PowerBook computer models is connected to ANY desktop Macintosh computer, not just the Macintosh Performa 6200 series computers.

If you follow the directions in the PowerBook user's guide, which instructs the you to power down the desktop Macintosh computer before powering down the PowerBook, the PowerBook computer may lock up. This forces you to use the power/reset switch on the back of the PowerBook computer to shut it down. This shutdown method is not advised because it may corrupt the power manager of the PowerBook computer.*

Workaround
=====

Step 1

Highlight the PowerBook computer's hard drive in the Finder on the desktop of the desktop Macintosh computer by clicking on its icon.

Step 2

Select "Put Away" (Command Y) from the File menu to unmount the PowerBook computer's hard drive. (It should disappear from the desktop.)

Step 3

Press and hold the power key (upper right corner of the keyboard) on the PowerBook computer's keyboard for approximately three seconds, then release it. This will shut down the PowerBook safely.

* For more information about resetting the power manager on Macintosh PowerBook computers please see the TIL article titled, " PowerBook: Resetting Power Manager."

PowerBook 5300: What Is The Slow SCSI Extension? (9/96)

Revised: 9/4/96
Security: Everyone

PowerBook 5300: What Is The Slow SCSI Extension? (9/96)

=====

Article Created: 3 September 1996

TOPIC-----

Several PowerBook owners I know told me that I need to install something called the Slow SCSI Extension on my PowerBook 5300. What is it? How do I know if I really need it? Where can I get it?

DISCUSSION-----

The Slow SCSI Extension is an INIT for PowerBook 5300 series computers that addresses a potential conflict with slow SCSI devices such as 1x CD-ROM drives (like the Apple CD150), Zip drives, and PowerBooks in SCSI disk mode. Not all PowerBooks will experience the problem and a PowerBook that does may not experience the problem all the time (even with different units of the same make and model).

Do I Really Need This Extension?

It is important to note that you should only install this extension if you are experiencing constant freezes or crashes when transferring files with a particular slow SCSI device.

Installing this extension will impact (slow down) performance with ALL SCSI devices by 10 to 50 percent, so you should only install it if it is absolutely needed. You can use the Extensions Manager control panel to disable Slow SCSI Extension when it is not needed .

Installation

To install Slow SCSI Extension, put it in the Extensions folder and restart your computer.

Where To Find The Software

This software is posted to the "Unsupported" section of Apple Software Updates.

It is provided "as is" and is not supported by Apple technical support.

Begin_Table

For reference, the path to the software is as follows -

Apple SW Updates

US

Macintosh

Unsupported

Slow SCSI Extension

Slow SCSI Extension.sea

End_Table

CompuServe Mail for Newton 2.0: Large E-mail Issue (4/97)

Revised: 4/21/97
Security: Everyone

CompuServe Mail for Newton 2.0: Large E-mail Issue (4/97)

=====

Article Created: 3 September 1996
Article Reviewed/Updated: 21 April 1997

TOPIC -----

When I receive a large e-mail with my MessagePad 130, the e-mail is split into 5 KB segments by CompuServe Mail Software for Newton 2.0, but a lot of the text is lost in the process. To test, I sent myself a 38 KB message and found that about 1000 bytes were missing between parts 1 and 2, and about 1500 bytes were lost between each of the other parts.

DISCUSSION -----

Based on your description, you are likely using version 1.0.1 of CISmail. Version 1.0.2 of the software remedies the situation.

There is one way to tell which version of the software you have. Look at the "text stationery". If its size is 4 kilobytes, you have version 1.0.1. If its size is 5 kilobytes, you have version 1.0.2.

CISmail 1.0.1 sometimes miscalculates the vertical size of a message displayed with a large point font. Long sections of text may become cut off because the vertical arrows will not scroll far enough to display the bottom of the message.

While using version 1.0.1 of the software, here is a workaround:

Workaround

-
- 1) Open the In Box
 - 2) Select CompuServe Prefs (from the "I" button).
 - 3) Click on mail font button.
 - 4) Choose either a 9 point, or 10 point font size.

Article Change History:
21 Apr 1997 - Updated with CIS Mail 2.0 v1.0.2 information.

Why Does The Trash Empty Automatically? (9/96)

Revised: 9/5/96
Security: Everyone

Why Does The Trash Empty Automatically? (9/96)

=====

Article Created: 5 September 1996

TOPIC -----

I have a Performa 6400/200 computer. Whenever I put anything in the Trash and Restart the computer, the trash can automatically empties itself. I have reset the Parameter RAM (PRAM) and I started up with extensions off, but it makes no difference.

I checked the "Get Info" window on Trash and it IS marked to WARN BEFORE EMPTYING. I started from the disk and ran Disk First Aid which says everything is fine.

What is wrong?

DISCUSSION -----

There is an application called At Ease that ships on Performa 6400/180 and 6400/200 computers. At Ease has a feature that will empty the trash after each user logs out or restarts/shuts down, to prevent the next user from accessing the previous user's documents.

It is possible that you may have turned on At Ease 3.0. If there is only one user assigned to At Ease (you have not created any others), then the initial login screen will not appear, so you may not realize that At Ease is running. The computer just goes ahead and selects the only user there is and proceeds. At Ease ignores the Trash's Warn Before Emptying option.

To stop the Trash from automatically emptying itself after a restart, turn off At Ease.

Article Created: 05 September 1996

TOPIC -----

This article provides the electrical specifications for Apple peripherals, including printers, monitors, scanners, drives, modems, and so on. For information about other Apple hardware, see the Tech Info Library article, "Electrical Specifications: Apple Computers (1 of 2)".

DISCUSSION -----

The following Apple products are manufactured for use in the USA. In determining whether a particular product can be used internationally, there are three classes, depending on whether a product accepts a range in voltage, frequency or both (for more specific information, see the article, "Using U.S. Apple Equipment Internationally"):

1) Universal

These products can be used internationally out of the box. Some of Apple's products are self-configuring devices or "universal" within a certain range. They can accept a range in both voltage and frequency, and only require a plug adapter for the specific locale.

Example: The Quadra 800 accepts between 100-125 and 200-240 volts, 47-63 Hz.

2) Frequency Independent

These products can be used internationally with a voltage transformer. Generally they are geared for U.S. 120 volt current, but are flexible as to the frequency they accept (for example, 47-63 Hz), and are known as "frequency independent." These products need a stepdown isolation transformer to adapt the voltage, and will handle the different frequency on their own.

Example: The U.S. Performa 200 accepts 120 volts, 47-63 Hz.

3) Frequency Dependent

These products generally cannot be used internationally. These are products that can work only within a narrow range in frequency; they are "frequency dependent." Transformers only transform voltage, so if the product requires a certain frequency, there's no practical way to convert both voltage and frequency.

These products can ONLY be used internationally in countries with the same frequency as the country for which the product was manufactured. Further, a voltage transformer will be required if the destination country has a voltage different from the home country.

Example: The U.S. Apple Color OneScanner accepts 108-132 volts, 58-62 Hz.

NOTE:

Computers with power outlets for peripherals do not condition the current as it passes through. So, for example, a monitor requiring 120v-60Hz current could not be used in a 220v-50Hz environment even if the computer from which it gets its power is able to accept the local current.

The AC output of a Macintosh II is as follows: the monitor receptacle is rated for 3 amps steady state, 40 amps peak power. The power supply is fused for 6 amps to include the Macintosh II and monitor.

The amperage on the back of the computer is what should be used to calculate load on a circuit. Typical circuits in businesses and houses are 15 Amps (some are 20, but rarer, and an electric dryer is usually 30, an electric range may have DUAL 30 Amp circuits wired together). With that capacity, you could have the following configuration (from the back of the CPU):

CPU	5 Amps
Monitor	3 Amps
LaserWriter	7 Amps
Total:	15 Amps

Most of the time, the CPU will draw only 1-1.5 Amps, the Monitor about .5-1 Amp, and the LaserWriter about 2 Amps. The difference is sometimes referred to as Nominal (high) versus Actual draw.

These following values are accurate regardless of peripherals used with each device. For example, a Macintosh II with an EtherTalk NB Card, an 8-bit video card, and HD40 SC draws a maximum of 230 watts and 6 amps from the power outlet it is plugged into.

End_Table

Additional Information

"Current leakage" is the amount of current that is passed to earth ground. The current leakage of all Apple equipment meets the following specifications:

- As specified by the UL standard for Apple equipment distributed in the United States, the current leakage will be less than 5.0 milliamperes.

- As specified by the IEC 380 & 950 standards for Apple equipment distributed in France and most of Europe, the current leakage will be less than 3.5 milliamperes.

† The PowerBook 500 series AC adapter has two separate outputs, VBatt and Vmain. The VBatt supply is used for charging the batteries while the VMain supply provides power for the PowerBook. Power from VBatt is automatically diverted to power the PowerBook if additional power is needed.

* Amps calculated based on efficiency of power supply, except for Macintosh PowerBooks (amps calculated at 7.5 volts) and Macintosh Duos (amps calculated at 24 volts).

** The BTU calculation is Watts X 3.42 = BTU/hour.

The BTU ratings for the Macintosh systems take into account any hard disk or expansion card(s) that may be installed internally.

Performa Computers: Apple Remote Access Not Installed (9/96)

=====

Article Created: 6 September 1996

TOPIC -----

I have a Macintosh Performa computer, and I'm following the instructions in the Global Village manual to set up my modem. I'm at the part which refers to setting up Apple Remote Access (ARA). The instructions say to double click the Remote Access application icon. I cannot find this application. All I can find with "ARA" on it is a file called "GV High Speed for ARA 2.0". When I double click on this, I can get an error message. What is wrong?

DISCUSSION -----

The Global Village manual also states their instructions assume that you have already installed ARA software on your computer. It also explains that the file "GV High Speed for ARA 2.0" is a modem script, not an application.

Apple Remote Access is a separate application which does not come with a Performa computer, and must be purchased separately and then installed.

AppleShare 4.2.1 Upgrade CD & Santorini Server Manager (9/96)

=====

Article Created: 6 September 1996

TOPIC -----

My AppleShare 4.2.1 Upgrade CD came with Santorini's Server Manager software, but not a serial number. Where do I get the serial number?

DISCUSSION -----

Like AppleShare on the AppleShare 4.2.1 Upgrade CD, Santorini's Server Manager software is an upgrade only. You need to use the serial number from your previous version of Server Manager software.

Apple OneScanner 600/27: TextBridge Scan Option Dimmed (9/96)

Revised: 9/6/96
Security: Everyone

Apple OneScanner 600/27: TextBridge Scan Option Dimmed (9/96)

=====

Article Created: 6 September 1996

TOPIC -----

The first time I tried to use the Apple OneScanner TextBridge software, the scanner option is dimmed. The only option available is to translate an existing scanned document. How can scan a new document?

DISCUSSION -----

First, check the hardware connections. If you can scan using the Apple OneScanner Dispatcher software, then the scanner and software are configured properly.

If the hardware operates properly, The Apple OneScanner settings and TextBridge Preferences need to be deleted, so new preferences can be built.

Step 1

Open the System Folder.

Step 2

Drag the Scanner Settings file to the Trash.

Step 3

Open the Preferences Folder.

Step 4

Drag the TextBridge Preferences file to the Trash.

Step 5

Close both the Preferences and System folders.

Step 6

Empty the Trash.

Step 7

Verify the Apple OneScanner is powered on.

Step 8

Open the Chooser and Select the "One Scanner".

Step 9

Close the Chooser.

Step 10

Launch the TextBridge software.

You should now be able to select the Scanner option.

LaserWriter 8.4: Corrupt Prefs Can Cause Errors (9/96)

=====

Article Created: 9 September 1996

TOPIC -----

I am using the LaserWriter 8.4 printer software, which worked properly when I first installed it. But, now I am getting errors stating that the paper size is wrong, or it times out, or sometimes I just get PostScript errors.

DISCUSSION -----

Many times, those errors can be caused by a corrupted preference file. Deleting the preference file can help resolve the problem. This preference files are automatically rebuilt. The preferences for LaserWriter 8.4 software are organized differently than previous versions.

There are two parts of the LaserWriter 8.4 software, the LaserWriter 8.4 Prefs file, and a Parsed PPD folder. You must remove both of the LaserWriter 8.4 Prefs file and the Parsed PPD folder.

LaserWriter 8.4 File Locations

=====

System Folder

- Preferences Folder
 - LaserWriter 8 Prefs <-- This is from previous LW software
 - Printing Prefs folder
 - LaserWriter 8.4 prefs
 - Parsed PPDs folder
 - Parsed PPDs for printers selected.
 - Watermark files for StyleWriter Printers

Removal Steps

=====

Step 1

Open the Preferences folder, inside the System folder.

Step 2

Open the Printing Prefs folder.

Step 3

Move the Parsed PPD folder to the Trash.

The Parsed PPD folder contains the PostScript Printer Description information as well as printer configuration.

Step 4

Move the LaserWriter 8.4 Prefs to the Trash.

Just removing the LaserWriter 8.4 Prefs file will usually not correct any printing trouble you are having. You must also remove the Parsed PPD folder.

LaserWriter 8.4 Notes

=====

If you already have a Desktop printer created by a previous LaserWriter version, a new Desktop printer is created when you install the LaserWriter 8.4 software.

Sound Manager 3.2.1: Minor Fixes for QuickTime 2.5 (9/96)

Revised: 9/9/96
Security: Everyone

Sound Manager 3.2.1: Minor Fixes for QuickTime 2.5 (9/96)

=====

Article Created: 9 September 1996

TOPIC -----

When I installed QuickTime 2.5, Sound Manager 3.2.1 was also installed. Sound Manager was integrated into the Mac OS, so why is there a new version of Sound Manager?

DISCUSSION -----

During the development of QuickTime 2.5, the QuickTime engineering team uncovered a few minor problems in Sound Manager 3.2 (which is integrated into System 7.5.3) that could affect QuickTime. So, a new version of Sound Manager, Sound Manager 3.2.1 was created and shipped with QuickTime 2.5.

If you are using QuickTime 2.5, you should have Sound Manager 3.2.1 installed. If you are running versions of QuickTime prior to 2.5, it shouldn't make a difference which version of Sound Manager is used since the problems only appear when QuickTime 2.5 are used.

PowerPC 603e and 604e: Performance Comparison (9/96)

Revised: 9/9/96
Security: Everyone

PowerPC 603e and 604e: Performance Comparison (9/96)

=====

Article Created: 9 September 1996

TOPIC -----

What is the performance difference between the PowerPC 603e processor and the PowerPC 604e processor used in Performa and Power Macintosh computers.

DISCUSSION -----

A PowerPC 604e processor provides 1/3 (33%) greater performance than the PowerPC 603e at the same clock speed. For example, in Macintosh computers, this suggests that the Power Macintosh 8500/180 computer will be approximately 33% faster than the Macintosh Performa 6400/180.

PowerPC 604 and 604e: Comparison (10/96)

Revised: 10/17/96
Security: Everyone

PowerPC 604 and 604e: Comparison (10/96)

Article Created: 9 September 1996
Article Reviewed/Updated: 17 October 1996

TOPIC -----

What features does the PowerPC 604e processor provide over the PowerPC 604 processor?

DISCUSSION -----

The 604e is a second version of the 604 with double the internal L1 cache sizes that total 64K (32K for the instruction cache and 32K for the data cache). The 604 has a total of 32K L1 caches (16K instruction and 16K data). Additionally, the 604e shrinks the 5.6 million transistors to 148 sq mm (from 196 sq mm). The smaller die also provides a lower power requirement and can use up to a 5:1 bus multiplier (604 has 3:1). With the 5:1 multipliers, these cards can support 250 MHz.

QuickTime 2.5: Software MPEG Available (2/97)

=====

Article Created: 9 September 1996
Article Reviewed/Updated: 26 February 1997

TOPIC -----

A few reviews of QuickTime 2.5 mention software MPEG playback is included. When I downloaded the software, I tried playing a MPEG video I downloaded, and it would not open or play.

DISCUSSION -----

QuickTime 2.5 as it shipped in August 1996, does not have the ability to decode, playback, MPEG encoded files. A separate software MPEG extension was released later that added the ability to decode MPEG files. QuickTime MPEG Extension requires a Mac OS computer with a PowerPC processor, 16MB of RAM, and QuickTime 2.5.

Article Change History:
26 Feb 1997 - Updated the status of the MPEG extension.

Workgroup Server 8550/200: Description (3/97)

Article Created: 9 September 1996
Article Reviewed/Updated: 3 March 1997

TOPIC -----

This article describes the Workgroup Server 8550/200.

DISCUSSION -----

The Workgroup Server 8550/200 is the most powerful member of the PowerPC processor-based Workgroup Server family from Apple. It delivers file and print, database, Internet, and communications capabilities that meet the needs of growing workgroups in education, business, and publishing. And it's ideal for workgroups that use both Macintosh and Windows software-based computers.

Apple Workgroup Servers are highly reliable, high-performance systems with large storage capacity that provide organizations with faster, more efficient shared network services and secure centralized storage. And the Workgroup Server 8550/200 not only meets these criteria, but also runs the familiar graphical interface of the Mac OS, making all of its capabilities incredibly easy to use.

Featuring a 200-megahertz PowerPC 604e processor with 64K on-chip cache and 512K level 2 memory cache, the Workgroup Server 8550/200 delivers all the performance benefits of state-of-the-art RISC technology. And for easy, flexible expansion, the Workgroup Server 8550/200 features three PCI slots that let you add capabilities by installing any of a variety of cards.

To make sure that network administrators can work as efficiently as possible, and that users get the most out of all that power and capacity, the Workgroup Server 8550/200 offers a choice of three software bundle solutions. The Applications Server Solution provides a variety of useful Apple and third-party software for administration, reliability, productivity, and performance. The AppleShare Server Solution includes all of the software that comes with the Applications Server, plus AppleShare file and print server software, remote administration software from Santorini, and Apple Remote Access MultiPort Server software. These two Workgroup Server 8550/200 solutions also include AppleShare

Client for Windows software, so Windows users on the network can access networked printers and files stored on a Workgroup Server running AppleShare file and print server software. The Apple Internet Server Solution comes with all the software you need to create a presence on the World Wide Web—quickly, easily, and affordably.

So if you need a high-performance server for a demanding workgroup, we have the solution—the powerful and expandable Workgroup Server 8550/200.

Features

=====

Expansion and storage

- Three PCI (Peripheral Component Interconnect) slots for expansion cards
- Internal 2GB, 7200-rpm hard disk drive, with bracket and cable for a second drive
- Internal 8x-speed CD-ROM drive
- Internal DDS-2 digital audio tape (DAT) drive (some configurations)
- Two SCSI DMA buses to support up to eight devices and transfers up to 10MB/s (internal only)
- Eight ports to support a wide range of peripherals

Networking

- Built-in Ethernet and LocalTalk capabilities
- Support for AppleTalk and TCP/IP networking protocols
- Token Ring support optional (with PCI card)

Power, speed, and memory

- 200-MHz PowerPC 604e RISC processor with floating-point processor and 64K on-chip cache on an upgradable CPU card
- 512K level 2 cache
- 32MB of RAM, expandable to 512MB

Fast, easy setup

- Comes with System 7.5.3 software installed
- Includes AppleShare 4.2.1 file and print server software (some configurations)

Compatibility

- Comes with AppleShare Client for Windows (some configurations)

Bundled software

- Includes a variety of software for administration, reliability, productivity, and performance

Service and support

- Hardware troubleshooting for the life of the server; 90 days of assistance for

Apple-branded software (phone support)

- One-year, on-site hardware warranty providing two-business-day response
- Additional service and support available

Ordering Information

=====

Workgroup Server 8550/200 (Applications Server Solution)

(32MB/2GB/CD/DAT)

Order No. M5488LL/A

- 512K level 2 cache, 1.4MB Apple

SuperDrive floppy disk drive, and mouse

- System software version 7.5.3
- Server Solutions CD and other bundled software

Workgroup Server 8550/200 (AppleShare Server Solution)

(32MB/2GB/CD/DAT)

Order No. M5489LL/A

• Identical to Order No. M5488LL/A, plus AppleShare 4.2.1, Apple Remote Access MultiPort Server software, and Server Manager from Santorini

Workgroup Server 8550/200

(32MB/2GB/CD)

Order No. M5486LL/A

- AppleShare Server Solution without a DAT drive or Retrospect Remote software

Workgroup Server 8550/200

(Internet Server Solution for the World Wide Web)

(32MB/2GB/CD)

Order No. M5487LL/A

- 512K level 2 cache, 1.4MB Apple SuperDrive floppy disk drive, and mouse
- System software version 7.5.3

• Apple Internet Server Solution CD (WebSTAR; PageMill; MacDNS; HomeDoor; NetCloak; ServerStat; RealAudio; Acrobat Pro; HyperCard; Web connectivity software for your existing EveryWare Butler SQL and FileMaker Pro databases; Navigator; BBEdit; clickable maps, e-mail, and database AppleSearch CGIs; cus-tomizable WWW pages and forms; AppleScript and scripting additions; AppleSearch; Apple RAID). Does not include Workgroup Server Solutions CD, AppleShare 4.2.1, or Server Manager.

- Includes WebMaster Macintosh by Bob LeVitus and Jeff Evans

Included with all Workgroup Servers:

- Complete setup, learning, and reference documentation
- Limited one-year hardware warranty

Macintosh Memory Expansion Kits

A variety of memory expansion kits are available. 168-pin DIMMs are required. Check with your Apple reseller for details.

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

Workgroup Server 8550/200: Technical Specifications (3/97)

Revised: 3/3/97
Security: Everyone

Workgroup Server 8550/200: Technical Specifications (3/97)

Article Created: 9 September 1996
Article Reviewed/Updated: 3 March 1997

TOPIC -----

This article lists the technical specifications for the Workgroup Server 8550/200.

DISCUSSION -----

Microprocessor
=====

- PowerPC 604e RISC processor running at 200 MHz, located on upgradable CPU card
- Integrated floating-point unit and 64K on-chip cache
- 512K level 2 cache

Memory
=====

- 32 MB of RAM, expandable to 512 MB

Storage
=====

- Internal 2 GB, 7200-rpm hard disk drive, with bracket and cable for a second drive
- One DDS-2 DAT drive—4 GB uncompressed, 14 GB compressed (some configurations)
- One 8x-speed CD-ROM drive (up to 1.2 MB/s data-transfer rate)
- One Apple SuperDrive 1.4 MB floppy disk drive that reads, writes, and formats Mac OS, Windows, MS-DOS, and OS/2 disks

Bundled software/Server Solutions CD
=====

Administrative software

- Server Manager—remote AppleShare server management tools (with AppleShare Solution only)
- FileWave—automated software and data distribution
- netOctopus—setup assessment and configuration file editing
- Adobe Acrobat Reader—viewing application for portable document format (PDF) files

Reliability software

- Apple RAID Software—data mirroring to protect against drive failures (RAID 1)
- Retrospect Remote—automated backup software (DAT configurations only)
- Virex—automated virus screening and virus check

Productivity software

- AppleShare Client for Windows—enables Windows clients to connect to an AppleShare server (some configurations)
- 4-Sight FAX—lets you send and receive faxes from your desktop
- Now Contact—provides contact management tools
- Now Up•to•Date—handles group scheduling
- Viper Instant-Access—provides a cross-platform information retrieval system

Performance software

- Apple RAID Software—optimizes performance of multiple hard disks through disk striping (RAID 0)
- Skyline/Satellite—enables monitoring of the network and server traffic over time

Note: Software bundled with the 8550/200 Apple Internet Server Solution for the World Wide Web includes Apple RAID Software and the Internet Server Solution CD.

Networking

=====

- Built-in Ethernet with 10BASE-T and AAUI
- Two serial ports for LocalTalk
- Support of TCP/IP networking software with Apple Open Transport

Displays

=====

- Supports up to 14-inch Apple displays at millions of colors; 16- and 17-inch Apple displays at up to millions of colors
- Supports most third-party displays as well as VGA and SVGA monitors

Video support

=====

- Built-in 2 MB VRAM display support

Interfaces

=====

- Three PCI expansion slots
- One Apple Desktop Bus (ADB) port for a keyboard, mouse, and other devices
- On-board Ethernet using either AAUI-15 or RJ-45
- Two DMA serial (RS-232/RS-422) ports compatible with LocalTalk
- Two SCSI DMA buses supporting up to eight SCSI devices and transfers up to 10 MB/s (internal bus only)
- 16-bit stereo sound input and output ports
- DB-15 video port for display support

Clock/calendar

=====

- Custom integrated circuit with long-life lithium battery

Disability access

=====

- System software includes CloseView and Easy Access, and can substitute visual cue for beep. Built-in solutions and third-party options provide alternative input and output solutions for people with disabilities.

Keyboard and mouse

=====

- Supports ADB keyboards with numeric keypads
- ADB Mouse II included

Electrical requirements

=====

- Line voltage: 100 to 240 V AC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 225 W maximum, not including display

ADB power requirements

=====

- Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is recommended)
- Mouse draws 10 mA; keyboard draws 25 to 80 mA (varies with keyboard model used)

Operating environment

=====

- Operating temperature: 50 degrees to 104 degrees F
(10 degrees to 40 degrees C)
- Storage temperature: -40 degrees to 116.6 degrees F
(-40 degrees to 47 degrees C)
- Relative humidity: 5 percent to 95 percent noncondensing
- Altitude: 0 to 10,000 ft. (0 to 3,048 m)

Size and weight

=====

- Height: 14 in. (35.6 cm)
- Width: 7.7 in. (19.6 cm)
- Depth: 15.75 in. (40.0 cm)
- Weight: 25 lb. (11.3 kg)—varies based on internal devices installed

Regulatory approval

=====

- FCC Class A

Macintosh Computers: Average Static Propensity Values (9/96)

Revised: 9/16/96
Security: Everyone

Macintosh Computers: Average Static Propensity Values (9/96)

=====

Article Created: 10 September 1996
Article Reviewed/Updated: 16 September 1996

TOPIC -----

A Customer is having carpet installed in their Macintosh computer lab room. The carpet company that will be installing the anti-static carpet wants to know what the average Static Propensity level Macintosh computers have as to not harm the computers in the case of static build up. Knowing this value would allow them to put in carpeting with sufficient anti-static capabilities.

Can you tell me what the average static Propensity level is for most Macintosh computers?

DISCUSSION -----

All Apple products are tested to comply with standard EC 55101-2. This ensures that Apple products are tested to withstand static electricity levels up to 15kv without permanent damage.

The level that is practical would be between 2kv to 4kv if the static is "directly" discharged to the product or 4kv to 8kv if "air" discharged (that is like a spark from your finger just before you touch something).

After researching the World Wide Web for "Static Propensity" we found that most carpet manufacturers list a level for Static Propensity in their carpet specifications. For example a specification for Mannington Commercial Carpet list the following: Static Propensity 3.0 kilovolts (kv) or Less as Tested in Accordance with AATCC-134, tested at 70 degrees Fahrenheit and 20 percent Relative Humidity. It is important to remember that static electricity increases in lower humidity environments.

While Apple cannot make a recommendation as to what static propensity level to look for when purchasing carpet, we can say that based on the static electric testing that Apple does, and the numbers specified that when looking for average values for most carpeting, it seems that 3kv would be an acceptable level.

Cyrillic Language Kit: Incorrect Keyboard Layouts (10/96)

Revised: 10/17/96
Security: Everyone

Cyrillic Language Kit: Incorrect Keyboard Layouts (10/96)

=====

Article Created: 10 September 1996

TOPIC -----

I have the Cyrillic Language Kit installed on my computer, and I think that that the keyboard layout cards (which were included with this Language Kit) may have an error on them. Instead of the typical 10 keys located between the two Shift keys, these layout cards display 11 keys. It appears that there is an extra key located between the Z key and the left Shift key. Because of this confusion, I am not sure which key the corresponding character is actually mapped to.

DISCUSSION -----

The character on this key (which varies with each layout) is actually mapped to the key to the left of the numeral 1 key in the top row of the keyboard. The keyboard layout cards incorrectly list this key as having no character mapped to it.

Apple Products: Multihoming and Multinode Support (10/96)

Revised: 10/30/96
Security: Everyone

Apple Products: Multihoming and Multinode Support (10/96)

=====

Article Created: 11 September 1996
Article Reviewed/Updated: 30 October 1996

TOPIC -----

This article contains questions about the implementation of multihoming and multinode support in Apple products. Note that this is intended to be an advanced technical article provided for informational purposes only. Apple will not provide assistance with interpreting or understanding this information.

Questions Answered in this Article:

=====

- 1) What is meant by the terms multihoming and multinode support?
- 2) Which Apple products include multihoming or multinode support?
- 3) How does the network connectivity for the DOS and Mac OS environments on the enhanced PCI-based Power Macintosh computers differ from previous Macintosh computers using DOS or PC Compatibility Cards?
- 4) If I have a PC Compatibility card installed in an enhanced Power Macintosh**, can I install an additional network adapter card for use in the DOS environment?

DISCUSSION -----

- 1) Question: What is meant by the terms multihoming and multinode support?

Answer: Multihoming is the term applied to the capability to communicate using more than one network interface (card) at a time using the same protocol. In such a situation, the different network cards can each be connected to different zones and have different addresses, but each must be using the same protocol, such as TCP/IP, AppleTalk, and so on.

Multinode support, however, is the term applied to the capability to communicate

using multiple network protocol addresses through a single network interface (with different datalink addresses) using a single protocol.

+=====+=====+=====+=====+				
	Network Interface	Hardware	Protocol	Protocols
	Cards	Addresses	Addresses	
+-----+-----+-----+-----+				
Multihoming	Multiple	Different	Different	Same
+-----+-----+-----+-----+				
Multinode	Single	Different	Different	Same
+-----+-----+-----+-----+				

2) Question: Which Apple products include multihoming or multinode support?

Answer:

Multihoming Support

* Open Transport 1.1 provides AppleTalk multihoming support to developers at the API level.

* Currently, AppleShare 4.2.1 is the only Apple product that incorporates the multihoming support functionality of Open Transport 1.1. With AppleShare 4.2.1, you can install multiple network interface cards into the server allowing users to connect to volumes and servers with the same name in different zones, allowing multiple network interfaces to be active simultaneously.

By supporting multiple network connections, multihoming support in AppleShare 4.2.1 provides additional "pipelines" to the server, which increases the amount of network traffic that can reach the server. This enables servers to support more clients, to offer greater total performance, and to increase the reliability of mission critical applications.

* The Apple Internet Router v3.0 modifies the Classic AppleTalk stack to allow multihoming. A re-write of the router is required to use the built-in AppleTalk multihoming capabilities of version 1.1 of the Open Transport/AppleTalk stack.

* The ARA Client supports AppleTalk multihoming for a single limited case: two ports only--one LAN and one serial, in both Classic and Open Transport network configurations.

Multinode Support

* The ARA Personal Server uses AppleTalk multinode capability in both the Classic and Open Transport/AppleTalk protocol stacks and is compatible with both network systems.

* The ARA Multiport Server uses AppleTalk multinode capability in both the Classic and Open Transport/AppleTalk protocol stacks and is compatible with both network systems.

* The Apple IP Gateway modifies MacTCP to allow TCP/IP multinode capability

using Classic networking. A re-write of the IP Gateway is required to use the TCP/IP built-in multihoming capabilities that are planned for future Open Transport releases. Open Transport 1.1 does not include TCP/IP multinode support.

* With the Enhanced PCI-based Power Macintosh computers**, there is specific hardware support that allows PC Compatible cards and the Mac OS environment to share the built-in Ethernet interface, allowing simultaneous network connections in both environments. Each environment uses a separate physical layer address. Depending upon the capabilities of each protocol stack being used in a given environment, multinode support may or may not be available. For example, you can connect the DOS and Macintosh environments to the same network using the same protocol (such as TCP/IP).

This configuration could also be loosely defined as multihoming because even though the Mac OS and DOS environments use the same network controller protocols, they appear as separate hardware addresses on the network. Essentially, one physical network interface appears as two.

To further describe the full capabilities of these advanced Apple systems, the implementation of a protocol stack in the Mac OS or DOS environment may itself include multinode support. For example, the TCP/IP protocol stack installed in the DOS environment may support assigning multiple IP addresses to a physical interface using the primary hardware address. Open Transport 1.1 might use an additional IP address using the secondary hardware address. In this type of configuration, a Macintosh computer with the enhanced Ethernet controller and a PC Compatibility Card can accept connection to three or more IP addresses.

3) Question: How does the network connectivity for the DOS and Mac OS environments on the enhanced PCI-based Power Macintosh computers differ from previous Macintosh computers using DOS or PC Compatibility Cards?

Answer: In other Macintosh computers that use DOS or PC Compatibility Cards, you do not have multinode or multihoming support. Instead, you only have one effective instance of an TCP/IP protocol stack. You can be connected using either the Mac OS or DOS environment, but you cannot be connected using both environments simultaneously.

4) Question: If I have a PC Compatibility card installed in an enhanced Power Macintosh**, can I install an additional network adapter card for use in the DOS environment?

Answer: No. The installed PC Compatibility Cards are hard-coded to use the built-in Ethernet interfaces. However, you can add an additional network card to provide additional network services, such as AppleTalk for the Mac OS. The Mac OS and DOS environments would then use the built-in Ethernet for TCP/IP, and the Mac OS could use the Ethernet card for AppleTalk.

Even though you are providing another network interface for the computer to use, you do not get any network performance advantage by doing this. However, this is

a viable solution if the DOS and Mac OS environments need to be physically located on different networks.

****Note:** Following are the Enhanced Power Macintosh computers:

- Power Macintosh 7200/90 (Europe ONLY)
- Power Macintosh 7200/120
- Power Macintosh 7600/120
- Power Macintosh 7600/132
- Power Macintosh 8500/132
- Power Macintosh 8500/150
- Power Macintosh 8500/180
- Power Macintosh 9500/150
- Power Macintosh 9500/180MP
- Power Macintosh 9500/200

Item Text Copied In The Finder (9/96)

Revised: 9/11/96
Security: Everyone

Item Text Copied In The Finder (9/96)

=====

Article Created: 11 September 1996

TOPIC -----

The clipboard seems to be unusually limited in its capacity to hold text when it comes to copying the contents of a Finder window.

I opened a Finder window which contained many files and select them all. I then chose the Show Clipboard command under the Edit menu and only 10 to 15 items typically appeared. I was able to reproduce this with either 680x0-based, or PowerPC-based computers running System 7.5.3.

Chalk this a clipboard peculiarity?

DISCUSSION -----

There is a 256 byte limit for item text copied in the Finder. This means the number of characters you would be able to copy from a set of items is 256 minus the number of items, and the Finder will not copy partial names. The number of items enters into it because a carriage return character (0x0D) is copied along with every item. This limit does not apply to icons.

At Ease Admin: Access Information No Longer Valid (10/96)

=====

Article Created: 12 September 1996
Article Reviewed/Updated: 30 October 1996

TOPIC -----

I have the Apple Network Administrator Toolkit (ANAT), and when I launch the At Ease Administration application, to administer our At Ease 4.0 computers, I get this error message, "User's access information is no longer valid." I keep getting this message, no matter what workstation I launch the program from. How do I fix this?

DISCUSSION -----

Below are four items to check which should resolve this issue:

- Make sure you are entering the proper name and password.
- Make sure the owner of the At Ease volume on the server has not changed.
- On the server, throw the At Ease Server preferences file in the trash. (The At Ease Server preferences file is in the preferences folder which is in the System Folder.) Then restart the server. When you launch the At Ease Administration application, you will be prompted to enter the volume name and the name and password of the owner of the At Ease volume.
- If you have mounted any volume of the server on your desktop, unmount it first before trying to open the At Ease Administration Application. If you are using At Ease Administration Application which is signed on to an active workgroup, that auto-mounts a volume from the same server using a different user name and password, you may need to quit from that workgroup.

LaserWriter 12/640 PS: Printing 2-sided Letterhead Paper (9/96)

Revised: 9/13/96
Security: Everyone

LaserWriter 12/640 PS: Printing 2-sided Letterhead Paper (9/96)

=====

Article Created: 13 September 1996

TOPIC -----

I am using letterhead stationary with a LaserWriter 12/640 PS printer. I have the duplexer installed, and sometimes need to print on both sides of the letterhead stationary. When I do, the letterhead ends up at the top of page 2 instead of page one. How can I get the letterhead on page one?

DISCUSSION -----

When printing using the Duplex Printing Unit to print on both sides of the page, the printer is designed to print in the reverse order. For example, a two page document prints page 2, then page 1. Four page documents print in the following order; page 2, page 1, page 4, then page 3.

When printing letterhead, position the paper so the letterhead is facing down and towards the back of the printer. This makes the letterhead appears on the top of the first page, instead of page two.

If you print both single-sided and double-sided documents, you can use the built-in multipurpose tray, you should use the 250-sheet cassette for single-sided paper, and the Multipurpose tray for double-sided.

LaserWriter Printers: PostScript for Configuration Page (9/96)

Revised: 9/13/96
Security: Everyone

LaserWriter Printers: PostScript for Configuration Page (9/96)

=====

Article Created: 13 September 1996

TOPIC -----

I am using a UNIX workstation to print to an Apple LaserWriter printer. Is there some way to use PostScript to generate a configuration page?

DISCUSSION -----

You can use the following PostScript code fragment to generate a LaserWriter configuration page. This only works on PostScript LaserWriter printers. Printers such as the Personal LaserWriter LS, or Personal LaserWriter SC, which use QuickDraw instead of PostScript do not work with this PostScript code fragment.

```
%=====
% Begin PostScript code
%
/SamplePages/ProcSet findresource/TestPage get cvx exec
%
% End PostScript code
%=====
```

Korean Language Kit: Read Me (10/96)

Revised: 10/17/96
Security: Everyone

Korean Language Kit: Read Me (10/96)

Article Created: 13 September 1996
Article Reviewed/Updated: 17 October 1996

TOPIC -----

This article contains the ReadMe file for the Korean Language Kit 1.0.

DISCUSSION -----

Thank you for choosing the Korean Language Kit. This document provides specific information and tips for using the Korean Language Kit, including important information on installation and compatibility

Sample Software Folder

The floppy disk set and the CD-ROM both contain the software needed to install the Korean Language Kit. The CD-ROM includes demo applications you can use with your Korean Language Kit.

Installation

* Refer to the Macintosh Korean Language Kit Installation and User's Guide for installation and setup information.

* If you are installing the Korean Language Kit on the Arabic or Hebrew version of the Mac OS, you may want to choose the left-to-right setting in the "Text" control panel for proper justification of Roman text during installation.

* Installing over a pre-System 7.5.1 system
We recommend that you use system 7.5.1 or newer for best results.

Compatible Apple WorldScript and QuickDraw GX Application Programs

Apple makes no warranties or representations regarding the quality or compatibility of third party products. Warranties, if any, relating to such third-party products are between the software vendors and their customers.

The Korean Language Kit can be used with many non-Korean application programs that use the Apple WorldScript and/or QuickDraw GX software technology. Programs that use one or both of these technologies include:

- * HyperCard, from Apple Computer, Inc.

Note: The above list is not intended to be comprehensive. Many non-Korean application that do not employ WorldScript software technology may provide limited functionality and allow input of Korean characters. Please check with application vendors for more information about their product's support for multilingual systems available on the Mac OS.

- * ClarisWorks

If you are using the Korean version of ClarisWorks 2.0 or 3.0, with the Korean Language Kit, you will need to update to a later version to achieve ompatibility. Please contact your distributor for the update.

Korean Language Kit: Specifications & Description (10/96)

Revised: 10/17/96
Security: Everyone

Korean Language Kit: Specifications & Description (10/96)

Article Created: 13 September 1996
Article Reviewed/Updated: 17 October 1996

TOPIC -----

This article contains the description and technical specifications for the Korean Language Kit 1.0.

DISCUSSION -----

Apple's Korean Language Kit is an easy, affordable way to add Korean text to your documents.

After the simple installation process, you can switch effortlessly between the computer's main language and Korean. The kit lets you enter, edit, and print Korean, and mix Korean with other languages in the same document--even in the same sentence. You can also use it to view Korean-language World Wide Web sites with the addition of Internet browsing software.

The Korean Language Kit comes with the Power Input Method, a feature-rich input method that allows conversion from hangul to hanja, can display the command menu in English or Korean, and provides an easy-to-use interface. The kit also includes two keyboard layouts for native speakers and two romaja modes for easy Korean input by non-native speakers. Also included is a set of transparent labels for customizing your keyboard.

The kit includes five QuickDraw GX-compatible TrueType fonts that produce high-quality on-screen and printed characters at many sizes. Unlike most other Korean language solutions, the Korean Language Kit offers full hanja support, including the hanja Dictionary Utility that allows a user to create a personal hanja dictionary.

The Korean Language Kit is based on Apple's WorldScript technology, which simplifies the way in which a single operating system can support multiple languages. It works with world-ready applications that take advantage of WorldScript, such as ClarisWorks 4.0, WordPerfect, Nisus Writer, and WorldWrite.

It can also be used with Korean localized applications.

This product is part of a family of Apple language solutions, which offer an affordable way to internationalize your Macintosh system. In addition to the Korean Language Kit, Apple's multilingual product offerings include the Japanese Language Kit, the Chinese Language Kit, the Chinese Dictation Kit, the Hebrew Language Kit, the Arabic Language Kit, the Cyrillic Language Kit, and others.

Features

=====

Ease of use

- * Power Input Method with support for hanja conversion
- * Simple, customizable installation process
- * Documentation in both English and Korean
- * Transparent labels for a popular Korean keyboard layout

Comprehensive, high-quality fonts

- * Five Korean fonts that include over 2,000 symbols and 4,888 hanja characters
- * Extended symbol character set and support for hiragana and katakana characters
- * Apple TrueType format for high-quality on-screen and printed characters * Full compatibility with QuickDraw GX

Versatile multilingual capabilities

- * Switch between languages easily
- * Combine Korean and other languages in the same document
- * Install as many language kits as needed on a single Macintosh system

Compatibility

- * Works with System 7.1 and all subsequent versions of the Mac OS
- * Is compatible with any localized version of the Mac OS and with other Apple Language Kits
- * Runs in native mode on Power Macintosh computers

Technical Specifications

=====

Included fonts

- * AppleMyungjo (TrueType, serif font)
- * AppleGothic (TrueType, sans-serif font)
- * Gungseoche (TrueType, calligraphy font)
- * Pilgiche (TrueType, cursive font)
- * Seoul (TrueType, system font)

Application compatibility

The Korean Language Kit is based on Apple's WorldScript technology, and is compatible with all applications that take advantage of WorldScript. These programs include:

- * ClarisWorks from Claris Corporation

- * HyperCard from Apple Computer, Inc.
- * WordPerfect from Novell, Inc.
- * Nisus Writer from Nisus Software, Inc.
- * WorldWrite from World Software Corporation
- * WinText from WinSoft S.A.
- * LightningDraw GX from Lari Software, Inc.
- * Ready, Set, Go! GX from Modular Software, Ltd.
- * Eudora from QUALCOM, Inc.

The Korean Language Kit can be used with a variety of applications localized for Korean. They include:

- * ClarisWorks K from Claris Corporation
- * Claris Organizer K from Claris Corporation
- * HyperCard K from Apple Computer, Inc.
- * Photoshop K from Adobe Systems Incorporated
- * Adobe Illustrator K from Adobe Systems Incorporated
- * PageMaker K from Adobe Systems Incorporated

Note: Apple has tested only a limited number of applications, therefore these lists are not intended to be comprehensive. Many nonlocalized applications that do not employ WorldScript software technology may provide limited functionality and allow input of Korean characters. Many Japanese localized applications will also work with the Korean Language Kit.

System requirements

- * One of the following Macintosh or other Mac OS-compatible computers:
 - An Apple Macintosh or PowerBook computer with a 68020 or later processor and 5 MB of RAM
 - A Power Macintosh computer with 8 MB of RAM
- * Macintosh System 7.1 or later
- * An Apple SuperDrive floppy disk drive or a CD-ROM drive
- * An application that supports WorldScript or has been localized for Korean

Ordering Information

=====

Korean Language Kit Order No. 400000Z

- * 1.4MB floppy disks and one CD-ROM containing:
 - Korean Language Kit
 - SimpleText Korean, a basic text-processing application
 - Demonstration versions of compatible applications and utilities
- * Transparent keyboard labels with Korean characters
- * Korean Language Kit Installing and getting started (in English and Korean)
- * Macintosh Korean Input Method Guide (in English and Korean)

Questions Answered
=====

- 1) I see odd characters that I cannot read in some of my file and folder names.
- 2) I changed my Views control panel to the Seoul font, but I still see odd characters in my Korean application program.
- 3) I changed my Views control panel to the Seoul font, and now I cannot read all my non-Korean file and folder names.
- 4) I changed my Views control panel to the Seoul font, but I still see odd characters in my Application menu.
- 5) After setting the font in the Views control panel to Seoul, I cannot edit a Korean file or folder name.
- 6) I cannot open a file in SimpleText Korean.
- 7) My Korean dates and times are not displayed correctly.
- 8) I re-installed one of my Korean application programs. Do I need to re-register it in Korean?

DISCUSSION -----

- 1) Question: I see odd characters that I cannot read in some of my file and folder names.

Answer: The font your system is using for file and folder names does not contain any Korean characters. Korean names cannot be properly displayed unless your system uses a font that contains Korean characters.

Choose Control Panels from the Apple menu and open the Views control panel. Change the font for views to Seoul.

The Seoul font contains Korean characters as well as the most commonly used Roman characters. If you are using a Roman-based primary script, you can usually view all your file and folder names correctly by setting the font for views in the Views control panel to the Seoul font. If your primary script is non-Roman (such as Japanese or Chinese), the Seoul font will not display your file and folder names correctly, and we recommend that you continue using a font from your primary script to display file and folder names.

2) Question: I changed my Views control panel to the Seoul font, but I still see odd characters in my Korean application program.

Answer: Your system may not recognize your Korean application as Korean.

Step 1

Open the Korean Language Register, which is in the Apple Extras folder on the disk where you installed the Korean Language Kit.

Step 2

Click the Register Application button.

A list of application programs appears.

Step 3

Click the application program you want to register as Korean.

Step 4

Click the Register button.

Now you can open your program and begin working in Korean.

3) Question: I changed my Views control panel to the Seoul font, and now I cannot read all my non-Korean file and folder names.

Answer: If you have file or folder names that contain non-English Roman characters, they will not be correctly displayed after you change the Views control panel to the Seoul font. The Seoul font does not contain these other characters.

In the Views control panel, choose a font that will correctly display your non-Korean file and folder names. Then use non-Korean names for all your files and folders, even those that contain Korean.

The Seoul font is only necessary to read Korean file and folder names. If you do not set the Views control panel to Seoul, you will still see Korean correctly displayed within your Korean or WorldScript-savvy application programs. You can write and print in Korean; just remember to give your files non-Korean names.

4) Question: I changed my Views control panel to the Seoul font, but I still see odd characters in my Application menu.

The Application menu cannot display Korean names, even after you set your Views control panel to the Seoul font. The names of your Korean application programs will not be correctly displayed in the Application menu and in certain dialog boxes.

The icons that appear in the Application menu next to each program's name may help you identify your Korean programs.

5) Question: After setting the font in the Views control panel to Seoul, I cannot edit a Korean file or folder name.

You may have a non-Korean keyboard selected in the Keyboards menu.

Choose the Power Input Method from the Keyboards menu.

6) Question: I cannot open a file in SimpleText Korean.

Answer: If you have more than one version of SimpleText on your computer, such as the Korean and English versions, the wrong version may start when you try to open a SimpleText Korean file.

Start SimpleText Korean, then choose Open from the File menu to open your SimpleText Korean file.

7) Question: My Korean dates and times are not displayed correctly.

If you are used to working on a Korean Macintosh, you may expect to see dates and times displayed according to the Korean format. But the Korean Language Kit does not change your whole system to Korean. Your primary system language is still the same, so your dates and times are displayed according to the original format.

8) Question: I re-installed one of my Korean application programs. Do I need to re-register it in Korean?

..TIL20387-Korean_Language_Kit-Troubleshooting_11-96_(TA35979).pdf

Answer: If the name of your program changes, you must re-register it. See instructions on registering a program in Korean.

9) Question: I have been using another Korean product on my Macintosh computer, but I cannot read the documents I created with it.

Answer: The Korean Language Kit fonts are based on the standard Korean encoding as defined by the Korean information technology standards committee. The product you have been using may be based on another character encoding; therefore the documents will not be compatible. Please check with the developer of the other Korean product.

Megaphone: Sound Input Device Already in Use (9/96)

=====

Article Created: 13 September 1996

TOPIC -----

When I attempt to open MegaPhone, an error message occurs stating that the sound input device is already in use. What causes this error message?

DISCUSSION -----

Step 1

From the Apple menu, open the Extensions Manager control panel.

Step 2

* Global Village Telport Gold IIv modems:

Verify that the the following extensions are on (checked):

- Internal Modem Sounds
- Serial Update 406
- Telephone Manager Extension

* Global Village Telport Platinum V modems:

Verify that the the following extensions are on (checked):

- Audio Volume Extension
- Processor Info Extension
- Serial Update 406
- Telephone Manager Extension

Step 3

Close the Extensions Manager window and restart your computer. MegaPhone should run correctly.

Korean Language Kit: Requirements for Installation (10/96)

Article Created: 13 September 1996
Article Reviewed/Updated: 17 October 1996

TOPIC -----

What are the system requirements for the Korean Language Kit 1.0?

DISCUSSION -----

Computer & Memory

=====

- * One of the following Macintosh or other Mac OS-compatible computers:
 - An Apple Macintosh or PowerBook computer with a 68020 or later processor and 5 MB of RAM (8 MB if you are using System 7.5 and QuickDraw GX installed).
 - A Power Macintosh computer with 8 MB of RAM (16 MB if you are using System 7.5 and QuickDraw GX installed).

System software

=====

- * Macintosh System 7.1 or later. System 7.5 is recommended.

Storage capacity

=====

- * Full installation--approximately 30 MB.
- * An Apple SuperDrive floppy disk drive or a CD-ROM drive

Other

=====

- * An application that supports WorldScript or has been localized for Korean

Control Panels: Obtaining Version Information (9/96)

Revised: 9/16/96
Security: Everyone

Control Panels: Obtaining Version Information (9/96)

Article Created: 16 September 1996

TOPIC -----

I am trying to obtain the version of the Launcher control panel. To do this, I have selected Get Info from the File menu in the Finder. However, the version is displayed as "n/a" in the Get Info window. How can I determine which version of the Launcher I have?

DISCUSSION -----

The Launcher is a control panel. When a control panel is open, its resources are in use. Since the version information is kept in a version ('vers') resource in the control panel's resource fork, the Finder is unable to access this information. This why "n/a" (not available) is displayed in the version section of the Get Info window.

If you want to obtain the version of a control panel, close the control panel and then close and re-open the folder that contains the control panel, which is typically the Control Panels folder within the System Folder.

By closing and re-opening that folder, the cached Finder information is updated. The Finder caches many resources that are displayed in Get Info window such as custom icons and 'vers' resources to increase performance.

Macintosh 5200 w/8-bit Sound: Clicks in Sound Cntrl Pnl (11/96)

Revised: 11/12/96
Security: Everyone

Macintosh 5200 w/8-bit Sound: Clicks in Sound Cntrl Pnl (11/96)

Article Created: 16 September 1996
Article Reviewed/Updated: 12 November 1996

TOPIC -----

I have a Macintosh Performa 5200 computer that included System 7.5.1. After updating to System Software 7.5.3 using System 7.5 Update 2.0, I hear clicking sounds before the Alert sound is played in the Sound control panel. This seems to occur only in the Sound control panel. What is causing these clicking sounds?

DISCUSSION -----

These clicking sounds appear to be related to the interaction between the version of Sound Manager that is installed with System 7.5 Update 2.0 and the sound chip in some Power Macintosh and Macintosh Performa 5200 series computers. The computers that may be affected have 8-bit, 22.254 sound output. To determine whether your computer has 8-bit sound follow these steps:

Step 1

Choose Control Panels from your Apple menu.

Step 2

Open the Sound control panel.

Step 3

Choose "Sound Out" from the "Alert Sounds" pull down menu. If the 16-bit sound input radio button is grayed out, you have 8-bit sound.

Step 4

Use the close box in the upper left corner to close the Sound control panel.

System 7.5.1, which was included on your computer, has Sound Manager version 3.0.2 built into it. After updating with System 7.5 Update 2.0, Sound Manager 3.2 is installed. The clicking sound occurs only on Power Macintosh and Performa 5200 series computers which have 8-bit sound and which have Sound Manager 3.2 installed.

To resolve this issue, you should install QuickTime 2.5, which installs Sound Manager 3.2.1. After upgrading the Sound Manager to 3.2.1, the clicking sound no longer occurs in the Sound control panel. QuickTime 2.5 is available on the online services.

Macintosh Performa 6400: Difficulty Connecting to AOL (9/96)

=====

Article Created: 16 September 1996

TOPIC -----

I am having difficulty connecting to America Online using the Global Village Platinum V modem that was included with my Macintosh Performa 6400 computer. Are there any special configurations that I need to set?

DISCUSSION -----

The instructions for properly setting up America Online for use with your Global Village Platinum V modem are included in the On-line Settings Read Me file which is located: Applications -> Global Village TelePort Extras -> On-line Service Settings.

Following are the steps included in that Read Me file:

Step 1

Install America Online according to the installation instructions supplied with the application.

Step 2

Copy the "GV TelePort Platinum" modem script to the Online Files folder in the America Online folder.

The America Online modem script is located in the America Online subfolder of the On-line Service Settings folder in the Global Village TelePort Extras folder (Global Village TelePort Extras:On-line Service Settings:America Online:GV TelePort Platinum).

Step 3

Launch the America Online application.

If this is the first time you are using America Online, you may need to personalize and set up the application.

Step 4

When the Welcome to America Online! screen appears, click the Setup button.

The Connection Settings dialog box appears. You will specify the settings in the First Try section of the dialog box first.

Step 5

Choose the GV TelePort Platinum modem script from the Modem Type pop-up menu.

Step 6

Click the Hardware Handshaking check box.

Step 7

Set the Connection Speed to 38,400.

Step 8

Enter your access number and dialing options (if they are not already entered).

For more information about specifying an access number and dialing options, refer to the America Online documentation.

Step 9

Repeat steps 5-8 for the Second Try section.

Step 10

Click the Save button to save your configuration.

Bundled Performa Modems: Factory Reset Commands (12/96)

Revised: 12/10/96
Security: Everyone

Bundled Performa Modems: Factory Reset Commands (12/96)

Article Created: 16 September 1996
Article Reviewed/Updated: 10 December 1996

TOPIC -----

What are the factory reset commands, default flow control settings, and initialization strings (for high-speed access) for each of the modems bundled with Macintosh Performa computers?

DISCUSSION -----

Modem	Factory Reset Command	Setting for High Speed Access	Sets Flow Control
=====	=====	=====	=====
Bronze, Bronze II	AT&F	AT&F	N/A
Gold II (external)	AT&F1*	AT&F1&K3**	CTS Only
Gold IIv	AT&F1	AT&F1	CTS Only
Platinum V	AT&F1	AT&F1	CTS Only
Platinum external	AT&F1	AT&F1	CTS Only
GeoPort Internal	AT&F	AT&F	Not applicable; bus modem.
GeoPort External	AT&F	AT&F	Not applicable; bus modem.

NOTES

* AT&F and AT&F0 is discouraged on the TelePort Gold II for Performa. If they are used, the connection light will not function properly: it may indicate a connection even if none is present. (This information is taken from page 166 of the Global Village Gold II User's Guide.)

** The AT&F1 command invokes both CTS flow control and Xon/Xoff flow control. Using the AT&F3 forces the modem to use just CTS flow control.

1) Each of the above commands (except for the Bronze) also enable V.42bis and MNP5 data compression/error correction, and enable the modem to automatically determine what the service provider is using.

2) Note that the Gold II for Performa only supports error correction and data compression with the Global Village 2.5P or later software.

3) Note that not all modems are identical. Therefore, if the above commands invoke modes which are not supported by the modem on the other side, other AT commands may need to be used to modify modem behavior. See your modem user's guide and consult with the service provider for additional information.

4) The connection dialog used should have a section to select the flow control option. If the flow control option is not the same as what the modem is configured to use, you may lose characters when receiving (or, in some cases, transmitting) data. Whenever you use hardware-based flow control, such as CTS Only, always turn off Xon/Xoff if the software provides you with such an option.

Macintosh Performa 6400: Reset Button for Modem? (10/96)

Revised: 10/17/96
Security: Everyone

Macintosh Performa 6400: Reset Button for Modem? (10/96)

=====

Article Created: 16 September 1996
Article Reviewed/Updated: 17 October 1996

TOPIC -----

The online documentation for the Macintosh Performa 6400 indicates that there is a reset button for the Global Village modem in the TelePort control panel. However, there is no TelePort control panel. How do I reset the modem?

DISCUSSION -----

Although the computer includes a Global Village modem, it has been bundled with Apple Telecom 3.0 software. The documentation refers to the Global Village software bundled with this modem on other computers.

To reset the modem, follow these steps:

Step 1

Open ClarisWorks and open a new Communications document.

Step 2

From the Settings menu, choose Connection. A dialog box appears.

Step 3

Choose Serial Tool from the Method pop-up menu, and confirm that the Modem Port icon at the bottom of the dialog is selected.

Note: The Method pop-up menu is at the top of the dialog box and by default it is normally set to Apple Mode.

Step 4

From the Sessions menu, choose Open Connection.

Step 5

Type AT and press the Return key. If an OK appears, you are ready to proceed. If not, review the steps listed above.

Step 6

Type AT&F1 and then press the Return key. You should get an OK in response.

You may wish to save the current configuration as a document by using the Save command from the File menu. If you subsequently need to issue a factory reset or otherwise test the modem with AT commands, you can open that saved document, then use Open Connection from the Sessions menu to use such commands.

Macintosh 5xxx/6xxx: Wrong Sound Capabilities Reported (9/96)

Revised: 9/16/96
Security: Everyone

Macintosh 5xxx/6xxx: Wrong Sound Capabilities Reported (9/96)

Article Created: 16 September 1996

TOPIC -----

I have a Macintosh Performa 5300 series computer, and I am attempting to use a program that requires 16-bit sound. Although I think my computer has 16-bit sound, the program is reporting that the computer is only capable of 8-bit audio. Does this computer have 16-bit sound? If so, why am I unable to use this program?

DISCUSSION -----

When System 7.5.1 is running on Power Macintosh and Performa 5200, 5300, 6200, or 6300 series computers capable of 16-bit audio input*, programs that use a Gestalt call to determine the audio input capabilities of the computer may report that the computer is only capable of 8-bit audio input. This is incorrect. The computer will correctly record 16-bit audio data unless the program disables 16-bit sound recording based on the incorrect report from the computer.

This is resolved in System 7.5.3. You can upgrade from System 7.5.1 to System 7.5.3 by installing System 7.5 Update 2.0 (available on the Internet and online services) or by installing System 7.5 version 7.5.3 (available for purchase).

* Note: All Power Macintosh and Performa 5300, 6200, and 6300 series computers support 16-bit audio input. Some Macintosh 5200 series computers support 16-bit audio and some do not. The following models only support 8-bit audio input:

Order no.	Product Name	Sound
M3947LL/A	Power Macintosh 5200 LC 8/500/CD	8-bit
M3917LL/A	Power Macintosh 5200 LC 8/500/CD/VI/TV	8-bit
M3947LL/B	Power Macintosh 5200 LC 8/500/4XCD	8-bit
M3940LL/A	Macintosh Performa 5200CD 8/500	8-bit
M3941LL/A	Macintosh Performa 5200CD 8/500/TV/VI	8-bit

If your computer is not listed and you would like to verify whether your computer has 8-bit or 16-bit sound, follow these steps:

Step 1

Choose Control Panels from your Apple menu.

Step 2

Open the Sound control panel.

Step 3

Choose "Sound Out" from the "Alert Sounds" pull down menu. If the 16-bit sound input radio button is grayed out, you only have 8-bit input.

If 16-bit is not grayed out, make sure there is a dot in the radio button next to it.

Step 4

Use the close box in the upper left corner to close the Sound control panel.

At Ease 3.0.x, Restricted Finder, and Installer Issue (9/96)

Revised: 9/17/96
Security: Everyone

At Ease 3.0.x, Restricted Finder, and Installer Issue (9/96)

=====

Article Created: 17 September 1996

TOPIC -----

I'm using At Ease 3.0.1 on the workstations in my workgroup, and I have set the users to have a Restricted Finder. I have deselected items users are not allowed to access on a CD-ROM disc, however, users are able to access these deselected items, like an application installer. What am I doing wrong?

DISCUSSION -----

This issue happens with all versions of At Ease for Workgroups 3.0, including the latest version 3.0.2. The Restricted Finder, in At Ease for Workgroups 3.0.x, does not handle removable media properly. In fact, when a user goes into the Settings... option, to specify which files can or cannot be seen on a particular CD, the instructions at the top of the window states, these settings are for the Panels. Below that it says, everything will be visible in the Finder. What is not specifically stated is, what is true for the Finder is also true for the Restricted Finder.

This issue has been resolved in At Ease 4.0 which is part of the Apple Network Administrator Toolkit. The feature works properly both in Panels and Restricted Finder.

You should do one of the following:

- Not use the Restricted Finder with At Ease 3.0.x version
- Upgrade to At Ease 4.0 if you need this control in the Restricted Finder

Performa 6400: Installing Macintosh Tutorial Part II (9/96)

=====

Article Created: 17 September 1996

TOPIC -----

How can I reinstall the Macintosh Tutorial Part II on my Macintosh Performa 6400 series computer?

DISCUSSION -----

Macintosh Tutorial Part II is available on the Macintosh Performa 6400 Guided Tour CD-ROM disc. Follow these steps to reinstall it:

Step 1

Open the Macintosh Performa 6400 Series Guided Tour CD-ROM disc.

Step 2

Locate and open the Hard Disk Files folder.

Step 3

Locate and open the System Folder Files folder.

Step 4

Locate and open the Extensions folder.

Step 5

Locate the file, Macintosh Tutorial Part II, and drag it to the Extensions folder located in your System Folder on your hard drive.

Network Server 500 or 700: Creating a Logical Volume (10/96)

Revised: 10/21/96
Security: Everyone

Network Server 500 or 700: Creating a Logical Volume (10/96)

=====

Article Created: 17 September 1996
Article Reviewed/Updated: 21 October 1996

TOPIC -----

How do I create a Logical Volume on my Apple Network Server 500 or 700 running AIX?

DISCUSSION -----

There are four methods for adding a logical volume to the Network Server: command line, SMIT, visual Storage Manager, or the AppleTalk Disk Management Utility. Also, a logical volume will be created when a file system is created not using an existing logical volume. A logical volume is made up of a number of logical partitions. There are various options available when creating a logical volume, from as simple as just specifying size, to specifying mirror or stripe, to specifying the exact physical volume and physical partition mapping.

- Command line: Command line options are not recommended for novice users unfamiliar with Unix commands; for more information see `mklv` and `chlv`. Below is an example of how to create a logical volume on the root volume group with a name of `workvg` and having a size of 12 logical partitions:

```
mklv -y'workvg' rootvg 12
```

- SMIT: This is the recommended method for Unix novices, enter `'smit mklv'`, then enter or select the volume group where the logical volume will be created. The only required field is for the number of logical partitions that will be used to create the logical volume. Additional fields can be completed to customize the logical volume.

- Visual Storage Manager: Open the Volume Manager from the Application Manager - System_Admin on the tool bar or execute the `'/usr/bin/X11/xlvm'` command. Select the logical volume template type and drag the appropriate logical volume template using the middle mouse button to a volume group or in a logical volume pane expanded from a volume group.

- AppleTalk Disk Management Utility, AppleTalk and ppcd services must be configured on the server. Launch the Disk Management Utility on a Macintosh and connect to the server as root. Select a volume group and select the 'New File System...' command under the Configuration menu. Set the size and type of logical volume or file system.

Useful Commands

The 'lsvg' command can be used to gather information about a volume group and the physical volumes in a volume group.

lsvg	:lists all volume groups
lsvg -p <volume group>	:lists physical volumes in a volume group
lsvg -n <physical volume>	:lists information about the volume group, such as size, free space, and physical partition size
lsvg -M <volume group>	:lists allocation of each physical partition in a volume group
lsvg -l <volume group>	:lists each logical volume in a volume group and some of the logical volume characteristics

For more information see Info Explorer

-
- Topics & Task Index, Managing Physical and Logical Storage, Logical Volumes

System 7.5.5 Update: Frequently Asked Questions (2/97)

Revised: 2/7/97
Security: Everyone

System 7.5.5 Update: Frequently Asked Questions (2/97)

=====

Article Created: 18 September 1996
Article Reviewed/Updated: 7 February 1997

TOPIC -----

This article contains the answers to frequently asked questions (FAQ) about System 7.5.5 Update.

Questions in this FAQ

- 1) What is System 7.5.5 Update?
- 2) Who should install System 7.5.5 Update?
- 3) Should I install System 7.5.5 Update if I do not have System 7.5.3?
- 4) What improvements does System 7.5.5 Update deliver?
- 5) Why can't I see performance improvements when I run MacBench with the new Virtual Memory?
- 6) I sometimes have problems playing Audio CDs with Energy Saver installed. Does the updated Energy Saver control panel fix this?
- 7) The "About System 7.5.5 Update" document says that I may have to increase the preferred memory size of some applications by 23K. Why?
- 8) What is different about this new math library?
- 9) What tips are there to ensure I have a more trouble-free installation of System 7.5.5 Update?
- 10) Can I install the U.S. version of System 7.5.5 Update on a system which has a non-U.S. version of the system software?
- 11) Why is there no "custom install" and "custom remove" option for the installer?
- 12) The installer says "optimizing system for speed" during the installation. What does this mean?
- 13) When will System 7.5.5 Update be available in other languages beside U.S. English?
- 14) If I have any system running System 7.5.3, will I have all of the latest system software improvements after installing System 7.5.5 Update?
- 15) How can I tell if my system has been updated with System 7.5.5 Update?
- 16) How can I tell if a product which I purchased from Apple has the

enhancements provided by System 7.5.5?

- 17) Along with the announcement of System 7.5.5 Update, it has been stated that this is the last system software release for the Macintosh Plus, SE, Classic, Portable, PowerBook 100, SE FDHD, SE/30, LC, II, IIX, and IICX systems. Why are future versions of the Macintosh system software not supporting these systems?
- 18) If I have installed MODE32 on a Macintosh II, IIX, IICX, or SE/30, does this mean my system will be supported by future releases of the Macintosh system software?
- 19) Are there any known problems with installing this update which I should be aware of?
- 20) What happened to System 7.5.4?
- 21) Where can I get System 7.5.5 Update?
- 22) What are the system requirements for System 7.5.5 Update?
- 23) Where can I get more information about the Mac OS?

DISCUSSION -----

- 1) Question: What is System 7.5.5 Update?

Answer: This is a three-disk set of system software enhancements that delivers improvements in stability and performance improvements for Macintosh and Mac OS-compatible computers. This important update is for all Macintosh and Mac OS-compatible computers running System 7.5.3, and will update a system to System 7.5.5.

- 2) Question: Who should install System 7.5.5 Update?

Answer: Apple is recommending that any Macintosh or Mac OS-compatible computer with System 7.5.3 install this update.

IMPORTANT: System 7.5.5 Update will not install on PowerBook 1400 computers. The System 7.5.5 Software Installer will not let the upgrade take place. However, PowerBook 1400 owners can install Mac OS 7.6.

- 3) Question: Should I install System 7.5.5 Update if I do not have System 7.5.3?

Answer: You must have System 7.5.3 in order to install this software. You can tell if you are currently using System 7.5.3 on your system by choosing "About This Macintosh" from the Apple menu. In the top right-hand side of this window will be the system software information. Your system has System 7.5.3 installed if it reads:

System Software 7.5.3

If you have System 7.5, 7.5.1, or 7.5.2, you can update to System 7.5.3 by obtaining System 7.5 Update 2.0. If you have a version earlier than System 7.5, you will need to purchase it from an Apple reseller, or by calling the Apple Order Center. In the U.S. call 800-293-6617.

4) Question: What improvements does System 7.5.5 Update deliver?

Answer: System 7.5.5 Update provides reliability improvements for all systems by eliminating some causes of system freezes and improves the reliability of sharing a printer over the network. In addition, there are a number of improvements which only affect certain models, including:

- More reliable use of the floppy drive on DOS-compatible systems
- Improved floppy formatting and better reliability during system startup for high performance (180MHz or higher) 604 or 604e microprocessor-based systems
- Improvements in the reliability of the remote control included with the Apple TV tuner and Macintosh TV
- The elimination of a cause of Type 11 errors on PowerPC-based systems
- More trouble-free networking with the 5400 and 6400 series systems
- Improvements in data integrity when accessing a 5400 series system over the network
- More reliable use of sound-intensive applications for Macintosh Quadra and Centris systems which have been updated with the Apple Power Macintosh Upgrade Card.
- A revised Energy Saver control panel which removes references to the EnergyStar program.

The performance improvements provided in System 7.5.5 Update are primarily for people who use Virtual Memory (VM). The VM offered in System 7.5.5 Update will deliver significantly better performance when performing specific tasks than the VM provided in earlier versions of the system software. Areas where you may see performance include launching large applications, switching between large applications, switching between large documents in applications, and accessing SCSI devices. However this improvement will vary greatly depending on the amount of RAM installed in the system, the amount of virtual memory allocated, and the applications being used. A revised Code Fragment Manager enables some large PowerPC-native applications to launch faster, while enabling some applications to be launched in low-memory situations. The Universal System Folder, which let customers with System 7.5.3 create a single system folder on an external hard disk or removable-media drive and use it to boot up everything from Macintosh Plus to a Power Macintosh 9500, has been enhanced to support the latest Apple computers, including the Apple Macintosh 5400 and 6400 series.

5) Question: Why can't I see performance improvements when I run MacBench with the new Virtual Memory?

Answer: The performance measurements made in MacBench do not measure the particular type of performance improvements delivered with System 7.5.5 Update. Other benchmarking programs also may not measure these particular performance improvements.

6) Question: I sometimes have problems playing Audio CDs with Energy Saver installed. Does the updated Energy Saver control panel fix this?

Answer: On some occasions when playing an Audio CD on a Macintosh with Energy Saver installed, the CD will play for a while and then stop, resetting to track 1 and time 0:00. This problem is caused by the Energy Saver control panel and will be fixed in a future system update. This can affect all PCI-based Power Macintosh computers. The problem can be avoided by opening the Energy Saver control panel, deselecting "Shutdown instead of Sleep", and then closing the Energy Saver control panel.

7) Question: The "About System 7.5.5 Update" document says that I may have to increase the preferred memory size of some applications by 23K. Why?

Answer: System 7.5.5 Update includes a new library of mathematical routines. Certain applications which use this library may require 23K additional memory in order to run. You do not need to change the preferred memory size of every application you use. Only change the preferred memory size for applications which report an insufficient memory message when you try to launch them.

8) Question: What is different about this new math library?

Answer: This library includes more efficient routines for calculating certain mathematical functions. You may see a slight performance increase when using applications that use these improved mathematical routines.

9) Question: What tips are there to ensure I have a more trouble-free installation of System 7.5.5 Update?

Answer: It is very important to read the "About System 7.5.5 Update" document which comes with the update, and follow the directions on installing System 7.5.5 Update.

In general, it is best to not to rename or move files around within your System Folder. The System 7.5.5 Update Installer makes some assumptions that certain files will be in certain places, and if these files are moved or renamed, files that System 7.5.5 Update installs could be placed in the wrong place, or not installed at all.

10) Question: Can I install the U.S. version of System 7.5.5 Update on a system which has a non-U.S. version of the system software?

Answer: No.

11) Question: Why is there no "custom install" and "custom remove" option for the installer?

Answer: System 7.5.5 Update only updates the existing installed components on your computer. It does not add functionality. These updates are necessary to ensure your computer is operating optimally based on your installed configuration. A custom install option is only available when an installation

provides new features that you may not wish to install, such as those found in System 7.5.3. Because System 7.5.5 Update adds no new features to your computer, the custom install and custom remove options are not provided.

12) Question: The installer says "optimizing system for speed" during the installation. What does this mean?

Answer: Some resources installed in your System file by System 7.5.5 Update are compressed. The installer expands these resources to increase system performance.

13) Question: When will System 7.5.5 Update be available in other languages beside U.S. English?

Answer: Apple expects localized versions of System 7.5.5 Update to be available in many countries within 90 days after the U.S. introduction. Please contact your local Apple support center for local availability.

14) Question: If I have any system running System 7.5.3, will I have all of the latest system software improvements after installing System 7.5.5 Update?

Answer: Yes.

15) Question: How can I tell if my system has been updated with System 7.5.5 Update?

Answer: If you have installed System 7.5.5 Update on to your system, there is a very easy way to verify that it has been installed. Choose "About This Macintosh" from the Apple menu. In the top right-hand side of this window will be the system software information. Your system has System 7.5.5 Update installed if it reads:

System Software 7.5.5

16) Question: How can I tell if a product which I purchased from Apple has the enhancements provided by System 7.5.5?

Answer: If you purchased a system from Apple which has the System 7.5..4 Update enhancements already included, the "About This Macintosh" window will read:

System Software 7.5.5

17) Question: Along with the announcement of System 7.5.5 Update, it has been stated that this is the last system software release for the Macintosh Plus, SE, Classic, Portable, PowerBook 100, SE FDHD, SE/30, LC, II, IIX, and IICX systems. Why are future versions of the Macintosh system software not supporting these systems?

Answer: Future Mac OS releases will require a 68030, 63040, or PowerPC-based system which support 32-bit memory addressing, this includes all other Macintosh models. However, while future system software releases will not install on these older systems, Apple will still fully support customers with these systems by providing telephone assistance.

18) Question: If I have installed MODE32 on a Macintosh II, IIx, IICx, or SE/30, does this mean my system will be supported by future releases of the Macintosh system software?

Answer: No. System 7.5.5 Update is the last release which will support these hardware systems, regardless if MODE32 is installed.

19) Question: Are there any known problems with installing this update which I should be aware of?

Answer: Customers are encouraged to read the document which accompanies the update, titled "About System 7.5.5 Update". It has a "known problems section" which documents issues which Apple wants to make sure are brought to our customers' attention.

20) Question: What happened to System 7.5.4?

Answer: System 7.5.4 Update, which delivers System 7.5.4, was released by Apple Computer to a limited distribution, prior to an anticipated general release. Shortly after this limited distribution, a bug in the software was found which required a revision. This revision was named System 7.5.5 and replaces System 7.5.4. System 7.5.5 Update will install on computers which have System 7.5.4 installed.

Since System 7.5.4 was released to a limited audience, there needs to be a way to easily identify this release in the event one of our customers installed it and are having specific problems. In order to make identification of 7.5.4 easy, the version number was incremented to System 7.5.5.

21) Question: Where can I get System 7.5.5 Update?

Answer: System 7.5.5 Update is available electronically via:

- Apple ftp and World Wide Web sites
 - [ftp.info.apple.com](ftp://ftp.info.apple.com)
 - <http://www.info.apple.com>
- Most on-line services, including America Online, CompuServe, and AppleLink.

In the U.S. customers also may order the update on three floppies for \$13 by calling 1-800-293-6617, ext. 1322. Outside the U.S. contact your local Apple support center for further information.

22) Question: What are the system requirements for System 7.5.5 Update?

Answer: In order to install the update, you must have System 7.5.3. System 7.5.5 Update cannot be installed on earlier versions of System 7.5.

23) Question: Where can I get more information about the Mac OS?

Answer: More information can be obtained about the Mac OS on the Internet at:
<http://www.macos.apple.com/macos/siteindex.html>

AICK and Previously Installed Netscape Navigator (9/96)

Revised: 9/18/96
Security: Everyone

AICK and Previously Installed Netscape Navigator (9/96)

=====

Article Created: 18 September 1996

TOPIC -----

I just installed the Apple Internet Connection Kit (AICK) on my Macintosh which is connected to a local area network (LAN). Netscape was already installed and was working correctly. However, after installing AICK I get this message when I launch Netscape, "There is an error in the PPP preferences file." I removed the PPP preference and Netscape preference files and I still get this message, what is wrong?

DISCUSSION -----

The TCP/IP or MacTCP control panel has become configured for a PPP connection. You need to switch it to either a EtherTalk, Ethernet, or LocalTalk connection as is appropriate.

ARA MultiPort Server 2.1 and Serial PCI Card Issue (9/96)

Revised: 9/18/96
Security: Everyone

ARA MultiPort Server 2.1 and Serial PCI Card Issue (9/96)

=====

Article Created: 18 September 1996

TOPIC -----

I received Apple Remote Access MultiPort (ARA MP) Server 2.1 with my Workgroup Server, but I cannot get ARA to recognize the Serial PCI card I purchased separately for the computer. Why will this not work?

DISCUSSION -----

The ARA MP Server v2.1 that ships with the Workgroup Server 7250 and 8550 works only with the built-in enabler on those computers. Only ARA MP Server v2.1.1 supports PCI cards. There is no upgrade from the bundled version (2.1) of ARA MP Server to 2.1.1. If you wish to use ARA MP Server with a PCI card, you should purchase version 2.1.1.

ClarisWorks 4.0-4.0v4: 32 MB RAM Causes Crash (9/96)

Revised: 9/18/96
Security: Everyone

ClarisWorks 4.0-4.0v4: 32 MB RAM Causes Crash (9/96)

Article Created: 18 September 1996

TOPIC -----

I have ClarisWorks installed on my Macintosh computer (v4.0). I just upgraded my computer's memory to 32 MB. Since this upgrade, I no longer have to use Virtual Memory, but my computer crashes a lot in ClarisWorks. Do you have any idea what is wrong?

DISCUSSION -----

Issue

If you 32 MB or more of *physical* RAM (not Virtual Memory) installed in your computer, ClarisWorks 4.0 (all versions including 4.0v4) will randomly crash when the you click on the close box to close a ClarisWorks document. Additionally, this problem will sometimes manifest itself when you select Save or Save As from the File menu.

Workaround

There are two workarounds. One workaround is to open SimpleText and keep it open in the background while you work in ClarisWorks. The second workaround is to open another application and increase its memory partition to about 10,000K to reduce the amount of free RAM.

Resolution

Claris Technical Support has confirmed the issue and the workarounds. Claris plans to address this issue in the next release of ClarisWorks.

NOTE:

Apple Ethernet Card: Requires Network SW Installation (9/96)

Revised: 9/30/96
Security: Everyone

Apple Ethernet Card: Requires Network SW Installation (9/96)

=====

Article Created: 18 September 1996
Article Reviewed/Updated: 30 September 1996

TOPIC -----

I work for a school district that has several Power Macintosh 5260/100 computers. We had an Apple Ethernet Comm Slot card installed in each of the computers. However, I cannot get any of them to switch over to EtherTalk using the Network control panel.

DISCUSSION -----

Once the Apple Ethernet Comm Slot cards are installed, you must install the networking software. You can install the network software by using the Network Software Installer (NSI) 1.5.1 or later disk which came with the Ethernet Comm Slot card. If you cannot locate the NSI installer disk, you can install the network software by performing a Custom Install of the Networking software from the System Software CD-ROM disc.

Once the networking software is installed, you can use EtherTalk by selecting EtherTalk in the Network control panel, or AppleTalk control panel if Open Transport is being used.

Article Change History:
30 Sep 1996 - Added NSI to install network software.

Power Macintosh 5260/120: Description (10/96)

Revised: 1/9/97
Security: Everyone

Power Macintosh 5260/120: Description (10/96)

Article Created: 19 September 1996
Article Reviewed/Updated: 9 January 1997

TOPIC -----

This article contains the description for the Power Macintosh 5260/120 computer.

DISCUSSION -----

The Power Macintosh 5260/120 computer brings 120-megahertz PowerPC processor performance to a new low cost. And this is a system that can grow as your needs change, with such options as 256K of Level 2 cache memory to further boost processor performance, and a wide variety of multimedia, networking, and communications expansion cards.

The Power Macintosh 5260/120 is an all-in-one system, so it's economical, easy to set up, and easy to start using. And it's optimized for multimedia, with built-in features and expansion slots that let you enjoy stunning graphics, video, and audio now--and add advanced features later.

Already included in the main unit are a 14-inch color display (diagonal viewable image size 12.3 inches), a 1.2-gigabyte hard disk, a 1.4-mega-byte floppy disk drive, an 8x-speed CD-ROM drive, a microphone, and stereo speakers. The whole system is on a tilt-and-swivel base that lets you position it precisely for the most comfortable viewing. A keyboard and mouse are also provided, as are more than a dozen home, education, and home-business programs, and a collection of multimedia reference CDs.

The 16-bit sound provides high-quality audio playback through the built-in stereo speakers or external speakers (not included). You can record voice, music, and other audio of your own choosing through the front microphone or the rear audio-input port.

Multimedia expansion is easy on the Performa 5260/120 computer. Your computer comes with special slots for video-input, TV tuner, and communications or

..TIL20413-Power_Macintosh_5260-120-Description_10-96_(TA36006).pdf

networking cards. A general-purpose slot supports a variety of expansion options, such as an MPEG card for viewing CD-ROM-based movies and interactive "edutainment" programs. You can also add video-output capability to display your Macintosh screen on a TV or a projection system, or to record your work on a VCR.

Features

=====

Complete, ready-to-use system

- * Computer, 14-inch color display (12.3-inch diagonal viewable image size), 8x-speed CD-ROM drive, floppy disk drive, hard disk, microphone, and speakers built into one unit
- * Matching keyboard, mouse, and all necessary cables
- * Apple System 7.5 software, including Apple Guide software for step-by-step help with basic system operation, and QuickTime multimedia software
- * Built-in 8x-speed CD-ROM drive
- * Front-panel volume control and headphone/speaker jack
- * CD-quality digital sound

Ordering Information

=====

Power Macintosh 5260/120

Power Macintosh 5260/120 Computer with built-in 14-inch display (12.3-inch diagonal viewable image size), 1.2GB hard disk, 8x-speed CD-ROM drive, and Apple SuperDrive floppy disk drive. Mouse, keyboard, and cables also included.

Check with your Apple reseller for specific configuration information and ordering numbers.

Optional Enhancements

* High Performance Module
(256K level 2 cache)
Order No. M4849LL/A

* Apple MPEG Media System
Order No. M4243LL/A

* Apple Video System
Order No. M2894LL/C

* Apple TV/FM Radio System
Order No. M4586LL/A

* Apple TV/Video System

Power Macintosh 5260/120: Specifications (10/96)

Revised: 10/31/96
Security: Everyone

Power Macintosh 5260/120: Specifications (10/96)

Article Created: 18 September 1996
Article Reviewed/Updated: 31 October 1996

TOPIC -----

This article contains the technical specifications for the Power Macintosh 5260/120.

DISCUSSION -----

Microprocessor

=====

- * PowerPC 603e processor running at 120 MHz
- * 32K internal cache
- * Integrated floating-point unit
- * 40-MHz, 64-bit bus
- * Optional 256K level 2 cache

Memory

=====

- * Comes with 16 MB of RAM
- * Can be expanded to 64 MB
- * Uses 72-pin, noncomposite, 70-nanosecond or faster SIMMs

Disk drives

=====

- * Internal 1.2GB IDE hard disk drive
- * Internal Apple SuperDrive floppy disk drive
- Uses high-density, 1.4MB floppy disks
- Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- * Internal 8x-speed CD-ROM drive

Display

=====

Built-in display

..TIL20414-Power_Macintosh_5260-120-Specifications_10-96_(TA36007).pdf

- * 14-in. (12.3-in. diagonal viewable image size) shadow-mask color display
- * 16-bit-per-pixel RGB color
- * 640- by 480-pixel resolution
- * 0.28-mm dot pitch
- * 66.67-Hz refresh rate
- * Tilts from -5° to +15°, swivels a full 360°
- * Front-panel controls for adjusting screen brightness
- * Very low ELF/VLF emissions

Display support

-----s

- * 16-bit color for display of up to 32,768 colors at 640- by 480-pixel resolution
- * 1MB video frame buffer (independent of system RAM)

Sound

=====

- * Stereo 16-bit sound
- * Built-in stereo speakers
- * Sound-output port
- * Sound-input port
- * Front headphone jack and volume control
- * Built-in monophonic microphone

Expansion interfaces

=====

- * LC processor-direct slot for networking, communications, and multimedia expansion, such as a modem, Ethernet card, or MPEG video card
 - Compatible with most Macintosh Performa 400 and 500 series; Macintosh Quadra 605; Macintosh LC II, LC III, LC 475, LC 550, LC 575, and LC 630; Performa 630; and Performa and Power Macintosh 5200, 5300, 6200, and 6300 series
- processor-direct cards
 - * Apple Desktop Bus port for mouse, keyboard, and other devices (multiple devices can be connected to each other from one port)
 - * Two RS-232/RS-422 serial ports for an AppleTalk network connection, other networking connections, communications equipment, or a printer (some models include built-in modem that uses one serial port)
 - * SCSI interface port for as many as five external SCSI devices, such as disk drives or CD-ROM drives
 - * Communications slot for Ethernet card or fax/data modem card
 - * Video slot for video-input card (such as the Apple Video System)
 - * TV tuner connector and infrared control sensor for TV tuner card (such as the Apple TV/FM Radio System or the Apple TV/Video System)

Electrical requirements

=====

- * Line voltage: 110 to 240 V AC, RMS, single phase, nominal
- * Frequency: 50 to 60 Hz
- * Power: 240 W maximum
- * U.S. EPA Energy Star compliant

Size and weight

=====

- * Height: 17.5 in. (44.5 cm)
- * Width: 15.1 in. (38.3 cm)
- * Depth: 16 in. (40.6 cm)
- * Weight: 45 lb. (20.5 kg)

Operating environment

=====

- * Operating temperature: 50° to 104° F (10° to 40° C)
- * Storage temperature: -40° to 116° F (-40° to 47° C)
- * Relative humidity: 20% to 95%, noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Disability access

=====

- * CloseView software magnifies screen image up to 16 times
- * Easy Access software permits combination keys to be pressed sequentially and enables cursor control from the numeric keypad instead of the mouse
- * "Visual beep" replaces audible system alerts

Global Village Platinum V Modem: Settings for PPP (9/96)

Revised: 4/21/97
Security: Everyone

Global Village Platinum V Modem: Settings for PPP (9/96)

=====

Article Created: 19 September 1996

TOPIC -----

What are the recommended configuration settings for maintaining a reliable internet connection with my Global Village Platinum V modem that was included with my Macintosh Performa 6400 series computer?

DISCUSSION -----

According to Global Village the steps are as follow:

Step 1

Set the port speed to 57600 bps.

Step 2

Set the Flow Control to CTS + RTS (DTR).

Step 3

Set the Init string to:

AT&F1W1S95=44

Global Village Modem: Isolating Voice/Data Integrity (9/96)

Revised: 9/19/96
Security: Everyone

Global Village Modem: Isolating Voice/Data Integrity (9/96)

=====

Article Created: 18 September 1996

TOPIC -----

Is there a way to rapidly isolate an internal Global Village voice-capable modem failure on a Performa computer?

DISCUSSION -----

The following information will help isolate both data and voice integrity. However, keep in mind that these steps are guidelines used in troubleshooting the Global Village modems. A failure of these diagnostics means there is a problem with the modem. However, success simply suggests that the voice and data capabilities of the modem are intact, but there still may be an additional failure symptom with the modem.

Step 1

=====

Open and configure a ClarisWorks serial session. Verify that it is set as follows:

Data Rate: 57600
Parity: None
Data Bits: 8
Stop Bits: 1

Step 2

=====

To test for voice issues, type the following commands, which should elicit the corresponding responses:

Command	Response
-----	-----
AT	OK
AT#CLS=8	OK

```
AT#VRN=0      OK
ATDTn         VCON (n = phone number, e.g. 555-5555)
ATH           OK (hangs up)
```

If all four tests pass, the voice component of the modem is probably functioning correctly.

Step 3

=====

To test for data issues, type the following commands, which should elicit the corresponding responses:

Command	Response
-----	-----
AT	OK
AT&F0	OK
ATZ	OK
ATDT	Dialtone. Press Space to get a NO CARRIER message.

If all four tests pass, the data component of the modem is probably functioning correctly.

Apple Color OneScanner 1200/30: Description (9/96)

Revised: 9/19/96
Security: Everyone

Apple Color OneScanner 1200/30: Description (9/96)

Article Created: 18 September 1996

TOPIC -----

This article contains the Apple Color OneScanner 1200/30 product description.

DISCUSSION -----

The Apple Color OneScanner 1200/30 is a high-quality, multifunction scanner that seamlessly integrates your document processing needs to enhance your productivity. It even includes software that provides quick, easy conversion of optical character recognition (OCR) documents into Hypertext Markup Language (HTML) format for streamlined web authoring.

With its 30-bit, 600 by 1,200-dot-per-inch optical resolution, the Apple Color OneScanner 1200/30 combines superior-quality images with impressive flexibility in manipulating them. For example, you can scan in very small areas at a high resolution and enlarge them for output, without loss of fine details. This scanner's color capabilities are also ideal for capturing details with extreme accuracy; it recognizes more than 1 billion colors and supports ColorSync 2.1 color matching, so the image you see on the display or on printed output accurately and vividly reproduces the quality of the original scan.

But high-quality images are only part of the Color OneScanner 1200/30 story. OneScanner Dispatcher software is included to make it simple to use the Apple Color OneScanner 1200/30 in conjunction with your computer, fax modem, and printer to enhance your productivity. The included Xerox TextBridge 3.0h OCR software provides OCR-to-HTML conversion of text documents, making the process of creating a World Wide Web page (or other materials for posting on the web) faster and easier than ever before. In addition, the Color OneScanner 1200/30 comes with special versions of two powerful image-enhancement plug-in filters: Kai's Power Tools 3.0 SE and KPT Convolver 1.0 SE.

Combining superior image quality with unmatched integration for enhanced productivity, the Apple Color OneScanner 1200/30 is an outstanding, yet economical, scanning solution. It's the perfect choice if you're looking for a

high-performance, high-value scanner to streamline your work-flow while increasing the impact of your communications—in print or online.

Features

=====

Superior Image Quality

- Offers 30-bit, 600- by 1,200-dot-per-inch resolution (4,800- by 4,800-dpi interpolated)
- Recognizes more than 1 billion colors
- Supports ColorSync 2.1 color matching, for excellent color fidelity from scanned image to screen image to printed image

Easy, Integrated Document Processing Capabilities

- Provides automated, single-pass scanning
- Comes with OneScanner Dispatcher 2.0 soft-ware, a powerful, easy-to-use application that helps you take advantage of the scanner's many functions—including scanning, OCR, editing, printing, faxing, copying, archiving, and retrieving images—and provides several enhancements over the original OneScanner Dispatcher software

Flexible Functionality Through Value-added Software and Optional Accessories

- Includes a version of industry-leading Xerox TextBridge OCR software produced exclusively for Apple's OneScanner products that lets you scan printed pages directly into your computer as digital files, eliminating the need for time-consuming, error-prone rekeying
- Provides OCR-to-HTML conversion using Xerox TextBridge software in conjunction with OneScanner Dispatcher software's scanning, archiving, and image-editing capabilities, so you can seamlessly place your text documents into web-authoring applications
- Comes with Kai's Power Tools 3.0 SE and KPT Convolver 1.0 SE, powerful image-enhancement plug-in filters that support your creative efforts by letting you manipulate images
- Supports an Automatic Document Feeder that can handle up to 20 pages at up to legal size, as well as a Transparent Media Adapter that lets you scan transparent 35mm film to 8- by 11-in. printed output and produce true negative-to-positive conversions

Compatibility

- Supports GIF, PICT, TIFF, JPEG, EPS, BMP, and Photoshop formats; the scan plug-in module is compatible with Photoshop plug-in architecture applications
- Integrates with most popular word processing, presentation, image-editing, page-layout, and web-authoring software for the Macintosh

System Requirements

=====

..TIL20419-Apple_Color_OneScanner_1200-30-Description_9-96.pdf

- System software version 7.5 or later
- At least 8MB of RAM (12MB required to use OneScanner Dispatcher and TextBridge OCR software simultaneously)
- Requires at least 640 by 480 resolution for monitors or PowerBook displays

Ordering Information

=====

Apple Color OneScanner 1200/30 Order No. M4495LL/A

- Apple Color OneScanner 1200/30
- OneScanner Dispatcher 2.0 software
- Xerox TextBridge 3.0h OCR software with OCR-to-HTML conversion and user's guide
- Kai's Power Tools 3.0 SE and KPT Convolver 1.0 SE image-editing filters
- User's guide
- Limited warranty

Optional Accessories

Apple Color OneScanner Automatic Document Feeder Order No. M4526G/A

Apple Color OneScanner Transparent Media Adapter Order No. M4527G/A

Apple Color OneScanner 1200/30: Technical Specifications (9/96)

Article Created: 18 September 1996

TOPIC -----

This article contains the Apple Color OneScanner 1200/30 technical specifications.

DISCUSSION -----

Technical Specifications

General

- Scanner type: Single pass, 30-bit scanning
- Color capabilities: Recognizes up to 1 billion colors
- Optical scanning resolution: 600 by 1,200 dots per inch
- Interpolated scanning resolution: 4,800 by 4,800 dots per inch
- Scan area: letter size (21.6 by 29.2 cm); up to legal size (21.6 by 35.6 cm) with Automatic Document Feeder
- Scanning engine speed: Full-page scan, less than 20 seconds; preview scan, less than 6 seconds
- Interface: SCSI-2
- File formats: Supports PICT, TIFF, GIF, JPEG, EPS, BMP, and Photoshop; compatible with most popular word processing, presentation, image-editing, page-layout, and web-authoring software for the Macintosh
- Bulb: Cool-scanning Xenon bulb

Optional Accessories

- Transparent Media Adapter for scanning transparent film and producing true negative-to-positive conversions
- Automatic Document Feeder with 20-page, legal-size capacity OneScanner Dispatcher software
- Controls scanning, OCR, OCR to HTML conversion, editing, printing, faxing, copying, archiving, and retrieving images and provides

integration with popular applications

- Supports Drag and Drop

Additional Software

- Xerox TextBridge 3.0h OCR software with OCR-to-HTML conversion capability
- Kai's Power Tools 3.0 SE and KPT Convolver 1.0 SE image-editing plug-in filters ColorSync 2.1 architecture
- Matches colors from scanned input to display to printed output
- Provides automatic behind-the-scenes color matching
- Works with color-capable Macintosh computers and color input and output devices that take advantage of ColorSync

Electrical Requirements

- Line voltage: 100-240 V AC +/-10%
- Frequency: 50 to 60 Hz, single phase
- Power: 35 W (maximum)

Environmental requirements

- Temperature: 41 to 95 deg. F (5 to 35 deg. C)
- Humidity: 15% to 85%, noncondensing
- Altitude: 0 to 10,000 ft. (0 to 3,048 m)

Size and Weight

- Height: 3.1 in. (7.9 cm)
- Width: 11.3 in. (28.7 cm)
- Depth: 16.3 in. (41.4 cm)
- Weight: 12.1 lb. (5.5 kg)

System Requirements

- System software version 7.5 or later
- At least 8MB of RAM (12MB required to use OneScanner Dispatcher and TextBridge OCR software simultaneously)
- Requires at least 640 by 480 resolution for monitors or PowerBook displays

Ordering Information

Apple Color OneScanner 1200/30 Order No. M4495LL/A

Macintosh Performa: Global Village Toolbox Won't Load (9/96)

Revised: 9/19/96
Security: Everyone

Macintosh Performa: Global Village Toolbox Won't Load (9/96)

=====

Article Created: 16 September 1996

TOPIC -----

I have a Macintosh Performa computer that included a Global Village modem. I am getting an error message on the computer that states that the Global Village Toolbox will not load. What is the most likely cause of this?

DISCUSSION -----

According to Global Village, this may occur if you perform a Custom Install of ONLY Open Transport 1.1 using System 7.5 Update 2.0.

The workaround is to either install the entire System 7.5 Update 2.0 (which will automatically include Open Transport 1.1) or make the Global Village Toolbox extension load first by renaming it (such as by putting a space at the beginning of the file name).

Power Macintosh 8500/150 & 8500/180: Description (9/96)

Revised: 3/19/97
Security: Everyone

Power Macintosh 8500/150 & 8500/180: Description (9/96)

Article Created: 19 September 1996

TOPIC -----

This article contains the description for the Power Macintosh 8500/150 and 8500/180 series computers.

IMPORTANT: Another article in the Tech Info Library title, "Power Macintosh 8500/132 & 8500/150: Description" contains information about the previous 8500/150 configuration.

DISCUSSION -----

If your profession demands a high-performance, expandable computer that can handle any media as easily as text, opt for a Power Macintosh 8500 system. Depending on your needs and cost considerations, you can choose the Power Macintosh 8500/150 or the 8500/180, featuring a 150-MHz PowerPC 604 processor, or a 180-MHz PowerPC 604e processor, respectively. Both high-performance systems make an ideal choice for in-house publishing, media authoring, and technical applications--and because they're processor-upgradable, they protect your investment for the future.

Built-in near-broadcast-quality video-input/output capabilities, high-resolution graphics, an 8x-speed CD-ROM drive, and CD-quality stereo sound add vitality to professional projects and--with Apple's QuickTime software--make media authoring easy.

The three industry-standard Peripheral Component Interconnect (PCI) high-performance expansion slots on these systems let you customize them easily to meet your needs more precisely. You can find PCI cards for a variety of uses, including graphics, storage, and high-speed networking. And if you want to use your Power Macintosh 8500/150 or 8500/180 to run MS-DOS and Windows applications as well as software written for the Macintosh, you can install a PC Compatibility Card from Apple in one of the PCI slots--and switch instantly between computing environments.

Connecting your Power Macintosh 8500/150 or 8500/180 computer to an Ethernet network is easy because it includes both AAUI and 10BASE-T connectors. If you install an optional PC Compatibility Card, you can connect from both the card and the Macintosh logic board simultaneously, for incredibly versatile networking capabilities.

Today, more and more computer users are discovering the wealth of information and communications resources and opportunities offered by the Internet. The Power Macintosh 8500/150 and 8500/180 make it easy to get involved in this rapidly expanding community, because they come with all of the software you need for easy Internet access.

The Power Macintosh 8500/150 and 8500/180: Exceptional performance for handling any media as easily as text, to enhance your creativity.

Features

=====

High performance

- * 150-MHz PowerPC 604 processor or 180-MHz PowerPC 604e processor, user-upgradable to faster processor when available (up to 250 MHz)
- * Built-in floating-point processor and 32K cache for 8500/150 and 64K cache for 8500/180
- * 256K level 2 cache on a DIMM
- * Built-in graphics acceleration

Communications and multimedia

- * 64-bit VRAM graphics subsystem
- * Two high-speed serial ports compatible with GeoPort and LocalTalk cables
- * 8x-speed CD-ROM drive
- * 16-bit stereo audio input and output
- * 24-bit composite and S-video input and output
- * Support for speech-recognition and text-to-speech capabilities
- * Optimized for QuickTime Conferencing software

Expandability

- * Three industry-standard PCI expansion slots
- * SCSI connector for hard disks, CD-ROM drives, and other SCSI devices
- * Internal expansion bay for additional hard disk drive

Compatibility

- * Includes 10BASE-T and AAUI Ethernet connectors
- * Supports Open Transport networking software (TCP/IP and AppleTalk)
- * Runs 680x0 Macintosh applications as well as applications accelerated for Power Macintosh computers
- * Reads Mac OS, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats
- * Runs MS-DOS and Windows applications via optional PC Compatibility Cards
- * Comes with all of the software required for Internet access

System 7.5 software

- * Makes working with different applications consistent, so they're easier to learn and use
- * Allows easy customization of your Macintosh to reflect the way you work
- * Provides active assistance in learning new features with Apple Guide
- * Includes MacLinkPlus file translation software from DataViz

Ordering Information

Cyberdog 1.1: Readme File (9/96)

Revised: 2/17/97
Security: Everyone

Cyberdog 1.1: Readme File (9/96)

=====

Article Created: 19 September 1996
Article Reviewed/Updated: 23 September 1996

TOPIC -----

This article contains the Cyberdog v1.1 Read Me file.

DISCUSSION -----

Using the Mail System

To use the Cyberdog mail system you will need an SMTP/POP3 account on a UNIX machine or other system or a Macintosh server running software such as MailShare or the Apple Internet Mail Server. See your system administrator to acquire an account. Once Cyberdog has been installed, to set up a connection to your server select the Connect To item from the Cyberdog menu, then click on the Mail icon. Mail and other preferences are stored in the "Internet Preferences" file in the Preferences folder, created by the Internet Config extension. If you have currently been using Internet Config and have set up another POP3 mail server your Cyberdog mail connection will already be set up.

Quicktime Version 2.1

To play movies and sounds you find on the network in Cyberdog you will need to have QuickTime version 2.1 or later installed. In previous Cyberdog installers this was installed automatically, but to save space this is no longer included in the Cyberdog installation package.

Reporting Problems

Please use our bug reporting Web page (<http://cyberdog.apple.com/>) to report any bugs or problems you may encounter in using Cyberdog.

Known Incompatibilities

Cyberdog is incompatible with Adobe Type Reunion. If you have this installed in your System, please remove it prior to running Cyberdog.

Known Problems

There is a known problem in Cyberdog when you drag text or picture clippings from the text, picture, web viewer, message editor or the URL field in any Navigator window to the Finder. The document that is created will not open in OpenDoc unless you have previously set your OpenDoc Default memory to 1,400 K or greater. To make this change, do the following:

1. Launch any OpenDoc or Cyberdog document.
2. In the Document menu, select the Document Info menu item.
3. When that dialog opens, click the Size button at the bottom of the dialog.
4. This opens the OpenDoc Memory Requirements dialog.
5. Set the radio button for the OpenDoc Default Size.
6. Increase the memory size to 1,400 K or greater.
7. Close the dialogs by clicking OK.
8. Then close all Cyberdog and OpenDoc documents.

Power Macintosh 8500/150 & 8500/180: Specifications (12/96)

=====

Article Created: 19 September 1996
Article Reviewed/Updated: 10 December 1996

TOPIC -----

This article contains the technical specifications for the Power Macintosh 8500/150 and 8500/180 series computers.

IMPORTANT: Another article in the Tech Info Library title, "Power Macintosh 8500/132 & 8500/150: Specifications" contains information about the previous 8500/150 configuration.

DISCUSSION -----

Upgradable microprocessor

=====

- * 150-MHz PowerPC 604 or 180-MHz PowerPC 604e microprocessor, upgradable to a higher-speed processor when available (up to 250 MHz)
- * Integrated floating-point unit, 32K cache for 8500/150 and 64K cache for 8500/180, and three integer units
- * High-speed system bus (up to 50 MHz)
- * Upgradability (up to 250 MHz)

Memory

=====

- * 16 MB or 32 MB of RAM, expandable to 512 MB via 8 DIMM sockets
- * 4 MB of ROM
- * 256K level 2 cache

Disk drives

=====

- * Internal 1.2 GB or 2 GB Fast SCSI hard disk
- * Internal Apple SuperDrive floppy disk drive
- Accepts high-density 1.4MB disks and 800K disks
- Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks

..TIL20424-Power_Macintosh_8500-150_and_8500-180-Specifications_12-96.pdf

- * Internal 8x-speed CD-ROM drive
- * Expansion bay for additional 3.5-inch hard disk

Interfaces

=====

- * Three PCI expansion slots compatible with PCI 2.0-compliant cards
- * Two high-speed DMA serial (RS-232/RS-422) ports compatible with LocalTalk and GeoPort cables
- * 10BASE-T and AAUI-15 Ethernet connectors; optional PC Compatibility Cards provide multinode support for simultaneous network connections
- * Internal Fast SCSI bus (up to 10MB/s)
- * External SCSI bus (up to 5MB/s)
- * Apple Desktop Bus (ADB) expansion port
- * RCA phono jacks for line-level stereo audio input and output
- * Mini jacks for stereo audio input and output
- * All sound ports support 16-bit audio and up to 44.1-kHz sampling rate
- * DB-15 connector for monitor
- * Composite connectors (RCA phono jacks) for composite video input and output
- * S-video input and output connectors
- * Internal digital audio/video (DAV) connector for video compression/decompression cards

Video input/output subsystem

=====

- * 24-bit video input
 - Real-time video playthrough of up to 640 by 480 pixels with NTSC; 768 by 576 pixels with PAL and SECAM
 - Up to 320- by 240-pixel capture at 25 frames per second with NTSC (with 2GB drive)
 - Maximum capture size of 640 by 480 pixels with NTSC
- * 24-bit video output
 - Support for NTSC and PAL
 - Convolution for flicker reduction at all bit depths

Graphics support

=====

- * 2 MB of VRAM, expandable to 4 MB
- * Fast 64-bit data path to VRAM
- * Support for display resolutions of up to 1,280 by 1,024 pixels
- * 24-bit color up to 1,152- by 870-pixel resolution
- * Refresh rate of up to 75 Hz

GeoPort telephony (Requires GeoPort Telecom Adapter)

=====

- * 14.4-Kbit/s modem support
- * V.17 fax support
- * GeoPort Fax and GeoPort Telephony software included
- * Speakerphone and answering-machine capability

Clock/calendar

=====

- * Custom integrated circuit with long-life battery

Keyboard and mouse

=====

- * Supports ADB keyboards with numeric keypads
- * Comes with an ADB Mouse II

Electrical requirements

=====

- * Line voltage: 100 to 125/200 to 240 V AC, RMS single phase, automatically configured
- * Frequency: 50 to 60 Hz, single phase
- * Power: 225 W maximum, not including display

ADB power requirements

=====

- * Maximum current draw for all devices: 500 mA
(a maximum of three ADB devices is recommended)
- * Mouse draws 10 mA
- * Keyboard draws 25 to 80 mA (varies with keyboard used)

Size and weight

=====

- * Height: 14 in. (35.6 cm)
- * Width: 7.7 in. (19.6 cm)
- * Depth: 15.75 in. (40.0 cm)
- * Weight: 25 lb. (11.3 kg)

Environmental requirements

=====

- * Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- * Storage temperature: -40 to 116 degrees F (-40 to 47degrees C)
- * Relative humidity: 5% to 95% noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

QuickTime 2.5: Using the MIDI Instrument Picker (9/96)

Revised: 9/19/96
Security: Everyone

QuickTime 2.5: Using the MIDI Instrument Picker (9/96)

Article Created: 19 September 1996

TOPIC -----

I installed QuickTime 2.5, and now I cannot find the Instrument Picker that I use to be in QuickTime 2.1.

DISCUSSION -----

The Instrument Picker functions differently than in previous version of QuickTime.

In previous version you were able to access the MIDI Picker function by clicking on the Options button in the Import dialog. Under QuickTime 2.5, you access the MIDI Picker from the Get Info in MoviePlayer after the MIDI file has been converted to a QuickTime file.

After the MIDI file has been converted and the Movie window strip appears, choose Get Info from the Movie menu. From the left side of this dialog box choose Music Track from the pop-up menu and from the right side choose Instruments from the pop-up menu. The Get Info window then displays the MIDI Instrument tracks that were imported. Double-clicking any instrument line item will bring up the instrument selection dialog for that track. This dialog is the same dialog that was reached through a different sequence for QuickTime 2.1.

You can also drag Macintosh sound files onto an Instrument line in the Get Info windows to add custom sounds to your MIDI files.

The Authoring Extras file must be present in the MoviePlayer folder for this to work. MoviePlayer Plug-ins are considered content developer tools and are not supported for general use. The plug-ins can be found at the World Wide Web site:

Display Enabler 2.0.2: Now Utilities 6.0 has Conflict (9/96)

Revised: 9/25/96
Security: Everyone

Display Enabler 2.0.2: Now Utilities 6.0 has Conflict (9/96)

Article Created: 20 September 1996
Article Reviewed/Updated: 25 September 1996

TOPIC -----

I just installed Now Utilities 6.0. When I restarted, I got an error message from Now Startup Manager stating that the Display Enabler crashed my system. Why is this happening?

DISCUSSION -----

The Now Utilities 6.x Toolbox extension is not compatible with Display Enabler 2.0.2. The table below gives you a list of options available depending on what display and version of the Mac OS you have.

Begin_Table

Monitor	Mac OS Version	Display Enabler	Fix
AppleVision 1710AV Display & AppleVision 1710 Display	7.5, 7.5.1, 7.5.2, 7.5.3, 7.5.5	2.0.2*	Use Display Enabler 2.0.2 until the next AppleVision Display software is released, and use the Extensions Manager, not Now Startup Manager.
Other Multiple Scan Display	7.5, 7.5.1, 7.5.2	2.0.2	Upgrade to System 7.3 or later, OR upgrade to Display Enabler version 2.0.3
Other Multiple	7.5.3, 7.5.5	NONE	None. There are no

Scan Display			known conflicts with	
			built-in Display	
			Enabler.	
+=====+=====+=====+=====+				

End_Table

* You must use Display Enabler 2.0.2 with the AppleVision Displays. Display Enabler 2.0.3 is not compatible with the ApppleVision software.

No Modem Services On NuBus MultiPort Server Card (9/96)

Revised: 9/20/96
Security: Everyone

No Modem Services On NuBus MultiPort Server Card (9/96)

=====

Article Created: 20 September 1996

TOPIC -----

I have just installed a MultiPort Server card into my NuBus-based Macintosh computer. When I load up the MultiPort server software and configure the ports I have no modem access. Why?

DISCUSSION -----

In order for the software to see all of the four ports on the card, you must have the CSI server extension loaded at startup. When this software loads it initializes the card. Even though this is non-Apple software, it is necessary.

Open the Remote Access Manager Application that is installed on the hard drive in the Remote Access MP folder. Under the Server Menu, there is an option for Configure Ports. This opens the port information window.

Look in the port information window to see how many ports are available (with one card, it will say, "4 out of 4." If the card is not initialized or loaded properly, it will say "0 out of 4." The extension to initialize the card is included on the CSI disk.

The Remote Access MultiPort software will not allow you to "serve out" the built-in serial ports on a Nubus-based Macintosh computer.

Eric's Solitaire: Corrupt Prefs Cause Crash (9/96)

Revised: 9/20/96
Security: Everyone

Eric's Solitaire: Corrupt Prefs Cause Crash (9/96)

=====

Article Created: 20 September 1996

TOPIC -----

I have a copy of Eric's Solitaire Sample that was included on the CD-ROM disc, which came with my Power Macintosh computer. It worked properly at first, but now whenever I try using the application, it just quits after I launch it. I have reinstalled the software, but that has not helped. How can I fix this?

DISCUSSION -----

Eric's Solitaire Sample has a preference file which can get corrupted. When this happens, the application quits, or crashes after it is launched. To use the application again, open the Preference folder in your System folder, and throw away the file called Eric's Solitaire Sampler Prefs. The next time you launch Eric's Solitaire Sampler, a new copy of the prefs are created.

Color OneScanner Dispatcher: Window Doesn't Auto Appear (9/96)

Revised: 9/20/96
Security: Everyone

Color OneScanner Dispatcher: Window Doesn't Auto Appear (9/96)

=====

Article Created: 20 September 1996

TOPIC -----

The Dispatcher window does not necessarily automatically display when OneScanner Dispatcher v2.0 launches. This is different than earlier versions of the Dispatcher. With v2.0 if the Dispatcher window was closed at the time you quit the program, then the Dispatcher window will be closed the next time you launch the application.

DISCUSSION -----

To display this window, from the Window menu choose Dispatcher or press the command key and 0 (zero -- not 'oh, this opens the Open File dialog) simultaneously.

Apple Media Tool: Can't Set Dissolve Duration (9/96)

Revised: 9/20/96
Security: Everyone

Apple Media Tool: Can't Set Dissolve Duration (9/96)

=====

Article Created: 20 September 1996

TOPIC -----

I am using Apple Media Tool to create presentations. I have selected the "dissolve" effect to transition between pictures and would like to slow down the time it takes to change. Is there a way to do this? I have also discovered that the dissolve effect does not look the same on computers using Microsoft Windows. Why?

DISCUSSION -----

There is no way to set the number of "ticks" for the "dissolve" effect. The faster your machine, the faster the dissolve functions. The other transitions in Media Tool do let you change the duration, but not dissolve.

On Windows platforms, the dissolve feature may often appear blocky or not show a transition at all. If your video card supports it, try setting the colors to thousands, or 16-bit color. This allows more colors and creates smoother transitions.

Memory Configurations: Power Macintosh (1 of 4) (2/97)

Article Created: 23 September 1996
Article Reviewed/Updated: 24 February 1997

TOPIC -----

What are the memory configurations for desktop Power Macintosh computers?

DISCUSSION -----

The following table includes the memory configurations for desktop Power Macintosh computers.

For information about upgrading the memory in another Macintosh computer, use the search string "memory configurations" to locate the following articles:

"Memory Configurations: Servers (2 of 4)"
"Memory Configurations: Portables & PowerBook (3 of 4)"
"Memory Configurations: Other Desktop Macintosh (4 of 4)"

Notes:

* The Power Macintosh 7500, 7600, 8500, and 9500 series computers support memory interleaving. Although you can install DIMMs one at a time, you can get increased performance by installing them in pairs.

* 128 MB DIMMs are available and can fit into the memory slots on the Power Macintosh 7200, 7500, 7600, 8500, and 9500 computers. However, these DIMMs have not been tested with these computers and are therefore not supported by Apple.

PC Compatibility Card: Some Shipped With Bad Floppy Disks (9/96)

Revised: 9/23/96
Security: Everyone

PC Compatibility Card: Some Shipped With Bad Floppy Disks (9/96)

Article Created: 23 September 1996

TOPIC -----

I am trying to install the software for the PC Compatibility Card in my PCI-based Power Macintosh computer. If I insert the PC Compatibility Card PC Software floppy disk in the PC environment, the computer ejects the floppy disk. If I insert the floppy on the Macintosh environment, it shows up on the desktop, but it shows up as a Macintosh-formatted floppy disk.

The floppy disks appear to be labelled correctly (sticker says PC Compatibility Card PC Software), but they are apparently empty Macintosh-formatted floppy disks with the name "pc comp.sw [pc disk] label." Can I somehow make these disks work?

DISCUSSION -----

This floppy disk includes PC files that are necessary for certain features of the PC Compatibility Card. Unfortunately, some of these floppy disks were not formatted and created properly at Apple. Follow these steps to recreate this floppy disk:

Step 1

Unlock the floppy disk.

Step 2

Switch to the Macintosh environment.

Step 3

Insert the floppy disk.

Step 4

Pull down the File menu and select 'Erase Disk...'.

Step 5

Change the name to 'APPLE_PC'.

Step 6

Change format to 'DOS 1.4 MB'.

Step 7

Click 'Erase'.

Step 8

Insert the CD-ROM disc labeled 'PC Utilities'.

Step 9

Open the folder named 'Apple'.

Step 10

Copy the contents of this folder to the floppy disk.

Step 11

Eject the floppy disk.

Step 12

Lock the floppy disk.

After the floppy has been formatted for DOS and the files have been copied onto the floppy, you can install the software by running A:SETUP.

Issue With Stickies & LaserWriter Driver Version 8.4 (9/96)

Revised: 9/23/96
Security: Everyone

Issue With Stickies & LaserWriter Driver Version 8.4 (9/96)

=====

Article Created: 23 September 1996

DISCUSSION -----

I have seen four different Macintosh computers (two of my own) that appear to cause Stickies to unexpectedly quit when trying to print a note. This started to happen on all of these computers after installing LaserWriter v8.4 printer drivers (desktop printing included). What is wrong?

DISCUSSION -----

Workaround

Apple Engineering is aware of this issue. This is not a printer driver-related issue. This issue is related to Stickies running out of memory. The easiest way to resolve this issue is to increase the "Minimum" and "Preferred" sizes of Stickies by 20K to 140K. This should resolve the problem. Stickies is normally set to 120K for all three settings: Suggested, Minimum, and Preferred.

Resolution

Future versions of the Stickies application will have the memory requirements in "Suggested," "Minimum," and "Preferred" sizes set to be 20K greater (at least 140K).

OpenDoc 1.1: ReadMe File (9/96)

Revised: 9/23/96
Security: Everyone

OpenDoc 1.1: ReadMe File (9/96)

Article Created: 23 September 1996

TOPIC -----

This article is from the Read Me file included with the OpenDoc 1.1 software.

DISCUSSION -----

What is OpenDoc?

OpenDoc is a new plug-in software architecture that lets you extend the usefulness of your applications by easily adding new functionality. OpenDoc uses software components called parts that can be dragged-and-dropped into documents created by any OpenDoc-aware application. You can combine parts from different Mac OS software developers to add tables, graphs, outlines, and even live Internet resources into your documents. Since OpenDoc is a cross-platform technology, documents created with OpenDoc can work across different computer platforms, including Mac OS, Windows, UNIX, and OS/2.

What does OpenDoc install?

Installing OpenDoc adds the following items to your computer:

- OpenDoc system software (in the Extensions folder)
- the Editors folder (in the System Folder)
- the Stationery folder (at the root level of your hard disk)

OpenDoc system software

After you install OpenDoc system software, your computer is ready to use OpenDoc parts and OpenDoc-aware applications from popular Mac OS software developers.

The Editors folder

When you install OpenDoc parts, the part editors are placed in the Editors folder. Editors are like mini-applications that handle different types of data, such as text, graphics, or Internet information. Once an editor is installed, it works something like a system extension, its functionality is available but you do not open or use the editor itself. To use an editor, you need to locate the editors stationery (in the Stationery folder on the root level of your hard drive).

IMPORTANT NOTE:

All of your OpenDoc editors should be located in the Editors folder (inside the System Folder). Otherwise, OpenDoc will not be able to locate the editors.

The Stationery folder

When you install an OpenDoc part, part stationery is placed in the Stationery folder. You can either double-click an editors stationery to create a new document with the editor or drag the stationery into another document to add the editors functionality to any OpenDoc-aware application or document. OpenDoc stationery can be placed anywhere in your system. You do not have to leave it in the Stationery folder.

Where can I get more information?

For more information about OpenDoc and developers who are producing OpenDoc-aware software, look on the World Wide Web at <http://opendoc.apple.com>.

Pwr Mac 9500/200: Where's Drive Setup Read Me (9/96)

Revised: 2/17/97
Security: Everyone

Pwr Mac 9500/200: Where's Drive Setup Read Me (9/96)

=====

Article Created: 23 September 1996

TOPIC -----

This article contains the Read Me file for Drive Setup included with the Power Macintosh 9500/200 computer.

DISCUSSION -----

Important Information About Possible Problems Initializing Your Hard Disk

=====

Read this information carefully before you initialize (or erase) the factory-installed hard disk that came with your computer.

Contents

=====

- Introduction
- Symptoms of the Problem
- Correcting the Problem
- Initializing Your Hard Disk Properly

Introduction

=====

Apple supplies a hard disk utility program called Drive Setup that you can use to initialize, test, and set other options for the factory-installed hard disk inside your computer. The hard disk was initialized and set up properly at the factory, so you shouldn't need to initialize it unless your hard disk is damaged and cannot be repaired by the Disk First Aid program. (See your user's manual for more information about Disk First Aid.)

If you need to initialize your factory-installed hard disk, you should use Drive Setup instead of a third-party hard disk utility program. Your computer will only start up properly if you use Drive Setup and then run the Drive Setup Updater utility program, which corrects a problem that could prevent your computer from starting up properly.

Note the following:

- The Drive Setup Updater utility is only compatible with hard disks that have been initialized with Drive Setup; the Drive Setup Updater will not work properly with other hard disk utility programs. Therefore, until third-party manufacturers upgrade their hard disk utility programs, you must use Drive Setup and the Drive Setup Updater to properly initialize your factory-installed hard disk.
- If you connect one or more additional hard disks to your Macintosh, you can initialize them with a hard disk utility program other than Drive Setup, and you do not need to run the Drive Setup Updater. However, you should only use your factory-installed hard disk as your startup disk. (The startup disk is the disk that contains the System Folder.)
- Drive Setup only works with factory-installed hard disks. If you replace the factory-installed hard disk with a third-party drive, you must use a third-party hard disk utility program to initialize the drive. Before you replace the factory-installed hard disk with a third-party drive, make sure your hard disk utility program is compatible with your Power Macintosh model. You may need to contact the manufacturer of the hard disk utility program to obtain a more recent version.
- If you are using a Workgroup Server, you can also initialize your factory-installed hard disk with Apple RAID Software version 1.1.1.

Reminder: The factory-installed hard disk inside your computer was initialized and set up properly at the factory, so you shouldn't need to initialize it unless your hard disk is damaged and cannot be repaired by the Disk First Aid program. (See your user's manual for more information about Disk First Aid.)

Symptoms of the Problem

=====

If you recently initialized your factory-installed hard disk or you are attempting to use a different hard disk as your startup disk, you may be experiencing a problem starting your computer. When you turn on or restart your computer, the screen may remain blank; or your computer may play the startup "chime," but not show the "Welcome to Macintosh" dialog box or start up properly. This problem may be intermittent; if you restart the computer, it may start up correctly, or the problem may reoccur.

Note: There are other reasons why your computer may not start up properly. (For example, if you recently connected another hard disk, you could be having a SCSI ID conflict.) In addition to the suggestions below, see the troubleshooting chapter in your user's manual for additional information.

Correcting the Problem

=====

If you are experiencing the problem described above, you can correct it by following these suggestions.

Try running the Drive Setup Updater program

1. Start up your computer from the system software CD-ROM disc that came with your computer.

To start up from the CD, insert the CD into the computer, and turn it off by pressing the Power button on the front. (The CD remains in the drive.) Then hold down the C key on your keyboard while you press the Power key on the keyboard. Continue to hold down the C key until you see the "Welcome to Macintosh" message.

2. Insert the "Drive Setup Software" floppy disk, locate the "Drive Setup Updater" icon, and double-click it to open the program.

A dialog box appears that describes the updater.

3. Click Install.

You see a message that the installation was successful.

4. Click OK.

5. Restart your computer.

Your computer should now start up properly. If it still does not start up, follow the next suggestion.

Make sure your factory-installed hard disk is your startup disk

The startup disk is the disk that contains the System Folder. If you are using two or more hard disks with your computer, it may only start up properly if the factory-installed hard disk is the startup disk. Follow these steps to make sure your factory-installed hard disk is the startup disk.

1. Copy the System Folder from your current startup disk to the factory-installed hard disk.
2. Choose Control Panels from the Apple menu.
3. Double-click the "Startup Disk" icon.

The Startup Disk window appears.

4. Select the icon for the factory-installed hard disk.
5. Close the Startup Disk window and restart your computer.

Initializing Your Hard Disk Properly

=====

This section describes how to initialize your factory-installed hard disk using Drive Setup and the Drive Setup Updater. If you are having problems starting up your computer, see the previous sections, "Symptoms of the Problem" and "Correcting the Problem" before you reinitialize your hard disk.

WARNING Initializing a disk erases any information on it. Before you initialize

a disk, copy your important files to floppy disks or some other form of backup media.

1. Start up your computer from the system software CD-ROM disc that came with it.

To start up from the CD, insert the CD into the computer, and turn it off by pressing the Power button on the front. (The CD remains in the drive.) Then hold down the C key on your keyboard while you press the Power key on the keyboard. Continue to hold down the C key until you see the "Welcome to Macintosh" message.

2. Copy your important files from the disk you want to initialize to floppy disks or some other form of backup media.

3. Insert the "Drive Setup Software" floppy disk, locate the Drive Setup icon, and double-click it to open the Drive Setup program.

4. In the list of drives, click the name of the drive you want to initialize.

5. Click Initialize.

6. In the Initialize dialog box, click Custom Setup if you want to partition your drive. Otherwise, click Initialize.

For information about partitioning your drive, choose Drive Setup Guide from the Guide (?) menu.

7. Click Quit when you see a message reporting that the initialization was successful.

If a message reports that initialization failed, try again. If initialization fails a second time, take the disk to your Apple-authorized service provider for repairs.

8. Find the "Drive Setup Updater" icon on the "Drive Setup Software" floppy disk and double-click the icon to open it.

A dialog box appears that describes the updater.

9. Click Install.

You see a message that the installation was successful.

10. Click OK.

11. Install the Mac OS system software from the CD-ROM disk onto the hard disk you just initialized.

See your user's manual for detailed instructions on installing system software.

Macintosh 630 & Apple Personal Modem: Can't Hear Messages(10/96)

Revised: 10/2/96
Security: Everyone

Macintosh 630 & Apple Personal Modem: Can't Hear Messages(10/96)

Article Created: 23 September 1996
Article Reviewed/Updated: 2 October 1996

TOPIC -----

I have a Macintosh 630 series computer with the Macintosh Processor Upgrade installed. When I am in PPC Mode, I am unable to hear voice message from my Apple Personal Modem. However, it works fine in 68K Mode. What could be causing this?

DISCUSSION -----

What is Apple Personal Modem?

- * The Apple Personal Modem you have is an international (Europe and Asia) product only. This modem does have some voice capabilities. There are two models: one is 14.4 kbps and the other is 28.8 kbps.
- * Apple Personal Modem is also the name of the software that comes with these modems.
- * There was also another modem (now discontinued) that was also named the Apple Personal Modem. It was a U.S. external modem that ran at 1200 kbps or 300 kbps.

Resolution

This issue you mentioned can resolved by installing Apple Personal Modem (APM) 2.1.6 in addition to System software 7.5.3 or later.

Global Village Gold II Modem: Unable to Redial (9/96)

Revised: 9/24/96
Security: Everyone

Global Village Gold II Modem: Unable to Redial (9/96)

=====

Article Created: 23 September 1996

TOPIC -----

My Global Village Teleport Gold II modem (which was included with my Macintosh Performa computer) connects reliably using PPP, included with the Apple Internet Connection Kit (AICK), but if I conclude that session by hanging up, and then attempt to redial, the connection is never established. What is causing this?

DISCUSSION -----

According to Global Village Communication (GVC), ALL settings in the Teleport control panel should be OFF (unchecked). Also, the radio buttons for error correction should be set to OFF.

The Apple Internet Dialer sets the modem initialization string to AT&F1&K3. According to Global Village, if you have difficulty using this string, change this to AT&F1 (which GVC's recommended default setting and is the same as a generic modem in the AICK Dialer).

You can change to this string either by selecting 'generic' as the Modem Type or by selecting and editing Add/Modify Modem Type in the Dialer's pop-up dialog box..

Global Village notes that it may also be necessary to append the string with &D2, a command which writes out all the buffered data and then hangs up at the end of the session. In this case, the edited string would be AT&F1&D2.

Apple MIDI Interface: Maximum Connected MIDI Devices (9/96)

Revised: 9/24/96
Security: Everyone

Apple MIDI Interface: Maximum Connected MIDI Devices (9/96)

=====

Article Created: 24 September 1996

TOPIC -----

What is the maximum number of MIDI (Musical Instrument Digital Interface) devices that can be connected to a Macintosh using the Apple MIDI interface?

DISCUSSION -----

The Apple MIDI Interface has one Output and one Input port. However, with these ports the interface can communicate with 16 different MIDI channels, which is the standard established by the MIDI Developers Association.

All 16 channels can be used by one MIDI device, such as a keyboard synthesizer, or the channels can be split up among several different MIDI devices. You could even have 16 different devices each playing one part of a song, each part being received on 1 channel. A common practice is for channel 10 to go to the device that is going to play the drum parts and then the other 15 channels are used to go to other MIDI devices. One MIDI device might play the Piano sounds while another one might have that awesome bass sound that you gotta have.

The Apple MIDI Interface only has one Input so it can only accept input from one MIDI device at a time. To receive input from two sources at the same time using the Apple MIDI Interface, you would need to add a MIDI merge box (from a third-party developer).

More complicated MIDI interfaces are available from third-party companies that offer multiple Input and Output ports. If you have a more involved setup that includes multiple input devices, such as keyboards, drum triggers, MIDI guitars, and so on, you should consider a more complicated MIDI interface. The multiple Outputs allows the musician to access 16 channels per output. If the MIDI interface has 8 outputs then data can be sent to $8 \times 16 = 128$ different MIDI channels.

Global Village Modem: No Max Throughput Checkbox (11/96)

Revised: 11/12/96
Security: Everyone

Global Village Modem: No Max Throughput Checkbox (11/96)

=====

Article Created: 24 September 1996
Article Reviewed/Updated: 12 November 1996

TOPIC -----

I have a Macintosh Performa computer with a Global Village modem. I do not see a "Max Throughput" check-box in the Teleport control panel. Why?

DISCUSSION -----

The "Max Throughput" checkbox is only available on computers that support Direct Memory Access (DMA). Currently, only the Macintosh Performa 6100 and 6400 series computers support this capability, and only the 6400 is bundled with a modem for which this is an option.

The feature requires that the functionality be installed in hardware; there is not a software-based patch to implement DMA. Without DMA support, Macintosh computers are limited to a 57.6 Kbaud throughput rate.

System 7.5.5 Update Installer & Energy Saver 1.x Issue (9/96)

Revised: 9/24/96
Security: Everyone

System 7.5.5 Update Installer & Energy Saver 1.x Issue (9/96)

Article Created: 24 September 1996

TOPIC -----

This article describes an issue with the System 7.5.5 Update installer and the Energy Saver 1.x control panel.

DISCUSSION -----

Apple has discovered an issue in the System 7.5.5 Update installer that affects users who are updating a system with the Energy Saver 1.x control panel installed.

Details

- If a user has Energy Saver 1.x installed in the control panels folder, the System 7.5.5 Updater installation will fail with an error message stating the Energy Saver control panel must be moved.
- If Energy Saver 1.x has been disabled with the Extensions Manager control panel (and is in the disabled control panels folder), the installer will update it to a corrupted version of Energy Saver control panel 2.0.2.
- Users will be unable to open the corrupt Energy Saver file, and an error message is displayed stating that the file contains the Energy Saver Preferences and should be in the Preferences Folder.

Workaround

- 1) The work around is to remove the Energy Saver 1.x control panel from the System Folder, such as placing the control panel on the desk top, before installing the System 7.5.5 Updater.
- 2) When this is done, System 7.5.5 Update will not install Energy Saver Control Panel 2.0.2.

3) Energy Saver 1.x should then be placed back into the Control Panels folder after the update is done.

NOTE: Important information about this workaround.

- Energy Saver 1.x is only needed for those computers that have energy saving monitors but not the ability to put the whole system to sleep. This includes the NuBus-based Power Macintosh, some Performa PowerPC-based, and Macintosh Quadra computers.
- Energy Saver 2.0.x only works on desktop systems that support putting the whole system to sleep and not just the monitor, such as the PCI Power Macintosh computers.

Japanese Language Kit: Document Error with WordPerfect (9/96)

=====

Article Created: 24 September 1996

TOPIC -----

I have System 7.5 on my Macintosh. I am using WordPerfect 3.1 and Japanese Language Kit (JLK) 1.x. Whenever I try to paste text from JLK into a WordPerfect document - I get a 'document error.'

DISCUSSION -----

Corel has a WordPerfect 3.1 Patch to correct this issue. From the WordPerfect Patch Read Me File:

"This updater fixes some problems with WordPerfect and the Japanese Language Kit, and adds some enhancements. Specifically:

- Problems with pasting formatted text from a third party application into WordPerfect
- Speed enhancements"

You can obtain the patch on the Internet at:

ftp://ftp.corel.com/pub/wordperfect/wordperfect/wpmac/updates/WordPerfect_3.1_Patch.hqx

Chinese Language Kit: Must Remove Launcher to Install (10/96)

Revised: 10/7/96
Security: Everyone

Chinese Language Kit: Must Remove Launcher to Install (10/96)

Article Created: 25 September 1996
Article Reviewed/Updated: 2 October 1996

TOPIC -----

I am attempting to install the Chinese Language Kit onto my computer, but an error message occurs stating that it "cannot install onto this version of _Performa_ software." However, I do not have a Macintosh Performa computer, so I do not understand why this error is occurring.

DISCUSSION -----

The error message is confusing, but the solution is the same whether or not you have a Macintosh Performa computer. To Install the Chinese Language Kit 1.0 under System 7.5.x, you must remove the Launcher from the Control Panels folder. This will then allow the installation to take place. However, you will also need to install the Chinese Language Kit Update 1.1.1, available online, to be compatible with System 7.5.x.

System 7.5.5 Update & Express Modem 3.0 Issue (9/96)

Revised: 9/25/96
Security: Everyone

System 7.5.5 Update & Express Modem 3.0 Issue (9/96)

=====

Article Created: 25 September 1996

TOPIC -----

This article describes an issue when using Express Modem 3.0 (delivered by Apple Telecom 3.0) software with the System 7.5.5 Update.

DISCUSSION -----

If you install Apple Telecom 3.0 or Express Modem 3.0 after installing the System 7.5.5 Update you will not be able to switch on your Express Modem. To fix this incompatibility, run the System 7.5.5 Update again. The System 7.5.5 Update updates your Express Modem 3.0 to Express Modem 3.0.1.

NOTE: Apple Telecom 3.0 shipped on some new Macintosh systems and is not presently available from Apple for download or purchase.

Education Software Bundles: Included CDs Run Slowly (9/96)

=====

Article Created: 25 September 1996

TOPIC -----

What can cause some of the CD-ROM discs included with the Education Software Bundles to run slowly?

DISCUSSION -----

If Virex is installed on the computer (from mixing and matching software bundles), turn off the "Scan When File Opened" preference in the Virex control panel.

Education Software Bundles: Adobe Type Manager Error (9/96)

=====

Article Created: 25 September 1996

TOPIC -----

I have both the Power Macintosh 5260 Bonus and the Multimedia Learning Tools Education Bundles installed on the computers, and I am getting Adobe Type Manager error messages when the computers are started up. What could be causing this?

DISCUSSION -----

This error is caused by a version conflict between two versions of the ~ATMcontrol panel installed by each bundle. Use the latest version of Adobe Acrobat, which is version 2.1 and remove the older version of the control panel.

Macintosh Performa 6360/160: Description (11/96)

Article Created: 25 September 1996
Article Reviewed/Updated: 11 November 1996

TOPIC -----

This article contains the description for the Macintosh Performa 6360/160 computer.

DISCUSSION -----

With its powerful RISC processor and industry-standard PCI expansion slot, the Apple Macintosh Performa 6360 system combines performance for today with expandability for tomorrow.

As you'd expect from Macintosh systems, the Performa 6360 includes a host of features that bring multimedia to life. A RISC-based PowerPC 603e processor running at 160 megahertz delivers the performance you need to run advanced multimedia applications, while the built-in 8x-speed CD-ROM drive provides smooth video and audio.

A 64-bit video architecture and 1 megabyte of video memory display high-quality video and realistic graphics on monitors up to 17 inches (diagonal measurement) in size.

The system also features 16-bit CD-quality stereo input and output with SRS surround sound--a combination that will add a whole new audio dimension to your multimedia experience.

With 16 megabytes of RAM (expandable to 136 megabytes), the Macintosh Performa 6360 has the memory to run powerful multimedia applications. And its 1.2-gigabyte hard disk drive gives you the storage you'll need for a long time to come.

If you need to expand your system, the built-in PCI expansion slot is perfect for graphics acceleration, high-speed networking, or other high-performance capabilities.

For connecting to the Internet, the Performa 6360 offers easy access either through America Online (in the United States) or directly via the Apple Internet Connection Kit, which features Netscape Navigator software. Both America Online and Internet Connection Kit software are installed and ready to use on your new Performa system. And with the built-in 28.8-kilobit-per-second data/voice/fax modem (fax speeds up to 14.4 Kbit/s; data speeds up to 28.8 Kbit/s), exchanging e-mail and browsing the World Wide Web can be fast.

Also preinstalled on or packaged with the computer are more than a dozen other home, education, and home-business programs, plus a collection of multimedia reference CDs.

If you need compatibility with MS-DOS or Windows software-based computers, a Performa 6360 system gives you several choices. You can share floppy disks and files by using Macintosh PC Exchange and Macintosh Easy Open software (both included). For the ultimate in compatibility, Apple's optional PC Compatibility Card puts a 100-megahertz 586-class processor right in your computer.

The Macintosh Performa 6360 computer: The power and versatility of RISC, PCI, and the Mac OS in one affordable, easy-to-use system.

Features

=====

High performance

- * 160-MHz PowerPC 603e processor
- * Built-in 28.8-Kbit/s data/voice/fax modem*
- * Built-in 8x-speed, tray-loading CD-ROM drive
- * Optional 256K level 2 cache

Rich multimedia

- * Support for up to 32,768 colors (16-bit color up to 800- by 600-pixel resolution and 8-bit color up to 1,024- by 768-pixel resolution)
- * 16-bit CD-quality stereo sound with SRS surround sound

Expandability and flexibility

- * Industry-standard 6.88-inch PCI expansion slot
- * Support for up to six external SCSI devices, such as hard disk drives and scanners
- * Optional High Performance Module, Apple Video System, Apple TV/FM Radio System, Avid Cinema, and PC Compatibility Card

Ease of use

- * Macintosh System 7.5 software, including Apple Guide software for step-by-step help with basic system operation
- * Apple Internet Connection Kit featuring Netscape Navigator software for quick, easy access to global resources, including the World Wide Web
- * Plug-and-play installation of expansion cards, storage devices, scanners, printers, digital cameras, and other accessories

Preinstalled software

- * Macintosh System 7.5
- * ClarisWorks
- * Quicken Special Edition
- * America Online
- * Apple Internet Connection Kit
- * SurfWatch
- * Web Workshop
- * MegaPhone for Performa
- * Adobe PhotoDeluxe
- * Now TouchBase and Datebook Pro
- * MacLinkPlus/Easy Open Translators
- * At Ease
- * The American Heritage Dictionary
- * Click Art Performa Collection
- * MacGallery Clip Art Treasure Pak
- * DOGZ Adoption Kit

CD-ROM titles

- * The Grolier Multimedia Encyclopedia
- * Our Times
- * Mayo Clinic Family Health
- * Amazing Writing Machine
- * The American Heritage Children's Dictionary
- * Blockbuster Guide to Movies & Videos
- * Thinkin' Things Collection 2
- * Club KidSoft CD
- * 3D Atlas
- * Descent

Macintosh Performa 6360/160: Specifications (11/96)

=====

Article Created: 25 September 1996
Article Reviewed/Updated: 12 November 1996

TOPIC -----

This article contains the technical specifications for the Macintosh Performa 6360/160 computer.

DISCUSSION -----

Microprocessor

=====

- * PowerPC 603e processor running at 160 MHz
- * Integrated floating-point unit
- * 40-MHz, 64-bit bus
- * Optional High Performance Module (256K level 2 cache; see ordering information)
- * 32K internal cache

Memory

=====

- * Two DIMM expansion slots
- * Comes with 16 MB of RAM (8 MB on logic board and 8 MB in one DIMM socket)
- * Can be expanded to 136 MB
- * Uses 64-bit-wide, 168-pin, noncomposite, 70-nanosecond or faster DIMMs (1K or 2K refresh)

Disk drives

=====

- * Internal 1.2GB IDE hard disk drive
- * Internal Apple SuperDrive floppy disk drive
 - Uses high-density, 1.4MB floppy disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- * Internal 8x-speed CD-ROM drive

Modem

=====

- * 28.8-Kbit/s internal Geoport data/voice/fax modem (fax speeds up to 14.4 Kbit/s; data speeds up to 28.8 Kbit/s)
- * Built-in error correction and compression (MNP4, V.42, MNP5, V.42bis)

Sound

=====

- * Stereo 16-bit sound
- * SRS surround sound enhancement
- * Sound-input port (for an Apple PlainTalk microphone)
- * Sound-output port
- * Front headphone jack and volume control

Display support

=====

- * 1 MB of video RAM
- * 16-bit color for display of up to 32,768 colors on monitors using 640- by 480-pixel or 800- by 600-pixel resolution
- * 8-bit color for display of 256 colors on monitors using 832- by 624-pixel or 1,024- by 768-pixel resolution

Interfaces

=====

- * PCI expansion slot (requires PCI card that comes with a Macintosh driver and is PCI 2.0 compliant; a NuBus card cannot be used in this slot)
- * PCI-based communications (Comm II) slot for a 28.8-Kbit/s modem (used by the built-in data/voice/fax modem)
- * Two serial ports (RS-232/RS-422) for an AppleTalk network connection, other network connections, communications equipment (including GeoPort compatible devices), or a printer (one port used by the built-in modem)
- * SCSI interface port for connecting as many as six external SCSI devices, such as disk drives, CD-ROM drives, and scanners (multiple devices can be connected to each other from one port)
- * Apple Desktop Bus port for mouse, keyboard, and other devices (multiple devices can be connected to each other from one port)
- * Video-output port
- * Video-input slot for optional Apple Video System (supports NTSC, PAL, and SECAM video formats)
- * Expansion bay for optional Apple TV/FM Radio System
- * Infrared receiver for remote control (provided with Apple TV/FM Radio System and certain other accessories)

Disability access

=====

- * CloseView software magnifies screen image up to 16 times
- * Easy Access software permits combination keys to be pressed sequentially and enables cursor control from the numeric keypad instead of the mouse
- * "Visual beep" replaces audible system alerts

Electrical requirements and compliance

=====

- * Line voltage: 90 to 270 V AC, RMS, single phase

- * Frequency: 47 to 63 Hz
- * Power: 150 W maximum (continuous)
- * Includes low-power sleep mode
- * U.S. EPA Energy Star compliant

Size and weight

=====

- * Height: 4.3 in. (11.0 cm)
- * Width: 12.6 in. (32.0 cm)
- * Depth: 16.5 in. (42.0 cm)
- * Weight: 17 lb. (7.7 kg)

Operating environment

=====

- * Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- * Storage temperature: -40 to 116.6 degrees F (-40 to 47 degrees C)
- * Relative humidity: 5% to 95%, noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Power Macintosh 6400/180 & 6400/200: Description (11/96)

Revised: 11/1/96
Security: Everyone

Power Macintosh 6400/180 & 6400/200: Description (11/96)

=====

Article Created: 25 September 1996
Article Reviewed/Updated: 1 November 1996

TOPIC -----

This article contains the description for the Power Macintosh 6400/180 and 6400/200 computers.

DISCUSSION -----

The Apple Power Macintosh 6400/180 and 6400/200 are among the most powerful, expandable, easy-to-use multimedia computers you can get. Continuing Apple's multimedia leadership, their robust features make them ideal systems on which to learn, create, and communicate.

A state-of-the-art RISC-based PowerPC 603e processor running at 200 megahertz or 180 megahertz (depending on the system configuration) delivers the performance you need to run an abundance of powerful multimedia applications.

As you'd expect from Macintosh systems, the Power Macintosh 6400/180 and 6400/200 computers include a host of features that will bring your multimedia applications to life. A built-in 8x-speed CD-ROM drive delivers smooth video and audio. A 64-bit video architecture and 1 mega-byte of video memory provide high-quality video and realistic graphics on monitors up to 17 inches (diagonal measurement) in size. These systems also feature 16-bit CD-quality stereo input and output, SRS surround sound, and a subwoofer speaker--a combination that will add a whole new audio dimension to your multimedia experience.

With 16 megabytes of RAM (expandable to 136 megabytes), the Power Macintosh 6400/180 and 6400/200 computers have the memory to run powerful multimedia applications. And the 1.6-gigabyte or 2.4-gigabyte hard drive gives you all the storage you'll need for a long time to come.

For connecting to the Internet, the Power Macintosh 6400/180 and 6400/200 offer easy access through the Apple Internet Connection Kit, which features Netscape Navigator software. And with built-in Ethernet, exchanging e-mail and browsing

the World Wide Web through your network are a snap.

If you need compatibility with MS-DOS or Windows software-based computers, a Power Macintosh 6400/180 or 6400/200 gives you several choices. You can share floppy disks and files by using Macintosh PC Exchange and Macintosh Easy Open software (both included). SoftWindows from Insignia Solutions (available separately) lets you run Windows applications right on your Power Macintosh system. For the ultimate in compatibility, Apple's optional PC Compatibility Card puts a 100-megahertz 586-class processor right in your computer.

The Power Macintosh 6400/180 and 6400/200: High-performance multimedia systems for learning, creating, and communicating.

Features

=====

High performance

- * 180-MHz or 200-MHz PowerPC 603e processor
- * 256K level 2 cache (standard with 200-MHz configuration only)
- * Built-in 8x-speed, tray-loading CD-ROM drive

Rich multimedia

- * Support for up to 32,768 colors and monitors up to 17 inches (diagonal measurement)
- * 16-bit CD-quality stereo sound with SRS surround sound and integrated subwoofer

Expandability and flexibility

- * Two industry-standard PCI expansion slots for 6.88-inch cards
- * Support for up to six external SCSI devices, such as hard disk drives and scanners
- * SCSI expansion bay for additional internal storage device
- * Optional Apple TV/FM Radio System, Avid Cinema, and PC Compatibility Card

Ease of use

- * Apple System 7.5 software, including Apple Guide software for step-by-step help with basic system operation
- * Apple Internet Connection Kit software for quick, easy access to global resources, including the World Wide Web
- * Plug-and-play installation of expansion cards, storage devices, scanners, printers, digital cameras, and other accessories

- * 10BASE-T Ethernet Card included in Communications Slot
- * SCSI interface port for connecting as many as six external SCSI devices, such as disk drives, CD-ROM drives, and scanners (multiple devices can be connected to each other from one port)
- * Pre-cabled SCSI expansion bay for additional 5.25-inch internal SCSI device
- * Apple Desktop Bus port for mouse, keyboard, and other devices (multiple devices can be connected to each other from one port)
- * Two serial ports (RS-232/RS-422) for an AppleTalk network connection, other network connections, communications equipment (including GeoPort compatible devices), or a printer
- * Video-output port
- * Two PCI expansion slots (require PCI cards that come with a Macintosh driver and are PCI 2.0 compliant; NuBus cards cannot be used in these slots)
- * Video input slot for optional Apple Video System (supports NTSC, PAL, and SECAM video formats)
- * Expansion bay for optional Apple TV/FM Radio System
- * Infrared receiver for remote control (provided with Apple TV/FM Radio System and certain other accessories)

Display support

=====

- * 1 MB of video RAM
- * 16-bit color for display of up to 32,768 colors on monitors using 640- by 480-pixel or 800- by 600-pixel resolution
- * 8-bit color for display of 256 colors on monitors using 832- by 624-pixel or 1,024- by 768-pixel resolution

Electrical requirements and compliance

=====

- * Line voltage: 100 to 125/200 to 240 V AC, RMS, single phase
- * Frequency: 47 to 63 Hz
- * Power: 220 W maximum (continuous)
- * Energy-saving sleep mode

Size and weight

=====

- * Height: 16.0 in. (40.6 cm)
- * Width: 7.8 in. (19.8 cm)
- * Depth: 16.9 in. (42.8 cm)
- * Weight: 44.5 lb. (20.18 kg)

Operating environment

=====

- * Operating temperature: 50 to 97 degrees F (10 to 35 degrees C)
- * Storage temperature: -40 to 116.6 degrees F (-40 to 47 degrees C)
- * Relative humidity: 5% to 95% noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Disability access

=====

- * CloseView software magnifies screen image up to 16 times
- * Easy Access software permits combination keys to be pressed sequentially and enables cursor control from the numeric keypad instead of the mouse
- * "Visual beep" replaces audible system alerts

Article Change History:

- 11 Nov 1996 - Removed reference to built-in Ethernet.
- 31 Oct 1996 - Changed distribution status.

Power Macintosh 5400/180: Specifications (11/96)

Revised: 11/15/96
Security: Everyone

Power Macintosh 5400/180: Specifications (11/96)

Article Created: 25 September 1996
Article Reviewed/Updated: 15 November 1996

TOPIC -----

This article contains the technical specifications for the Power Macintosh 5400/180 computer.

DISCUSSION -----

Microprocessor

=====

- * PowerPC 603e processor running at 180 MHz
- * 32K internal cache
- * Integrated floating-point unit
- * 64-bit memory bus
- * Optional High Performance Module (256K level 2 cache)

Memory

=====

- * Two DIMM expansion slots
- * Comes with 16 MB of RAM (uses one DIMM socket)
- * Can be expanded to 136 MB using two 64 MB DIMMs
- * Uses 64-bit-wide, 168-pin, 70-nanosecond or faster, fast-paged-mode DIMMs (1K or 2K refresh rate)

Disk drives

=====

- * Internal 1.6GB hard disk drive
- * Internal Apple SuperDrive floppy disk drive
 - Uses high-density, 1.4MB floppy disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks

Display

=====

Built-in display

- * 15-in. RGB color display (12.8-in. diagonal viewable image size)
- * 0.28-mm dot pitch
- * Noninterlaced, flat, square cathode-ray tube (CRT)
- * User-adjustable resolutions from 640 by 480 pixels to 832 by 624 pixels
- * Resolution can be changed without restarting the computer
- * Refresh rate up to 75 Hz
- * Built-in base tilts from -5° to +15°, swivels a full 360°
- * Meets SWEDAC MPR2 international guidelines for magnetic-field emissions

Display support

- * 16-bit color for display of up to 32,768 colors at 640- by 480-pixel or 800- by 600-pixel resolution
- * 8-bit color for display of 256 colors at 832- by 624-pixel resolution
- * 1 MB video frame buffer (independent of system RAM)

Sound

=====

- * Stereo 16-bit sound
- * Apple sound enhancements, including SRS 3D surround sound
- * Built-in stereo speakers
- * Built-in microphone
- * Sound-output port
- * Sound-input port
- * Front headphone jack and volume control

Expansion interfaces

=====

- * 10BASE-T Ethernet connector
- * PCI expansion slot for industry-standard 6.88-in., 15-watt expansion cards
- * Apple Desktop Bus port for mouse, keyboard, and other devices (multiple devices can be connected to each other from one port)
- * RS-232/RS-422 serial port for an AppleTalk network connection, other networking connections, communications equipment (including GeoPort-compatible devices), or a printer
- * SCSI interface port for as many as six external SCSI devices, such as disk drives and/or CD-ROM drives
- * Communications slot (used by the built-in Ethernet connector)
- * TV/FM radio expansion bay
- * Video-output port for connection to an external monitor for video mirroring (also supports connection to an NTSC or PAL video-out interface box, such as the Apple Presentation System)
- * Video-input connector (Apple Video System) for receiving video input from a VCR, video camera, or other video equipment; supports both composite and S-video input

Note: The Apple Video System is only included with some configurations of the Power Macintosh 5400/180 computer.

Disability access

=====

- * CloseView software magnifies screen image up to 16 times
- * Easy Access software permits combination keys to be pressed sequentially and enables cursor control from the numeric keypad instead of the mouse
- * "Visual beep" replaces audible system alerts

Electrical requirements and compliance

=====

- * Line voltage: 110 to 240 V AC, RMS, single phase, nominal
- * Frequency: 50 to 60 Hz
- * Power: 220 W maximum (continuous)
- * Includes low-power sleep mode
- * U.S. EPA Energy Star compliant

Size and weight

=====

- * Height: 17.5 in. (44.5 cm)
- * Width: 15.1 in. (38.3 cm)
- * Depth: 16 in. (40.6 cm)
- * Weight: 47 lb. (21 kg)

Operating environment

=====

- * Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- * Storage temperature: -40 to 116 degrees F (-40 to 47 degrees C)
- * Relative humidity: 5% to 95%, noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Article Change History:

- 11 Nov 1996 - Clarified DIMM expansion slots.
- 31 Oct 1996 - Changed distribution status.

Power Macintosh 5400/180: Description (10/96)

Revised: 10/31/96
Security: Everyone

Power Macintosh 5400/180: Description (10/96)

=====

Article Created: 25 September 1996
Article Reviewed/Updated: 31 October 1996

TOPIC -----

This article contains the description for the Power Macintosh 5400/180 computer.

DISCUSSION -----

With its state-of-the-art RISC-based processor and advanced multimedia capability, the Apple Power Macintosh 5400/180 computer is ready to help you learn, create, and communicate.

The computer's 180-megahertz PowerPC 603e processor and 16 megabytes of RAM let you easily run an abundance of Macintosh applications--and there's plenty of room to store them on the 1.6-gigabyte internal hard drive.

The Power Macintosh 5400/180 includes multimedia features that are expensive add-ons with other computers, including a CD-ROM drive for multimedia applications and a 15-inch monitor (12.8-inch diagonal viewable image size) to display vibrant colors.

Using the Apple Video System (which is included with some configurations), you can view and record video from VCRs and video cameras. There's also a built-in microphone to directly record your own sounds.

Multimedia audio is made lifelike through the built-in stereo speakers enhanced by SRS 3D surround sound and the Macintosh 16-bit stereo sound system.

Built-in Ethernet connectivity lets you access the Internet--including the World Wide Web--through your local Ethernet network.

Compatibility with MS-DOS or Windows software-based computers is provided in several ways. You can share floppy disks and files by using Macintosh PC Exchange and Macintosh Easy Open software (both included). For the ultimate in

compatibility, Apple's optional PC Compatibility Card puts a 100-megahertz 586-class processor right in your computer.

If you need more capabilities in the future, expansion is easy through the industry-standard Peripheral Component Interconnect (PCI) slot and built-in SCSI support.

The Power Macintosh 5400/180: Performance and convenience for learning, creating, and communicating.

Features

=====

High performance

- * PowerPC 603e processor running at 180 MHz
- * 16 MB of RAM
- * 1.6 GB hard disk drive

Multimedia

- * Multiple-scan 15-inch color display (12.8-inch diagonal viewable image size)
- * Built-in 8x-speed, tray-loading CD-ROM drive
- * CD-quality digital sound with SRS 3D surround sound
- * Front-panel volume control and headphone/speaker jack
- * Apple Video System for video input (included with some configurations)

Connectivity and expandability

- * Ethernet network connector
- * PCI expansion slot
- * SCSI interface
- * Serial port

Features Built Into Every Power Macintosh

=====

Fast, easy setup

- * Simple to set up and learn; your system is ready to go the first time you turn it on

System 7.5 software

- * Apple Guide software for step-by-step help with basic system operation
- * QuickTime multimedia software
- * Macintosh PC Exchange software

Communications

- * GeoPort- and LocalTalk-compatible serial ports
- * Built-in AppleTalk networking
- * File sharing without a dedicated server

Ordering Information

=====

Power Macintosh 5400/180

Order No. M5162LL/A

Computer with built-in multiple-scan 15-inch display (12.8-inch diagonal viewable image size), 1.6GB hard disk, 8x-speed CD-ROM drive, floppy disk drive, and Apple Video System. Mouse, keyboard, and cables also included.

Note: This configuration is available to K-12 educational institutions only.

Power Macintosh 5400/180

Order No. M5161LL/A

Computer with built-in multiple-scan 15-inch display (12.8-inch diagonal viewable image size), 1.6GB hard disk, 8x-speed CD-ROM drive, and floppy disk drive. Mouse, keyboard, and cables also included.

Note: This configuration is available through the Educator Advantage program.

Optional Enhancements

* High Performance Module
(256K level 2 cache)

Order No. M4505LL/A

* Apple Video System

Order No. M2894LL/D

* Apple TV/FM Radio System

Order No. M4586LL/A

(Requires the Apple Video System, which is included with M5162LL/A)

* PC Compatibility Card
(with 586-class processor)

Order No. M4091LL/B

* Avid Cinema

Order No. M4561LL/A

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

AppleCD Drives: Some Corel Titles Contain Old Drivers (9/96)

Revised: 9/27/96
Security: Everyone

AppleCD Drives: Some Corel Titles Contain Old Drivers (9/96)

=====

Article Created: 27 September 1996

TOPIC -----

I have some Corel software that is on a CD Plus format CD-ROM disc, and it will not read consistently. I have also tried two other CD+ CD-ROM discs, and they have not worked consistently either. I have talked to the technical support staff at Corel, and they claim this is a known issue with the Matsushita quad-speed CD drive that is in the newer Power Macintosh computers. Is this really the problem?

DISCUSSION -----

The Corel Drivers for Enhanced CD that come with the Bob Dylan's Greatest Hits Volume 3 are intended for non-Apple CD-ROM drives. The Corel CD contains a multimedia update, which is the Apple Multimedia Tuner used prior to QuickTime 2.1 to fix some older problems in QuickTime 2.0, and is unrelated to CD Plus discs. This should not be installed. The Corel CD also contains Apple's CD-ROM Setup 5.1.1. This driver should also not be used, and instead you should get CD-ROM Setup 5.1.2 from Apple SW Updates.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

PowerBook 1400 Series: Description (4/97)

Article Created: 27 September 1996
Article Reviewed/Updated: 09 Apr 1997

TOPIC -----

This article contains a description of the Macintosh PowerBook 1400 family (1400c/117, 1400cs/117, and 1400c/133) computers.

DISCUSSION -----

Overview
=====

The Apple Macintosh PowerBook 1400cs/117 and 1400c/117 take Apple's traditional strengths - excellence in design and unparalleled ease of use - to a new level by incorporating the latest advances in portable computing technology. These powerful, innovative notebook computers are designed to suit your lifestyle and reflect your personality. They go beyond the expected, providing a variety of expansion capabilities and featuring a stylish new design.

Based on the PowerPC 603e processor (117- or 133-megahertz), the Apple Macintosh PowerBook 1400 computers can handle everything from complex spreadsheets to text- and graphics-intensive reports. They feature a removable, modular 6x-speed CD-ROM drive (standard on most configurations), giving you access to the wealth of resources available on CD, including the latest business productivity soft-ware and multimedia games. And their 11.3-inch color SVGA displays (dual-scan for the 1400cs/117; active-matrix for the 1400c/117, and 1400c/133) provide outstanding quality and bright, vivid colors, as well as ample room for viewing your work - or play.

Designed to be "portables with personality," these computers reflect the style and individuality that characterize users of PowerBook systems. They feature a clear exterior panel called a BookCover, which lets you personalize the appearance of your PowerBook with colorful, interchangeable inserts. They also sport a sleek new contoured design, including a flip-up keyboard that makes it easy to access the system's interior for upgrades or service. And all the

PowerBook 1400 systems support a variety of expansion options. For example, there's a memory expansion slot that allows you to "piggy-back" memory cards to protect your investment in additional RAM, as well as an internal expansion slot that you can use to add capabilities such as Ethernet networking or video out.

To get you started working right away, the PowerBook PowerBook 1400cs/117, 1400c/117, and 1400c/133 come bundled with ClarisWorks and Claris Organizer, as well as remote access and cross-platform compatibility software. They even include the Apple Internet Connection Kit.

So if you want an innovative design, unparalleled ease of use, and unmatched opportunities for customization, the Macintosh PowerBook 1400 family is bound to be the right choice for you.

Features

=====

Powerful technology

- * Uses the PowerPC 603e processor
- * Includes a 6x-speed CD-ROM drive (standard on most configurations)
- * Provides a large, 11.3-in. (diagonal) color SVGA display (dual-scan or active-matrix) supporting thousands of colors
- * Features an advanced Apple trackpad with tap, double-tap, and drag functionality
- * Comes with built-in infrared technology for easy, wireless file sharing with similarly equipped systems

Innovative design

- * Features a sleek, contoured shape, and a variety of BookCover inserts that let you personalize the appearance of your PowerBook computer
- * Lets you flip the keyboard forward for easy upgradability and service

Upgradability and expandability

- * Offers a memory expansion slot that allows "piggy-backing" of memory cards, so you can install one card initially and then install another later, thus protecting your investment
- * Includes PC Card slots for two Type II PC Cards or one Type III PC Card
- * Features an expansion bay for a floppy disk drive, CD-ROM drive, battery storage, or third-party solutions such as a second hard disk drive, magneto-optical drive, or Zip drive
- * Provides an internal expansion slot for built-in Ethernet or video-out cards

A complete solution

- * Includes everything you need to be productive right away, right out of the box
- * Comes with productivity software, including ClarisWorks and Claris Organizer
- * Comes with Apple Internet Connection Kit software, including Netscape Navigator, Claris EMailer Lite, Fetch, NCSA Telnet, and NewsWatcher

..TIL20468-PowerBook_1400_Series-Description_4-97.pdf

- * Includes software for remote access and cross-platform compatibility

Ordering Information

=====

Macintosh PowerBook 1400cs/117

Order No. M5287

- * PowerBook 1400cs/117 computer with 12 MB of RAM, built-in 1.4 MB Apple SuperDrive, and internal 750 MB hard disk drive
- * 11.3-inch dual-scan display
- * NiMH battery and AC adapter
- * Mac OS system software
- * Complete setup, learning, and reference documentation
- * ClarisWorks and Claris Organizer software and documentation
- * Apple Internet Connection Kit software
- * Apple Remote Access and cross-platform compatibility software
- * Limited warranty

Macintosh PowerBook 1400cs/117

Order No. M5292

- * Same as Order No. M5287 but with 16 MB of RAM and a 6x-speed CD-ROM drive.

Macintosh PowerBook 1400c/117

Order No. M4856

- * PowerBook 1400c/117 computer with 16 MB of RAM, built-in 1.4 MB Apple SuperDrive, internal 1 GB hard disk drive, and 6x-speed CD-ROM drive (battery, adapter, system software, additional software, documentation, and warranty same as Order No. M5287)
- * 11.3-active-matrix display

Macintosh PowerBook 1400c/133

Order No. M5576

- * Same as Order No. M4586 but with 133-MHz PowerPC 603e with 128K level 2 cache

Macintosh PowerBook 6x-Speed CD-ROM Module

Order No. M4508

Macintosh PowerBook 8-bit Color Video-out Upgrade Kit

Order No. M4509

- * This upgrade has 512K VRAM and ships with the external video adapter cable.

Macintosh PowerBook AC Adapter

Order No. M4895

Macintosh PowerBook Rechargeable Battery

Order No. M4507

Macintosh PowerBook 8 MB Memory Expansion Card

Order No. M4506

PowerBook 1400 Series: Technical Specifications (4/97)

=====

Article Created: 27 September 1996
Article Reviewed/Updated: 09 April 97

TOPIC -----

This article contains a list of technical specifications for the Macintosh PowerBook 1400 family (1400c/117, 1400cs/117, and 1400c/133) computers.

DISCUSSION -----

Microprocessor

-
- * 117-MHz PowerPC 603e
or 133-MHz PowerPC 603e with 128K level 2 cache Memory

Memory

-
- * 12 MB or 16 MB of RAM, expandable to 64 MB (expansion via Customer RAM slot)
(12 MB = 8 MB soldered on logic board, 4 MB in Apple Factory RAM slot)
(16 MB = 8 MB soldered on logic board, 8 MB in Apple Factory RAM slot)

Storage

-
- * Built-in 1.4 MB Apple SuperDrive floppy disk drive uses high-density floppy disks and reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
 - * Internal 750 MB or 1 GB hard disk drive
 - * Sleep-swappable 6x-speed CD-ROM drive module (CD-ROM also available for separate purchase for M5287 model)

Display

-
- * 11.3-in. (diagonal) dual-scan (1400cs/117)
or active-matrix (1400c/117 and 1400c/133) color SVGA display,
thousands of colors
 - * Resolution: 800 by 600 pixels

Expansion capabilities

- * Memory expansion slot that allows "piggy-backing" of up to two memory cards
- * Expansion bay for Apple and third-party solutions such as an additional hard disk drive, magneto-optical drive, or Zip drive
- * Internal expansion slot for video-out or Ethernet cards

PC Card slots (PCMCIA)

- * Includes two PC Card slots that can accommodate two Type II PC Cards or one Type III PC Card
- * Support for industry-standard cards such as Ethernet networking, a wired or wireless modem, storage, or other capabilities

Battery

- * 30 watt-hour nickel-metal-hydride (NiMH)
- * Average life: 2 to 4 hours, depending on usage and configuration

Ports

- * Apple Desktop Bus (ADB) port
- * Serial (RS-422) port
- * SCSI port for connecting as many as six external devices
- * Power adapter port
- * Stereo sound-input port
- * Stereo sound-output port

Networking

- * Built-in LocalTalk port
- * Built-in infrared technology supports AppleTalk protocols

Built-in stereo sound

- * 16-bit, CD-quality stereo sound capable of driving headphones or external speakers
- * Built-in speaker and integrated microphone
- * Digital-to-analog conversion sampled at 44.1, 22.05, or 11.025 kHz
- * 16-bit audio line-in for recording

Security

- * Security slot for locking (requires third-party cable)
- * Password security software

Keyboard

- * Built-in full-size keyboard with 76 (U.S.) or 77 (ISO) keys, including 12 function keys and an integrated palm rest

Apple trackpad

* Solid-state Apple trackpad provides precise cursor control in response to the movement of the user's fingertip over its surface; sensing of movement and acceleration can be easily adjusted through a control panel; supports tap, double-tap, and drag capabilities

Disability access

* System software includes Easy Access and ability to substitute visual cue for beep. These built-in solutions and third-party options provide alternative input and output solutions for people with disabilities.

Electrical requirements

- * Line voltage: 100 to 220 volts AC
- * Frequency: 50 to 60 Hz

Environmental requirements

- * Operating temperature: 41 degrees to 95 degrees F
(5 degrees to 35 degrees C)
- * Storage temperature: 14 degrees to 140 degrees F
(-10 degrees to 60 degrees C)
- * Relative humidity: 20% to 80% noncondensing
- * Operating altitude: 0 to 10,000 ft. (0 to 3,048 m)
- * Maximum storage altitude: 15,000 ft. (4,722 m)

Size and weight

- * Height: 2.0 in. (5.2 cm)
- * Width: 11.5 in. (29.2 cm)
- * Depth: 9.0 in. (22.5 cm)
- * Weight:
 - * Macintosh PowerBook 1400cs/117:
 - 6.7 lb. (3.0 kg) (with floppy disk drive installed);
 - 7.07 lb. (3.17 kg) (with CD-ROM drive installed)
 - * Macintosh PowerBook 1400c/117 or 1400c/133:
 - 6.6 lb. (3.0 kg) (with floppy disk drive installed);
 - 6.97 lb. (3.17 kg)
(with CD-ROM drive installed)

Workgroup Servers: System 7.5.5 Isn't Supported (10/96)

=====

Article Created: 27 September 1996
Article Reviewed/Updated: 3 October 1996

TOPIC -----

Is System 7.5.5 supported on Workgroup Servers?

DISCUSSION -----

As of September 1996, System 7.5.5 has not been qualified on any Workgroup Server and is not supported at this time.

Engineering is in the process of determining if the System 7.5.5 release will be supported and/or qualified with server products. Testing completion date is to be determined.

Geoport Telecom Adapter Kit: Description (10/96)

Article Created: 27 September 1996
Article Reviewed/Updated: 18 October 1996

TOPIC -----

This article contains a description of the Geoport Telecom Adapter Kit.

DISCUSSION -----

Overview
=====

Communications and collaboration are central to human interaction. Today, people rely on the telephone to talk to each other, to send faxes and electronic mail, and to access online information services. And the GeoPort Telecom Adapter II, Apple Telecom 3.0 software, and other software included in the GeoPort Telecom Adapter Kit – in conjunction with an analog telephone line – provide an all-in-one solution to handle all of these vital functions.

An inexpensive communications device, the GeoPort Telecom Adapter II takes advantage of Apple's GeoPort architecture and the Macintosh Telephony Architecture (MTA) to turn your Power Macintosh into a high-speed modem, intelligent telephone, digital answering machine, and fax. So you can handle all of your communications and collaboration needs right from your desktop—easily and intuitively.

The screen-based telephone application is even easier to use than your phone. As a full-duplex speakerphone, it allows you to have natural conversations—unlike conventional speakerphones that allow only one caller to speak at a time—and delivers high-quality sound. It comes with intelligent dialing and call logging to make dialing calls effortless and allow you to manage and streamline your communications. The digital answering machine software takes advantage of the intelligent answering capability of Apple Telecom 3.0, which allows a single line to support voice, fax, and modem use. And perhaps most important, the software supports telephony Apple events, so you can integrate off-the-shelf telephony-aware applications using AppleScript software to create your own

custom solutions.

The fax application includes OCR software, making it easy to convert faxed material into text, to be saved or pasted into any document and forwarded via any means. And the communications application lets you access information services such as commercial online bulletin boards or the Internet.

Speed, convenience, and integration—the GeoPort Telecom Adapter Kit brings it all to desktop communications and collaboration, making it easier than ever to stay informed and in touch.

Features

=====

Screen-based telephone

- Provides full-duplex speakerphone function
- Automates telephone dialing with Apple Phone software and Apple Address Book entries
- Supports character dialing, intelligent dialing, and call logging

Digital answering machine

- Supports high-quality sound
- Provides intelligent auto-answer that directs between voice, fax, and modem calls
- Allows you to record and store multiple greetings and create multiple mailboxes
- Provides remote access to voice mail and voice-mail navigation

Fax/Modem

- Offers full fax functionality at 14.4 Kbit/s (V.17)
- Supports high-speed modem functionality at up to 28.8 Kbit/s (V.34)
- Includes OCR capability, fast printing, and QuickDraw GX compatibility

Macintosh Telephony Architecture (MTA)

- Supports a single phone line for voice, fax, and data use
- Supports audio recording and playback through Telephone Manager 3.0 system software
- Supports AppleScript (including telephony Apple events) for the creation of customized solutions with many off-the-shelf applications

Geoport Telecom Adapter Kit: Technical Specifications (10/96)

Article Created: 27 September 1996
Article Reviewed/Updated: 27 November 1996

TOPIC -----

This article contains a list of technical specifications for the Geoport Telecom Adapter Kit.

DISCUSSION -----

Technical Specifications
=====

Power requirements

- The GeoPort Telecom Adapter II operates from the computer's power via an extra line on the cable that connects the adapter to the computer. A separate power supply or battery is not needed.

Environmental requirements

- Operating temperature: 50 degrees to 104 degrees F
(10 degrees to 40 degrees C)
- Storage temperature: -40 degrees to 149 degrees F
(-40 degrees to 65 degrees C)
- Relative humidity: 20 percent to 90 percent noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Size and weight

- Height: 1.5 in. (3.8 cm)
- Width: 2.8 in. (7.1 cm)
- Depth: 5.7 in. (14.5 cm) for pod;
7.7 in. (19.6 cm) for pod and standoff
- Weight: 0.46 lb. (0.21 kg) for pod;
0.67 lb. (0.30 kg) for pod and cable

General telephone

- Single phone line for voice, fax, and data
- Dialing capability
 - Tone/pulse dialing
 - Auto or manual dialing and answering
- Voice features
 - Record from phone line
 - Play audio to phone line
 - Real-time audio supports full-duplex speakerphone

Fax

- Group 3 fax communication standards
 - CCITT V.27ter: 2400, 4800 bps
 - CCITT V.29: 7200, 9600 bps
 - CCITT V.17: 12,000; 14,400 bps
- Error control
 - Fax error correction mode (ECM)

Modem

- Data communication standards
 - CCITT V.34: 28,800; 26,400; 24,000; 21,600; 19,200; 14,400; 12,000; 9600; 7200; 4800 bps
 - V.32bis: 14,400; 12,000; 9600; 7200; 4800 bps
 - CCITT V.32: 9600; 4800 bps
 - CCITT V.22 bis: 2400 bps
 - Bell 212A: 1200 bps
 - CCITT V.22: 1200 bps
 - CCITT V.23: 1200/75 bps
 - CCITT V.23: 75/1200 bps
 - CCITT V.21: 300 bps
 - Bell 103: 300 bps
- Error correction and data compression
 - Full CCITT V.42/V.42bis compliance
 - MNP classes 2-5
- Data transmission and format
 - Full- or half-duplex operation
 - Asynchronous or framed modes
- Character formats
 - 5, 6, 7, 8 data bits
 - 1 or 2 stop bits
 - Odd, even, or no parity

System requirements

- Any Power Macintosh or PowerPC processor-based Macintosh Performa computer except for the 5200, 5300, 6200, and 6300 series.
- Macintosh system software version 7.1.2 or later (System 7.5 or later is recommended)

QuickTime For Windows 2.1.2: What It Fixes (9/96)

=====

Article Created: 27 September 1996

TOPIC -----

This article lists changes that were implemented in version 2.1.2 of QuickTime for Windows.

DISCUSSION -----

The following changes are included in QuickTime for Windows 2.1.2. Additional information about QuickTime products for Macintosh and Windows can be found on the worldwide web at:

<http://quicktime.apple.com>

1. Cirrus component workaround for QTVRW bug that caused crashes.
2. Fixed DHIO_DH problem with multiple applications playing movies simultaneously.
3. Got rid of "Library not freed ... call Microsoft" error message. Problem remains.
4. Added GetMediaSampleReference API.
5. Fixed "MC paints once at (0,0), then correctly positions movie."
6. Fixed problem opening multiple movies via MCI.
7. Fixed confusing "Invalid Data Reference" message from Movie Player.
8. Several fixes to Player and Viewer command line parsing.
9. Fixed bug in Cinepak 0.5x blits to hard-banked displays.
10. Fixed longstanding bug in sound rate resampling to rates > 32767.

11. Replaced sample movie with calibration step in installer (32-bit now does it, too).
12. Updated disk space requirements in installer.
13. Fixed installer bug where it was deleting the installed copy of itself in some instances.
14. Installer no longer fails if temp directory already exists.
15. Control panel/installer updated for better control of automatic audio rate adjustment.
16. Fixed "intermittent garbage" bug in 32-bit QTW's IMA audio playback.
17. Fixed "non-1.0 rate playback plays audio at 1.0 rate" bug.
18. Fixed GetTrackEnabled (it was returning bogus values).
19. Rebased all 32-bit DLLs to speed up load time.
20. QTVHDW/DCI workaround for QTVRW bug that caused control panel crashes.
21. Fixed the infamous "DCIMAN.DLL" error message.
22. QTVHDW and DCI32 workarounds for 2 separate S3 Trio 64 DCI provider bugs.
23. Fixed automatic audio rate adjustment to deal with instability due to excessive interrupt activity.
24. Fixed a crash opening sprite movies (sprites are not yet supported in QTW).

Multimedia Learning Tools Bundle: Description (10/96)

Article Created: 27 September 1996
Article Reviewed/Updated: 30 October 1996

TOPIC -----

This article contains the description for the Apple Education Series: Multimedia Learning Tools Bundle.

DISCUSSION -----

Since the introduction of HyperCard in 1987, innovative educators nationwide have been pairing computers with multimedia resources to give their students new tools for collecting, synthesizing, and communicating information. Now Apple has made that easier to do.

Apple Education Series: Multimedia Learning Tools Bundle consists of a Macintosh computer and the Multimedia Learning Tools Kit--a collection of carefully selected authoring and design tools, multimedia resources, and guides for using these tools in teaching and learning. Especially useful are the multimedia project lessons--teacher-developed, interdisciplinary lessons designed to help students get started creating their own multimedia projects.

Teachers have always known that students learn best when they're actively engaged. And, aware that multimedia offers many such opportunities, teachers have been bringing an increasing number of multimedia-based educational resources into their classrooms.

But teachers also know that the connections students make on their own are the most meaningful and lasting. So, to take further advantage of the strengths of multimedia, many teachers are now providing multimedia authoring tools for their students--helping them to use these engaging resources for their own knowledge construction. The thousands of student multimedia projects already developed in classrooms--and the tens of thousands of learning connections they exemplify--testify to the importance of that effort.

Whether you're just getting started with integrating student-centered multimedia

projects into the curriculum or want to add resources to an existing multimedia environment, the Multimedia Learning Tools Kit is the perfect choice.

More Choices, More Flexibility

=====

Now, when you order a Macintosh computer with the Multimedia Learning Tools Kit, you may also order two other Apple Education Series kits.

It's as easy as 1-2-3.

1. Select a computer. Order the featured solution--which includes a Power Macintosh 5260/120 and the kit--or choose one of the other computers listed below and order the computer and kit separately. Refer to the computer data sheets for more details.

2. Choose two other kits. If you wish to order additional Apple Education Series kits, you can find out what's available on the Education Price List and review the contents on their respective data sheets.

3. Purchase everything at once. The Macintosh computer and up to three kits must all appear on the same purchase order.

Computer Options

=====

Power Macintosh 5260/120 (featured computer)

Equipped with 16 MB of RAM, built-in 14-inch color display, 1.2 GB hard disk drive, 8x-speed CD-ROM drive, stereo speakers and microphone, AppleDesign Keyboard, and mouse.

Power Macintosh 5400/180

Equipped with 16 MB of RAM, built-in tilt-and-swivel 15-inch color multiple-scan display, 1.2 GB hard disk drive, 8x-speed CD-ROM drive, Ethernet networking, video-input/output, stereo speakers and microphone, AppleDesign Keyboard, and mouse; includes a PCI expansion slot.

Power Macintosh 6400/200

Equipped with 16 MB of RAM, 256K level 2 cache, 2.4 GB hard disk drive, 8x-speed CD-ROM drive, Ethernet network-ing, microphone, AppleDesign Keyboard, and mouse; includes two 7-inch PCI expansion slots; supports 16-bit color for display of up to 32,768 colors on a variety of monitors. (Monitor is sold separately.)

Multimedia Learning Tools Kit

=====

* Add Motion from Motion Works

* Apple Font Pack from Apple Computer, Inc.

* ClarisImpact from Claris Corporation

An integrated productivity application that provides tools for creating drawings, reports, and presentations. Students can use it to plan and manage the

development of multimedia projects, as well as to create presentations that include photos, movies, text, charts, and graphics.

* Color It! from MicroFrontier

A 32-bit color paint and image-editing program that allows students to create and enhance photographic and other images. Includes multiple Undos and tools for masking.

* Famous Faces from Jasmine Multimedia Publishing

QuickTime movies of 100 inventors, politicians, celebrities, artists, and business and religious leaders. Also includes text-based biographies and quotations.

* HyperCard from Apple Computer, Inc.

A flexible and powerful tool for creating multimedia projects that include text, sound, pictures, animations, and movie clips. HyperCard now has automated scripting as well as HyperTalk(r) and AppleScript(r) , powerful programming languages that students can use to augment the built-in HyperCard features. Includes Multimedia Utilities.

* HyperStudio from Roger Wagner Publishing, Inc.

An easy-to-use and powerful multimedia authoring tool. Students can easily import and integrate movies, sounds, text, and graphics to create multimedia projects. They can record and edit QuickTime(r) movies and connect to the Internet. Also includes more than 250 megabytes of pictures, animations, and sounds.

* Kid Pix Studio from Brøderbund Software, Inc.

A multimedia authoring tool designed especially for young children. With Kid Pix Studio, students can paint pictures, create animations, stage digital puppet shows, or record their voices--and then produce a multimedia slide show that integrates all of these elements.

* MacGALLERY from DreamMaker Software

A collection of more than 25,000 clip-art images that students can place in their projects.

* MediaClips from SoftKey Multimedia Inc.

Six collections--Animal Kingdom, Tropical Rain Forest, Deep Voyage, American View, and World View--consisting of hundreds of photographs, music clips, and movies, for students to save and include in their multimedia projects.

* MultiWare Multi-Media Collection from BeachWare

A collection of more than 250 megabytes of pictures, QuickTime movies, color buttons, music, and sound effects.

* QuickTime Extras from Apple Computer, Inc.

* Multimedia Utilities from Motion Tool Works (USA) Corporation

A collection of six utilities to record the computer screen as a movie, build an animation, construct an interactive QuickTime movie, edit a movie, transform one still image to another, and capture and edit a sound.

..TIL20474-Multimedia_Learning_Tools_Bundle-Description_10-96.pdf

* TIME Magazine Multimedia Almanac from SoftKey International, Inc.

Contains a selection of fully indexed Time magazine articles from the past 70 years with photos, videos, charts, maps, source materials, and directories that students can place in their projects.

* Videoshop from Strata

* Virtus VR from Virtus Corporation

An entry-level 3D virtual reality design tool. Students can use it to build 3D scenes that illustrate their multimedia projects. Then with an authoring tool they can connect the scenes to their projects. Also included are Virtus Player and Virtus Galleries: Archaeology

Curriculum and Other Materials

=====

Multimedia Learning Tools Teacher's Guide

A comprehensive guide that tells how to get started with the Macintosh, describes each of the software programs, and explains the value of multimedia in education. At the heart of the guide is a collection of 12 multimedia project lessons. These teacher-developed lessons are designed to help students in grades K-12 get started creating their own multimedia projects--using the specific tools and resources included in the bundle. Also includes 12 single-task activity cards to help with the technical aspects of multimedia authoring.

Multimedia Flying Solo

From Thomson Learning TOOLS. A step-by-step book that covers the basics of HyperCard 2.3. Includes the MultiWare Multi-Media Collection CD-ROM.

Multimedia and Learning: A School Leader's Guide

From the National School Boards Association. This book contains articles written by experts in the field of multimedia authoring for education. Software Documentation Guides and manuals for the software in the solution kit.

Teacher Solution Bundle: Description (10/96)

Article Created: 27 September 1996
Article Reviewed/Updated: 30 October 1996

TOPIC -----

This article contains a description of the Apple Education Series: Teacher Solution Bundle.

DISCUSSION -----

When schools put computers on their teachers' desktops, the teachers and students both benefit. Now Apple has made that easier to do.

With the Teacher Solution Bundle, teachers have access to a powerful Macintosh computer and the Teacher Solution Kit--some of the most useful software available, including a graphics and presentation package, a word processor, and a grading and attendance program.

Administrators in California's Corona-Norco Unified School District, not satisfied with anecdotal reports, conducted a nine-month research project to determine the impact of putting Macintosh computers on teachers' desktops. The result? They discovered that by adding technology, they dramatically increased the amount of time available for classroom instruction.

Focusing on tasks such as taking attendance, planning lessons, developing tests, and reporting grades, the researchers found that the 28 K-6 teachers in the study saved, on average, 36 minutes a day. According to Tom Wilson, the district's director of educational technology, "The research showed that an effective application of technological tools improves an educator's level of productivity, and consequently, increases his or her teaching time in class." Adds Wilson, "The kids are the ultimate beneficiaries."

More Choices, More Flexibility

Now, when you order a Macintosh computer with the Teacher Solution Kit, you may also order two other Apple Education Series kits.

It's as easy as 1-2-3.

1. Select a computer. Order the featured solution--which includes a Power Macintosh® 5260/120 and the kit--or choose one of the other computers listed below and order the computer and kit separately. Refer to the computer data sheets for more details. Refer to the computer data sheets for more details.
2. Choose two other kits. If you wish to order additional Apple Education Series kits, you can find out what's available on the Education Price List and review the contents on their respective data sheets.
3. Purchase everything at once. The Macintosh computer and up to three kits must all appear on the same purchase order.

Computer Options

(Monitor is sold separately.)

Teacher Solution Kit

=====

* ClarisWorks from Claris Corporation

Combines word processing, database, spreadsheet, graphics, presentation, and communications software in one familiar, efficient environment.

* ClarisWorks for Teachers from Claris Corporation

Offers a convenient collection of templates for the most commonly used reports, schedules, evaluations, lists, newsletters, and presentations.

* Classroom Clips from Creative Pursuits

Provides more than 850 color graphics for all school subjects in the K-12 curriculum. Includes categories such as endangered species, holidays, sports, history, literature, and musical instruments.

* Digital Chisel from Pierian Spring Software

..TIL20475-Teacher_Solution_Bundle-Description_10-96.pdf

Enables teachers and students to create interactive multimedia presentations, storybooks, or reports. Supports QuickTime movies, sound, and animation as well as painting and drawing tools.

* Easy Grade Pro from Orbis Software

Provides grading, attendance, seating, analysis and reporting tools for teachers. Offers 18 different grading reports.

* Grolier Multimedia Encyclopedia from Mindscape, Inc.

Combines the resources of a 21-volume encyclopedia with the impact of video and animation. Includes sophisticated hypertext searching tools, allowing students to explore ideas by linking words across cultures and time. Contains pictures, video clips, sounds, maps, and speeches.

* MakeTest from Mountain Lake Software, Inc.

Makes it easy to create and print question files and tests. Files your test items for future use.

* Microsoft Bookshelf from Microsoft Corporation

Provides encyclopedias, a dictionary, a thesaurus, an almanac, quotations, and an atlas. Offers a wide variety of pictures and text that you can copy and paste into other documents.

* Orchestrator from Media Seek Technologies

Provides a personal information manager designed for teachers, a syllabus manager, and a lesson planner.

* Scholastic SuperPrint for the Macintosh from Scholastic Inc.

Enables teachers and students to create full-color posters, banners, big books, cards, and calendars combining text, graphics, and artwork. Its interface is easy to use, even for the youngest students.

* TIME Magazine Multimedia Almanac from SoftKey International, Inc.

Contains a selection of fully indexed Time magazine articles from the past 70 years. Includes photos, videos, charts, maps, source materials, and directories that students can place in their projects.

* TimeLiner from Tom Snyder Productions

Enables teachers and students to create time lines that represent sequences of events or relationships between items such as time, size, weight, speed, distance, and temperature. Includes formats for printing long banners, single sheets, or posters. Also includes two data disks: American History and Dinosaurs and Other Big Stuff.

Writing and Publishing Tools Bundle: Description (10/96)

=====

Article Created: 27 September 1996
Article Reviewed/Updated: 30 October 1996

TOPIC -----

This article contains the description for the Apple Education Series: Elementary Curriculum Connections Bundle.

DISCUSSION -----

The Writing and Publishing Tools Bundle combines Power Macintosh 5260/120 or 5400/180 computers with the Writing and Publishing Tools Kit, a collection of writing and publishing software and teacher resources.

Teachers have always known that writing is central to students' efforts to organize and understand what they're learning. When students communicate what they know-- in written reports or presentations--they're reinforcing the knowledge they've gained. Because word processing has helped students produce better work, teachers are looking for more ways that computers can help develop communication skills. Now Apple has made that easier to do.

The Apple Education Series: Writing and Publishing Tools Bundle provides a Macintosh computer and the Writing and Publishing Tools Kit--a collection of software for facilitating writing, publishing, and presentation in any classroom. This software will help your students put their ideas into words--whether they're studying language and literature, science, mathematics, or history. A companion curriculum guide contains writing projects that can be tailored to a variety of curriculum areas.

This collection of resources provides tools for every stage of the writing process--from prewriting through publishing. And it encourages writers to go beyond traditional report writing by providing tools that facilitate collaborative writing, oral presentations, and multimedia-based projects.

Whether you're just getting started with computers for writing or are looking for new ways for your students to publish and present their work, the Writing

and Publishing Tools Kit is the perfect choice.

More Choices, More Flexibility

=====

Now, when you order a Macintosh computer with the Writing and Publishing Tools Kit, you may also order two other Apple Education Series kits.

It's as easy as 1-2-3.

1. Select a computer. Refer to the computer data sheets for more details.
2. Choose two other kits. If you wish to order additional Apple Education Series kits, you can find out what's available on the Education Price List and review the contents on their respective data sheets.
3. Purchase everything at once. The Macintosh computer and up to three kits must all appear on the same purchase order.

Computer Options

=====

Power Macintosh 5260/120 (featured computer)

Equipped with 16 MB of RAM, built-in 14-inch color display, 1.2 GB hard disk drive, 8x-speed CD-ROM drive, stereo speakers and microphone, AppleDesign Keyboard, and mouse.

Power Macintosh 5400/180

Equipped with 16 MB of RAM, built-in tilt-and-swivel 15-inch color multiple-scan display, 1.2 GB hard disk drive, 8x-speed CD-ROM drive, Ethernet networking, video-input/output, stereo speakers and microphone, AppleDesign Keyboard, and mouse; includes a PCI expansion slot.

(Monitor is sold separately.)

Writing and Publishing Tools Kit

=====

* American Heritage Dictionary from WordStar International

Combines the American Heritage Dictionary and Roget's II Thesaurus. Provides typical searching, anagrams, and alternate spellings.

* Aspects from Group Logic, Inc.

Facilitates collaborative writing, editing, and discussion--electronically.

Features a collaborative word processor that students on a classroom network can use to view and edit a document on a network. Requires LocalTalk Connector Kit.

* At Ease from Apple Computer, Inc.

Offers an easy-to-use alternative to the standard Macintosh security system and

..TIL20476-Writing_and_Publishing_Tools_Bundle-Description_10-96.pdf

user interface. Can assist with student portfolio management.

* Author's Toolkit from Sunburst Communications Inc.

Helps students learn to write well by guiding them through steps in the writing process. Useful for all types of writing--from letters and stories to plays and research reports. Uses PlainTalk for text-to-speech editing.

* ClarisImpact from Claris Corporation

Provides integrated and easy-to-use tools for creating drawings, reports, and presentations. Enables students and teachers to create outlines, tables, data charts, organization charts, time lines, calendars, and general graphics within any document.

* ClarisWorks from Claris Corporation

Combines word processing, database, spreadsheet, graphics, presentation, and communications software in one familiar, efficient environment. Provides drawing and painting tools, charts, and built-in calculations that students can use to create memos, newsletters, graphs, and reports. Uses PlainTalk for text-to-speech editing.

* The Copernicus Collection of Multimedia Images Volume 1 from Pierian Spring Software Provides more than 500 images that students can use when creating multimedia presentations.

* Correct Grammar from SoftKey International, Inc.

Enables students to correct grammar, usage, punctuation, style, and spelling errors in any word processing document. Also determines the readability level.

* Digital Chisel from Pierian Spring Software

Enables students and teachers to create interactive multimedia presentations, storybooks, or reports. Supports QuickTime movies, sound, and animation as well as painting and drawing tools.

* Key Into Spanish from Exceller Software Corporation

Provides instant translation between English and Spanish for any word typed at the keyboard. Includes a 30,000- word dictionary and an appendix of useful phrases and weights and measures. May be used with other applications to check spelling.

* MacLink Plus from DataViz

Converts files between Macintosh and PC formats as well as between different Macintosh formats.

* Media Weaver from Humanities Software

Facilitates students' use of multimedia and the writing process. Includes features that help teachers create exercises to encourage process writing. Provides a bilingual interface that supports writing in English and Spanish. Includes a library of art, photos, sounds, and movies. Uses PlainTalk for text-to-speech editing.

* TimeLiner from Tom Snyder Productions

Enables students to create time lines that represent sequences of events. Relationships between time, size, weight, speed, distance, and temperature can

also be sequenced. Prints long banners, single sheets, or posters.

* Write On! Sentences to Paragraphs II from Humanities Software
Offers practice in writing paragraphs that exhibit a strong topic sentence, supporting details, and a summary sentence. Reviews specific strategies such as narrowing a broad topic, ordering, adding supporting details, and linking sentences by example, cause and effect, comparison, and contrast.

* Write On! Paragraphs to Essays I from Humanities Software
Offers practice in writing strong paragraphs. Instruction begins with developing topic sentences that take students into main ideas, ordering, details, and summarizing--and all the way to short essays.

Curriculum and Other Materials

=====

Writing and Publishing Tools Curriculum Guide

This comprehensive teacher's guide tells how to get started with the Macintosh, describes each of the software programs, and explains how to start using them in the classroom. Five lessons on the writing process give teachers "basic recipes" for using the software tools to support each stage of the process. Nine broader projects--all adaptable for different content areas and grade levels--provide teachers with complete instructions for writing-related activities.

Secondary Reference Bundle: Description (10/96)

=====

Article Created: 27 September 1996
Article Reviewed/Updated: 30 October 1996

TOPIC -----

This article contains a description of the Apple Education Series: Secondary Reference Bundle.

DISCUSSION -----

The Apple Education Series: Secondary Reference Bundle provides a Macintosh computer and the Secondary Reference Kit--an extensive library of reference works on compact disc--to meet the research needs of middle and high school students. Along with traditional encyclopedias and an atlas--in multimedia versions that take full advantage of the technology--the kit also provides ample resources in art, science, history, and current events. For example, students will have immediate access to video clips of astronauts walking on the moon, collections of art from around the world, help in language learning, and more.

Today's students are thinking about the relationships among facts--instead of simply accumulating them. And one way they're doing this is by collaborating with others and communicating what they've learned. To facilitate that aspect of knowledge development, the Secondary Reference Kit also includes Digital Chisel, a multimedia authoring tool that enables students to communicate what they've learned by creating reports and presentations that can include pictures, video clips, and text.

The Secondary Reference Kit--the perfect complement for computers in middle and high school libraries, multimedia centers, classrooms, and labs.

More Choices, More Flexibility

=====

Now, when you order a Macintosh computer with the Secondary Reference Kit, you may also order two other Apple Education Series kits.

It's as easy as 1-2-3.

1. Select a computer. Order the featured solution--which includes a Power Macintosh® 5260/120 and the kit--or choose one of the other computers listed below and order the computer and kit separately. Refer to the computer data sheets for more details.
2. Choose two other kits. If you wish to order additional Apple Education Series kits, you can find out what's available on the Education Price List and review the contents on their respective data sheets.
3. Purchase everything at once. The Macintosh computer and up to three kits must all appear on the same purchase order.

Computer Options

=====

Power Macintosh 5260/120 (featured computer)

Equipped with 16 MB of RAM, built-in 14-inch color display, 1.2 GB hard disk drive, 8x-speed CD-ROM drive, stereo speakers and microphone, AppleDesign Keyboard, and mouse.

Power Macintosh 5400/180

Equipped with 16 MB of RAM, built-in tilt-and-swivel 15-inch color multiple-scan display, 1.2 GB hard disk drive, 8x-speed CD-ROM drive, Ethernet networking, video-input/output, stereo speakers and microphone, AppleDesign Keyboard, and mouse; includes a PCI expansion slot.

Power Macintosh 6400/200

Equipped with 16 MB of RAM, 256K level 2 cache, 2.4 GB hard disk drive, 8x-speed CD-ROM drive, Ethernet networking, microphone, AppleDesign Keyboard, and mouse; includes two 7-inch PCI expansion slots; supports 16-bit color for display of up to 32,768 colors on a variety of monitors. (Monitor is sold separately.)

Secondary Reference Kit

=====

* Artrageous from SoftKey International, Inc.

Enables students to learn about the effects of color, composition, light and perspective on paintings. Provides hundreds of paintings that students can examine and then alter--to see the impact of each effect. Includes a database on the artists and their paintings, and a reference section of art terms, definitions, and movements.

* Cartopedia from Dorling Kindersly Multimedia

Combines the cartographic qualities of an atlas with the background information of an encyclopedia and the statistical depth of a gazetteer. Includes detailed information on each of the world's 193 countries, data charts, graphics, diagrams, detailed maps, photos, and videos.

* CD Sourcebook of American History from Infobases, Inc.

Presents American history through the eyes of founders, colonists, presidents, pioneers, and others. Provides 20,000 pages of original source documents,

..TIL20477-Secondary_Reference_Bundle-Description_10-96.pdf

firsthand accounts, photographs, paintings, political cartoons, and more. Offers 10 multivolume histories including Autobiography of Benjamin Franklin, and Alexis DeTocqueville's Democracy in America.

* Digital Chisel from Pierian Spring Software

Enables students and teachers to create interactive multimedia presentations, storybooks, or reports. Supports QuickTime movies, sound, and animation as well as painting and drawing tools. Comes with a multimedia library that contains pictures, movies, and sounds.

* Eyewitness Encyclopedia of Science from Dorling Kindersley Multimedia

Covers topics in mathematics, physics, chemistry, and life sciences in a multimedia reference guide. Includes quizzes and specialized sections, such as a "who's who."

* Grolier Multimedia Encyclopedia from Mindscape, Inc.

Combines the resources of a 21-volume encyclopedia with the impact of video and animation. Includes sophisticated hypertext searching tools that allow students to explore ideas by linking words across cultures and time. Contains pictures, video clips, sounds, maps, and speeches.

* Our Times from Vicarious Software

Offers a multimedia encyclopedia that is based on information in the book Our Times: The Illustrated History of the 20th Century and on The Columbia Encyclopedia, Fifth Edition. Enables students to access all of the text from The Columbia Encyclopedia. Combines the elements of text, video, photographs and other images, and sound.

* RedShift from Maris Multimedia Ltd.

Provides a highly realistic three-dimensional simulation of space and the solar system. Allows students to view planets, moons, and stars--295,000 celestial objects in all--from any location inside the solar system. Facilitates the accurate simulation of a wide range of astronomical events.

* The Rosetta Stone PowerPac from Fairfield Language Technologies

Provides a unique multimedia tool for language learning. Combines real-life color images, the voices of native speakers, and written text. This special edition, with 22 chapters each of beginning French, Russian, Spanish, German, Dutch, and English, is taken from the award-winning 92-chapter Rosetta Stone Level I programs.

* 3D Atlas from Creative Wonders

Provides a three-dimensional interactive globe that allows students to explore geography from environmental, physical, and political points of view. Contains multimedia exhibits, short video documentaries, and time-lapse photography. Also includes a large array of statistics in categories from agriculture to transport.

* TIME Magazine Multimedia Almanac from SoftKey International, Inc.

Contains a selection of fully indexed Time magazine articles from the past 70 years with photos, videos, charts, maps, source materials, and directories that students can place in their projects.

* ZooGuides: The Rainforest from REMedia, Inc.

Provides an in-depth look at the animals, plants, and people of the rain forest regions. Includes detailed information on the wildlife of the rain forests, as well as on conservation issues. Enables students to investigate methods employed to help save the rain forests.

(Monitor is sold separately.)

Elementary Reference Kit

=====

* Eyewitness Encyclopedia of Nature from Dorling Kindersley Multimedia Provides a multimedia reference guide to the natural world. Enables students to watch the behavior of animals in their natural habitat, hear calls of birds of prey, and understand environmental systems of the natural world. Contains stories about more than 250 plants and animals.

* Grolier Multimedia Encyclopedia from Mindscape, Inc.

Combines the resources of a 21-volume encyclopedia with the impact of video and animation. Includes sophisticated hypertext searching tools that allow students to explore ideas by linking words across cultures and time. Contains pictures, video clips, sounds, maps, and speeches.

* HyperStudio from Roger Wagner Publishing, Inc.

Makes it easy for teachers and students to create multimedia presentations that include text, sound, pictures, animations, and movie clips. Includes a self-paced tutorial and samples of presentations.

* Maps 'n' Facts from Broderbund Software, Inc.

Offers a comprehensive world atlas as well as a data-base of information on topics such as agriculture, demographics, education, health, manufacturing, crime, economics, government, people, travel, and the environment. Maps, charts, and text can be printed or exported for reports or presentations.

* Microsoft Dinosaurs from Microsoft Corporation

Enables students to explore the world of prehistoric animals through movies, text, illustrations, and narra-tion. Allows students to access information through an index, atlas, or time line, or by dinosaur family.

* Microsoft Musical Instruments from Microsoft Corporation

Presents the sights and sounds of 200 musical instru-ments from around the world-organized alphabeti-cally, geographically, by family of instruments, and by type of ensemble.

* The Rosetta Stone PowerPac from Fairfield Language

Technologies Provides a unique multimedia tool for language learn-ing. Combines real-life color images, the voices of native speakers, and written text. This special edition, with 22 chapters each of beginning French, Russian, Spanish, German, Dutch, and English, is taken from the award-winning 92-chapter Rosetta Stone Level I programs.

* The San Diego Zoo Presents...The Animals! from Mindscape, Inc.

Lets students see and hear more than 200 exotic animals, birds, and reptiles. Uses movies, sounds, and stories to present comprehensive information. Includes more than 300 animal and habitat exhibits and more than 1,300 color photographs.

* The Way Things Work from Dorling Kindersley Multimedia

Brings David Macaulay's best-selling book to life. Cross-links more than 200 inventions by machine types, inventors, principles of science, and a time line.

* With Open Eyes: Images from the Art Institute of Chicago from Voyager Contains full-screen pictures of over 200 works of art from The Art Institute of Chicago's world-class collection. Provides audio descriptions as well as close-up views of the artwork.

* ZooGuides: Whales and Dolphins from REMedia, Inc.

Provides an in-depth look at whales and dolphins. Includes movies, maps of where species are found, text, sound, and photos, as well as a detailed guide to all the families of whales and dolphins.

* ZooGuides: World of Reptiles from REMedia, Inc.

Provides an in-depth look at reptiles. Includes movies, maps of where species are found, text, sound, and photos, as well as a detailed guide to the various suborders and families of reptiles.

Elementary Curriculum Connections Bundle: Description (10/96)

=====

Article Created: 27 September 1996
Article Reviewed/Updated: 30 October 1996

TOPIC -----

This article contains the description for the Apple Education Series: Elementary Curriculum Connections Bundle.

DISCUSSION -----

Teachers of students in the upper elementary grades know how important it is to create environments that support the development of communication and higher-order thinking skills. Often they use interdisciplinary projects that provide opportunities for active and collaborative learning. Now Apple has made that easier to do.

The Apple Education Series: Elementary Curriculum Connections Bundle provides a Macintosh computer and the Elementary Curriculum Connections Kit--a collection of software tools and resources along with theme-based student projects that make it easy to integrate technology into the upper elementary curriculum. These projects, offering an integrated curriculum approach to the use of computers in the classroom, address the areas of social studies, math, language arts, science, art, music, and more.

Flexibility and adaptability are key here. The variety and scope of the activities make them easy to adapt for different learning styles. And they offer practical ways to introduce different software applications and electronic resources. Students working on a migration project, for example, might interview immigrants about their personal experiences and use the electronic encyclopedia to learn more about their homelands. Planning their own imaginary migration, the students might research possible routes with the electronic atlas, manage their provisions with the spreadsheet, and use the word processor or the multimedia authoring tool to record their journey and prepare it for sharing.

Whether you're just beginning to integrate technology into the curriculum or you're looking for new technology resources for your classroom, the Elementary

Curriculum Connections Kit is the perfect choice.

More Choices, More Flexibility

=====

Now, when you order a Macintosh computer with the Elementary Curriculum Connections Kit, you may also order two other Apple Education Series kits.

It's as easy as 1-2-3.

1. Select a computer. Order the featured solution--which includes a Power Macintosh 5260/120 and the kit--or choose one of the other computers listed below and order the computer and kit separately. Refer to the computer data sheets for more details.

2. Choose two other kits. If you wish to order additional Apple Education Series kits, you can find out what's available on the Education Price List and review the contents on their respective data sheets.

3. Purchase everything at once. The Macintosh computer and up to three kits must all appear on the same purchase order.

(Monitor is sold separately.)

Elementary Curriculum Connections Kit

=====

Software

* At Ease from Apple Computer, Inc.

Offers an easy-to-use alternative--specially designed for children--to the standard Macintosh user interface.

* ClarisWorks from Claris Corporation

Combines word processing, database, spreadsheet, graphics, presentation, and communications software in one familiar, efficient environment. Provides drawing and painting tools, charts, and built-in calculations that students can use to create memos, newsletters, graphs, and reports. Uses PlainTalk for text-to-speech editing.

* The Cruncher from Davidson & Associates, Inc.

Teaches students how to use spreadsheets and graphs in everyday life. Helps students apply mathematical concepts to real-world situations and display the solutions in graphs and charts with sound and animation.

* Earth Explorer from Enteractive, Inc.

Combines an interactive, multimedia encyclopedia with activities that allow students to discover how natural and human forces affect the earth. Encourages students to look at complicated topics from different perspectives.

* Eyewitness Encyclopedia of Science from Dorling Kindersley Multimedia Covers topics in mathematics, physics, chemistry, and life sciences in a multimedia reference guide. Includes quizzes and specialized sections, such as a "who's who."

* Grolier Multimedia Encyclopedia from Mindscape, Inc.

Combines the resources of a 21-volume encyclopedia with the impact of video and animation. Includes sophisticated hypertext searching tools, allowing students to explore ideas by linking words across cultures and time. Contains pictures, video clips, maps, and sounds.

* HyperStudio from Roger Wagner Publishing, Inc.

Makes it easy for teachers and students to create multimedia presentations that include text, sound, pictures, animations, and movie clips. Includes a self-paced tutorial and samples of presentations.

* Maps 'n' Facts from Broderbund Software, Inc.

Offers a comprehensive world atlas as well as a database of information on topics such as agriculture, demographics, education, health, manufacturing, crime, economics, government, people, travel, and the environment. Maps, charts, and text can be printed or exported.

* Math Workshop from Brøderbund Software, Inc.

Enables students to practice and improve computational and problem-solving skills. Tracks progress as students refine their skills in basic arithmetic, estimation, pattern and shape recognition, spatial orientation, scale, symmetry, and problem solving. Includes thousands of math problems at multiple levels of difficulty.

* Scholastic Smart Books: If Your Name Was Changed at Ellis Island from Scholastic Inc.

Engages students in a compelling tale about the immigration experience. Includes video clips, music, and newsreels representing life in earlier times, as well as features that encourage collaboration. Allows teachers to review student notes, record voice messages for students, and create electronic portfolios of student progress. Includes the paperback book.

* SIMtown from Maxis, Inc.

Engages students in an easy-to-use simulation that teaches the basic concepts of economics and resource management. Students create and run their own towns--at the same time developing skills in problem solving, deductive reasoning, and critical thinking.

* Student Writing Center from The Learning Company

Combines full-featured word processing and easy desktop publishing with unique student features that assist in all facets of writing. Designed for writing across the curriculum as well as teacher productivity.

* What's the Secret, Volume 2 from 3M Learning Software

Presents opportunities for students to make discoveries about the world we live in. Starts with questions such as How does my brain think? and Why does glue stick? Encourages students to try out scientific principles. Based on the PBS family science show "Newton's Apple." Includes video clips from the show.

Elementary Curriculum Connections Teachers' Guide

This valuable guide tells how to get started with the Macintosh, describes each of the software programs, and explains how to start using them in the classroom. At the heart of the guide is a collection of interdisciplinary projects and information on assessment, classroom management, and home/school connections. Twenty-seven projects are described in detail. An additional 54 are described more briefly.

QuickTime for Windows 2.1.2: Known Issues (9/96)

Revised: 9/27/96
Security: Everyone

QuickTime for Windows 2.1.2: Known Issues (9/96)

Article Created: 27 September 1996

TOPIC -----

This article contains a list of known issues with QuickTime for Windows 2.1.2.

DISCUSSION -----

The following list details known issues with QuickTime for Windows 2.1.2. Additional information about QuickTime products for Macintosh and Windows can be found on the worldwide web at:

<http://quicktime.apple.com>

1) 32-bit QuickTime for Windows does not have an MCI driver for Win95. This is because Windows 95 does not support 32-bit MCI drivers. 32-bit applications can still make MCI calls, but they will be serviced by 16-bit QTW. Note that you can install both 16- and 32-bit QTW on your system, and 16-bit QTW will automatically be used to support MCI. A similar but opposite situation exists on Windows NT, where 16-bit MCI drivers are not supported, and 32-bit QTW must be installed to get MCI support for both 16-bit and 32-bit applications.

2) 32-bit QuickTime for Windows runs on Windows 95 and Windows NT only. It will not run on Windows 3.1, even if you have Win32s installed.

3) MACE compressed sound is not supported.

4) QuickTime VR (distributed separately) is currently only a 16-bit component, and therefore only works with 16-bit QuickTime for Windows. As a workaround, you can install both 16- and 32-bit QuickTime for Windows on your system, and use the 16-bit Movie Player when you want to view QTVR scenes or objects.

5) QuickTime for Windows may set the audio Requested Rate to the rate of the first movie that you play (which will be 22050 Hz if you play the calibration movie during installation). You may want to change Requested Rate on the QTW control panel Audio page. QTW will not change Requested Rate once you have set

it.

6) Sigma Designs' recently released Real Magic MPEG driver (v2.20) is incompatible with QuickTime for Windows. As a workaround on Win31, you can reinstall the older Real Magic driver (v2.01), but on Win95 there is no other version to install. Sigma Designs and Apple are currently working on a solution.

7) The Cirrus display driver v1.23 (that is, Compaq/CL3X v1.23) can cause QTW control panel crashes. Upgrading to v1.24 fixes the problem.

8) When you are running Windows 95 and you assign a sound to play when a program is launched, you may get a system halt when you launch the 16-bit Movie Player for the very first time. The problem will not recur after the initial system halt and reboot.

9) The game "Critical Path" incorrectly requires MCIQTW.DRV to be in its directory. When you install QuickTime for Windows 2.1.1 and delete the old version, this file is removed. You must copy C:\{windows\system}\MCIQTW.DRV to x:\CRITPATH\QTW for the game to work.

10) The game "RedShift" incorrectly requires QTIM.DLL to be in its directory. When you install QuickTime for Windows 2.1.1 and delete the old version, this file is removed. You must copy C:\{windows\system}\QTIM.DLL to x:\REDSHIFT\QTW for the game to work.

QuickTime for Windows 2.1.2: Read Me File (2/97)

Article Created: 27 September 1996
Article Reviewed/Updated: 27 February 1997

TOPIC -----

This article contains the ReadMe file for QuickTime for Windows
Version 2.1.2.

DISCUSSION -----

For More Info

For more up-to-date information on QuickTime for Windows, check out our Web site
at <http://quicktime.apple.com/>

What's In This Document

Key features
Minimum PC configuration
Quick fix for display problems
Things you need to know
Modifying QTW.INI
Making movies playable on both Macintosh and Windows

Key Features

- Improved performance and reliability
- 32-Bit QuickTime for Windows 95 and Windows NT 3.51 or later
- Multifunctional 16/32-bit control panels
- Improved installation and uninstallation process
- Audio support:
 - MIDI Music tracks
 - IMA 4:1 compressed audio
- Accelerated video support:

Direct hardware support for graphics accelerators:

ATI Mach64, Tseng W32P, P9000, Cirrus Logic CL-GD54xx, WD 90C33

Direct hardware support for video drivers that support 16- or 32-bit

Display Control Interface (DCI)

- Support for burnt and searchable text tracks.
- Support for QuickTime VR for Windows (distributed separately).
- Support for MPEG file playback via Sigma Designs RealMagic Board.
- Support for all standard QuickTime decompressors:
 - Apple Graphics, Apple Animation, Apple Uncompressed, Apple Video,
 - Apple Cinepak, Apple Photo JPEG, Indeo 3.2
- Movie Player application can copy selected portions of text track and current visual to clipboard.
- 16- and 32-bit QuickTime for Windows can coexist on Win95 and WinNT.
- The Movie Player is an OLE server, enabling QuickTime movies to be placed and played in 16- or 32-bit applications.
- QuickTime has MCI (Media Control Interface) that provides media integration in applications like Windows' Media Player and various multimedia authoring applications.
- Visual Basic 2.0, 3.0 and 4.0 is supported with a 16-bit VBX file for QuickTime Movie control.

Minimum Pc Configuration*

386SX at 20 MHz

4 MB RAM

6 MB hard disk space available

VGA or better display card

Windows compatible sound card

CD-ROM recommended

Windows 3.1, Windows for Workgroups 3.11,

Windows 95 or Windows NT 3.51 or later

* MPC 1 and above rated machine.

Quick Fix For Display Problems

QuickTime for Windows is very reliable. However in rare cases you can experience display problems or crashes when attempting to run QuickTime movies or pictures. This is usually caused by older or poorly written system video drivers reporting incorrect video hardware configuration information. If this occurs you can almost always use the QuickTime control panel to work around the problem:

1) Open the Windows Control Panel:

- In Windows 95, select Start/Settings/Control Panel. If you see two QuickTime control panels, perform steps 2-4 on both of them.
- In Windows 3.1 and Windows NT, double-click the Control Panel icon in the Main program group.

2) Double-click the QuickTime control panel icon.

3) Click the More button, then click the Video tab at the top of the window. The video page will appear.

4) Click Video Driver in the Draw Method box, then click Apply. Click Close to shut down the QuickTime control panel.

- 5) Restart Movie Player or the appropriate application to try again.
- 6) If the application still does not work, repeat steps 1-4, and choose a slower draw method (listed in the Draw Method box from fastest to slowest).

In the rare event you cannot gain access to the control panel (due to very serious video driver bugs), you will need to edit the QTW.INI file by hand. Most video playback problems can be corrected by adding:

```
[Video]
Optimize=Driver
```

```
[Video 32]
Optimize=Driver
```

If you still have display problems, make sure you have installed the latest video driver from your computer manufacturer.

Things You Need To Know

-
- 1) 32-bit QuickTime for Windows will not run on Windows 3.1 (even if Win32s is installed).
 - 2) When running QuickTime VR (distributed separately) you must use the 16-bit Movie Player, until a 32-bit QuickTime VR is released.
 - 3) Sigma Designs' recently released RealMagic MPEG driver (v2.20) is incompatible with QuickTime for Windows. As a workaround on Win3.1, you can install the old RealMagic driver (v2.01), but on Win95 there is no other version to install. Sigma Designs and Apple Computer are currently working on a solution.
 - 4) The QuickTime for Windows control panel may crash if your computer is using Cirrus display driver version 1.23. If this happens, you must upgrade to version 1.24 or later.
 - 5) The game "Critical Path" requires MCIQTW.DRV to be in its directory. When you install QuickTime for Windows 2.1.2 and delete the old version, this file is removed. You must copy MCIQTW.DRV from your "windows system" directory (usually C:\WINDOWS\SYSTEM) to \CRITPATH\QTW for the game to work.
 - 6) The game "Redshift" requires QTIM.DLL to be in its directory. When you install QuickTime for Windows 2.1.2 and delete the old version, this file is removed. You must copy QTIM.DLL from your "windows system" directory (usually C:\WINDOWS\SYSTEM) to \REDSHIFT\QTW for the game to work.

Modifying QTW.INI

Do not modify QTW.INI by hand. Please use QuickTime's Control Panel. See above (Quick Fix For Display Problems) for the one exception to this rule.

Making Movies Playable On Both Macintosh And Windows

To make a movie playable on both the PC and the Mac, follow these steps:

- 1) Open a movie file using Movie Player 2.0 or above on the Macintosh.
- 2) Choose Save As from the File menu.

- 3) In the dialog box that appears, click the radio button labeled "Make movie self-contained." This tells the utility to sever any links to other movies after incorporating the relevant video into this movie.
- 4) Select the checkbox labeled "Playable on non-Apple computers." This causes the movie to be saved as a single fork movie.
- 5) Rename the movie using PC naming conventions. The filename should be 8 characters in length for maximum portability. Use the extension ".mov." For example: MYMOVIE.MOV

The resulting file is a QuickTime cross-platform movie that can be played on either a Macintosh or any x86-based computer with Windows 3.x, Windows NT, and Windows 95.

Remember, when creating movies on the Macintosh that the following features are not yet available on Windows:

- MACE, sprites, time code, and modifier tracks
- Apple Component Video decompressor
- Multiple video tracks
- Display of non-burnt text tracks

Apple Spec Database runtime application Read Me (9/96)

Revised: 9/27/96
Security: Everyone

Apple Spec Database "runtime" application Read Me (9/96)

=====

Article Created: 27 September 1996

TOPIC -----

This article is the Apple Spec Database "runtime" application ReadMe file.

DISCUSSION -----

Name: Apple Spec Database "runtime" application

Version: 9/96

Released: September 16, 1996

Description: This application allows users who do not have FileMaker Pro 3.0 to view and use the Apple Spec Database. To use this application the "Apple Spec 9-96.sea" file should also be downloaded.

From the Read Me

Apple Spec Database files contain detailed technical specifications on a variety of Apple computers, displays, and printers introduced since 1984. These specifications include information about memory configurations, power requirements, video capabilities, built-in ports, software, sound capabilities, and logic board components.

The database was originally designed for those who had a regular need for this kind of information, such as sales and support professionals. It also became an easy way for others to learn more about some of the products Apple has introduced over the years. The information is delivered in a cross-referenced database format for easy search and retrieval. It will look best when viewed on a monitor set to 16 or more colors.

Apple Spec Database was created in FileMaker Pro 3.0. To use the database:

Step 1

Open the self-extracting archive which contains the Apple Spec Database files to decompress them. The self-extracting archive is named "Apple Spec 9-96.sea".

Step 2

Open the file named "Apple Spec" using FileMaker Pro 3.0. If you do not have FileMaker Pro 3.0, you can use the Apple Spec Database "runtime" application. (See step 3.)

Step 3 (only necessary if you do not have FileMaker Pro 3.0)

Open the self-extracting archive which contains the Apple Spec Database "runtime" application to decompress it. The self-extracting archive is named "Apple Spec 9-96 app.sea".

PC Compatibility Crd: AppleShare Client for Windows Set Up(9/96)

Revised: 9/27/96
Security: Everyone

PC Compatibility Crd: AppleShare Client for Windows Set Up(9/96)

=====

Article Created: 27 September 1996

TOPIC -----

I have a Power Macintosh 7200/120 computer with a PC Compatibility Card installed running Windows v3.11. I am having difficulty configuring the AppleShare Client for Windows to work under the PC/DOS card and Windows for WorkGroups. I need the IRQ, DMA and interrupt settings.

Where can I find this information?

DISCUSSION -----

These instructions are in Appendix B of the PC Compatibility Card User's Manual, page 155.

Begin_Table

Installing AppleShare for Windows in Windows for Workgroups
=====

This section describes how to install and set up the AppleShare for Windows protocol for use with an ODI driver in Windows for Workgroups.

Step 1

Install the NetWare client software.
For more information, see "Installing NewWare Client Software" earlier in this appendix.

Step 2

Install AppleShare for windows according to the instructions that came with it.

Step 3

Refer to "Running the Network Protocol Setup (SETNET) Utility" near the end of this appendix and follow the instructions there.

Step 4

After running setnet, make sure your configuration files contain the following sections.

These sections assume no other network software is installed.

NET.CFG (with ODI support installed)

```
LINK SUPPORT
    BUFFERS 10 628
    MEMPOOL 16K
```

```
PROTOCOL APPLETALK
    DEFAULT MACODI #1
    AARP MACODI #1  H(0001) L(6) B(090007FFFFFFF)
```

```
LINK DRIVER MACODI
    INT #1 10
    PORT #1 300 0
    FRAME ETHERNET_SNAP
    FRAME ETHERNET_802.3
    PROTOCOL IPX 0 ETHERNET_802.3
    PROTOCOL APPLETALK 80007809B ETHERNET_SNAP
    PROTOCOL AARP 80F3 ETHERNET_SNAP
```

ATDRIVER.BAT (with ODI support installed)

```
C:\APPLE\A_SHARE\LSL.COM
C:\APPLE\A_SHARE\MACODI.COM
C:\APPLE\A_SHARE\ODI.EXE
```

If you install a NetWare client after the AppleShare client, make sure that IPXODI and VLM are loaded after ATDRIVER.BAT in the NET.CFG file.

NOTE: To run the AppleTalk protocol in both the Apple and DOS environments you must have a Macintosh with the Curio Prime Ethernet interface. For more information see the Tech Info Library article titled, "DOS Compatibility Cards and Supported Protocols."

Apple Color LaserWriter 12/660 PS: Description (10/96)

=====

Article Created: 27 September 1996
Article Reviewed/Updated: 18 October 1996

TOPIC -----

This article contains the Apple Color LaserWriter 12/660 PS description.

DISCUSSION -----

Description
=====

The Apple Color LaserWriter 12/660 PS is a high-performance, multiplatform Adobe PostScript color laser printer that provides outstanding results for both color and grayscale printing. It's ideal for anyone who requires convenient, superior-quality color printing capabilities.

Today, everyone—from senior executives to sales professionals to schoolteachers—is looking to improve the impact of printed documents by incorporating color. Color charts can highlight financial data, color logos can make product presentations more appealing, color graphics can grab—and hold—student interest, and on and on. Unfortunately, until now, high-quality color printing involved expensive specialized equipment that put it out of reach for most of those who could benefit from it.

The Color LaserWriter 12/660 PS provides a breakthrough in color printing performance. With its 600-dot-per-inch resolution, it provides the outstanding print quality you need—fast. Its performance contributes to your efficiency; for example, the Color LaserWriter 12/660 PS can be used to print multiple color copies (up to 180 per hour), making it perfect for producing handouts. And to help you get started using this printer quickly and efficiently, your purchase includes not only everything needed to start printing impressive color documents right away, but also delivery and setup.

That convenience remains true over time, too, because the Color LaserWriter 12/660 PS requires only seven printer supplies and features an easy-access

front-loading design. It also comes with valuable tips and techniques to help you get the best performance and image quality possible when working with many of the most popular graphics and page-layout applications. Add to that this printer's easy and flexible networking capability, which lets you share its cost across an entire workgroup (including systems running Windows 95), and color printing has never been so simple.

So if you want convenient color printing—without a compromise in quality—the Apple Color LaserWriter 12/660 PS is the printer for you.

Features

=====

Breakthrough Print Quality

- Offers true 600-dpi resolution for sharp text and graphics
- Provides superior color print quality, as well as high-quality black-and-white printing
- Uses Color PhotoGrade technology for near-photographic-quality color
- Supports ColorSync 2.1 for outstanding color matching
- Provides valuable tips and techniques that can help you enhance print performance when working with many popular graphics and page-layout applications
- Includes 39 PostScript and 64 TrueType fonts

Compatibility

- Works with Windows 95, Windows NT, Windows 3.1, and UNIX software-based systems, as well as with the full line of Macintosh and Power Macintosh computers
- Offers a range of networking connections: standard LocalTalk, IEEE-1284 bidirectional parallel, and Ethernet (supporting AppleTalk, TCP/IP, and Novell NetWare protocols)

Ease of use

- Includes delivery and setup, so you can get started printing immediately
- Offers easy, single-button installation of printing software and fonts
- Includes everything needed to print impressive color output; requires only seven printer supplies
- Includes a 250-sheet cassette and 100-sheet multipurpose tray; offers optional 250-sheet tray that supports letter, legal, A4, and B5

Superior Productivity

- Prints an impressive 12 pages per minute for black and white, 3 pages per minute for color, and 1 page per minute for transparencies
- Provides impressive performance through its powerful RISC processor—the 30-MHz AMD 29030—and Apple-designed color-matching and compression ASICs
- Includes a SCSI interface for hard disk drive font storage

System Requirements

=====

- An Apple Macintosh or compatible computer with at least 4MB of RAM and Macintosh system software version 7.1 or later
- An IBM or compatible computer with at least 8MB of RAM and Microsoft Windows 3.1 or Windows 95 or later

Ordering Information

Color LaserWriter 12/660 PS: Technical Specifications (4/97)

Article Created: 30 September 1996
Article Reviewed/Updated: 30 April 1997

TOPIC -----

This article contains the Apple Color LaserWriter 12/660 PS technical specifications.

DISCUSSION -----

Technical Specifications
=====

Print Engine and Controller

- 30-MHz AMD 29030 RISC processor
- Engine life of 300,000 pages monochrome, 150,000 pages color
- No monthly maximum duty cycle

Print Quality

- True 600-dpi resolution
- Color PhotoGrade, Apple's standard enhanced 600-dpi imaging, 200 lines per inch, nearly two times standard 600-dpi color laser printers

Memory

- 16MB of RAM standard; supports Color PhotoGrade Apple Contone Compression technology which enables 130MB of data to be printed with only a 16MB printer
- Expandable to 40MB with optional upgrades (1MB, 4MB, or 16MB 72-pin, 60ns SIMMs)

Interfaces

- Ethernet port (supports EtherTalk, TCP/IP, and Novell NetWare)

protocols)

- LocalTalk port
- All ports active simultaneously
- IEEE 1284 bidirectional parallel port (special cable required)
- SCSI port for external or optional internal hard disk drive for font storage

Print Speed

- 12 pages per minute for monochrome
- 3 pages per minute for color
- 1 page per minute for transparencies
- Actual print speed depends on file complexity, network traffic, application, and computer used

Language Supported

- Adobe PostScript Level 2

Fonts

- 39 PostScript (Type 1) fonts in ROM, plus screen fonts for Macintosh and Windows from the following families:

ITC Avant Garde Gothic	ITC Bookman Courier	Helvetica
Helvetica Narrow	Helvetica Condensed	Palatino
New Century Schoolbook	Symbol	Times
ITC Zapf Chancery	ITC Zapf Dingbats	

- 64 TrueType fonts on Macintosh disks from the following families:

Chicago	Delphian	ITC Garamond Narrow
Geneva	Helvetica Black	Helvetica Compressed
Lubalin Graph	Lucida Bright	Machine
Monaco	Nadianne	New York
Old English Text	Onyx	Oxford
Swing	Zeal	

- Prints any PostScript (Type 1) or TrueType fonts

Storage

- Optional internal 240MB hard disk drive

Paper Capacities

- Standard 250-sheet feeder, 100-sheet multipurpose tray
- Optional 250-sheet universal feeder

Print Materials

- 16- to 24-lb. (60 to 90 g/m²) bond from the 250 sheet cassette
- 16- to 28-lb. (60 to 105 g/m²) bond from the multi-purpose tray

- Paper: U.S. letter, legal, A4, and B5
- Most letterhead and colored stock
- Use only Apple Color LaserWriter 12/600 PS transparencies

Printer Supplies

- Cyan, magenta, yellow, and black toner cartridges
 - Print 4,000 pages each at 5% coverage
- Photoconductor replacement kit
 - Prints 40,000 pages in black and white or 10,000 pages in color, continuous printing.
 - Prints 13,000 pages in black and white or 6,500 pages in color, intermittent printing. (Printing single-page documents only)
- Fuser oil
 - Prints 10,000 pages
- Fuser replacement kit
 - Air filter, ozone filter, fuser unit transfer drum cleaning unit; replace at 60,000 pages

Power Requirements

- U.S./Japan: 100 to 120 V, 50 to 60 Hz
- Europe/Australia: 220 to 240 V, 50 Hz

Power Consumption

- Operating mode: 100/120 V, 535 W; 220/240 V, 524 W
- Standby mode: 110/120 V, 215 W; 220/240 V, 238 W
- Energy-saving mode: 42 W (complies with EPA Energy Star)

Environmental Requirements

- Temperature: 50 to 86 deg. F (10 to 30 deg. C)
- Humidity: 20% to 80% noncondensing
- Toner cartridge transit environment: -4 to 104 deg. F (-20 to 40 deg. C)

Size and Weight

- Height: 18.0 in. (45.7 cm)
- Width: 21.0 in. (53.3 cm)
- Depth: 23.0 in. (58.4 cm)
- Weight: 110.0 lb. (49.5 kg)

System Requirements

- An Apple Macintosh or compatible computer with at least 4MB of RAM and Macintosh system software version 7.1 or later
- An IBM or compatible computer with at least 8MB of RAM and Microsoft Windows 3.1 or Windows 95 or later

File Sharing and FoxPro Record Lock Process Issue (9/96)

Revised: 9/30/96
Security: Everyone

File Sharing and FoxPro Record Lock Process Issue (9/96)

=====

Article Created: 30 September 1996

TOPIC -----

My Power Macintosh 9500/150 computer freezes when I try to "Close Locks" in Microsoft's FoxPro with File Sharing turned on. The computer fails during the lock process when trying to lock the 221st record. The same computer can then be restarted with the Shift key held down, which turns extensions off, and more than 220 locks can be closed.

Is something wrong with the File Sharing extension, or is this limit also imposed by the AppleShare File Server?

DISCUSSION -----

This error is a result of a toolbox call to PBLockRange receiving return code -5015, which means a server cannot lock any additional ranges. This toolbox call is primarily used by database application to insure integrity of file updates, by selectively locking a range of bytes, typically a record's worth, while an update write operation takes place.

This toolbox call only has meaning when applied to a file on a server volume or a local volume which is shared. Thus when the computer is booted with extensions off, no AppleShare activity like File Sharing or mounting of servers can happen. The call to PBLockRange is ignored since there is no integrity exposure of multiple shared access. This would explain why the error does not occur with extensions off.

"Inside Mac" does not state a limit for simultaneous ranges to be locked, presumably because it can change with the environment (File Sharing, AppleShare Server, Netware) or future implementations. It would appear that Mac OS File Sharing has a limit of 220 ranges that can be locked. Other implementations of AFP (AppleTalk Filing Protocol) could have other maximums.

In talking with Microsoft, they mentioned that this issue was solved with their Visual FoxPro 3.0 product.

If you want to determine the number of locks, here is a FoxPro program that can be used to determine the maximum number of locks in the File Sharing environment.

Begin_Table

```
===== Begin Code Below =====  
SET STATUS ON  
USE SYS(2004)+"Tutorial:Customer.dbf" SHARED  
SET MULTLOCKS ON  
DO WHILE !EOF() AND RLOCK()  
    SKIP  
ENDDO  
===== End Code Above =====
```

End_Table

This program sequences through every record in the database and locks the record, until range locks are exceeded or all records are locked. The database specified, Tutorial:Customer.dbf, is an installed FoxPro sample database or it could be your database. To determine the maximum for a server, there must be enough records in the database to exhaust all available range locks.

AppleShare 4.2.1 to 4.2.2 Updater (9/96)

Revised: 9/30/96
Security: Everyone

AppleShare 4.2.1 to 4.2.2 Updater (9/96)

Article Created: 30 September 1996

TOPIC -----

This article is the AppleShare 4.2.1 to 4.2.2 Updater read me information.

DISCUSSION -----

This patcher application will update AppleShare from 4.2.1 to 4.2.2. Some third party applications and control panels have been found to change the modification dates of certain files to the current date even though no changes have been made to the file.

AppleShare 4.2.1 to 4.2.2 Note

With AppleShare 4.2.1, the modification date of a file can change, even if a file has read-only access. If this occurs, no modifications are made to the actual data in the file. The change is being made by the server, not the client workstation or the application. AppleShare 4.2.2 resolves this issue with third party software incorrectly changing the modification dates of certain files. This patcher application will update AppleShare 4.2.1 to 4.2.2 and prevent this problem from occurring. Apple recommends that AppleShare 4.2.1 customers install this patch.

At Ease: Add CD-ROM Discs & Other Information Appears (10/96)

Revised: 10/1/96
Security: Everyone

At Ease: Add CD-ROM Discs & Other Information Appears (10/96)

Article Created: 1 October 1996

TOPIC -----

When adding CD-ROM discs in the At Ease 3.0.x Administration application, in some cases clicking the Settings button, will display items for another previously installed CD-ROM disc. The settings may or may not be for a CD-ROM disc that is currently in the list, but will always be for a CD-ROM disc that was added sometime in the past.

DISCUSSION -----

A bug was found in the CD-ROM preferences code which dated back to At Ease 3.0. This bug affects all At Ease 3.x (both basic and workgroups, including 3.0.3) and 4.0 for workgroups. The bug has been noted and will be addressed in the next 4.0 version of At Ease; there is no known time frame for this fix.

NOTE: This bug only affects the CD-ROM preferences file.

Fix for At Ease 3.0.x

The "At Ease 3 CDRom Prefs Patch.sea" file has been released and can be found at Apple's online software update locations. This patch is a system extension that corrects a problem with the CD-ROM Preferences command in At Ease versions 3.0 and later and At Ease for Workgroups versions 3.0 through 3.0.3.

Technical Explanation

The bug found calls _UniqueID to locate an unused resource ID to add the CD-ROM item list information. Unfortunately, the call this looking at the Administration application, and not the CD-ROM preference file, so UniqueID will not check for a unique ID in the proper file. This would not be a problem if UniqueID was random, but it seems to generate IDs that are not totally random and thus results in IDs that conflict with IDs that are already in the CD-ROM preference file.

Workaround

If you have At Ease 3.0.x, you should down load the At Ease 3 CDROM Prefs Patch and apply it. If you are using At Ease 4.0, below is a workaround, follow the steps below:

Step 1

Quit the At Ease Administration application and place the CD-ROM Preferences file, located either on the server, or locally (depending on where their information is stored) in the trash. This will start over with an empty CD-ROM list.

Step 2

Launch the At Ease Administration application and add all of the CD-ROM discs at one time. Do not quit the Administration application until they have all been added. You should be able to change the settings later with no problems; it's adding a new CD-ROM discs that cause the bug.

Apple QuickTake Cameras: External Power Q&A (10/96)

=====

Article Created: 1 October 1996

TOPIC -----

This article about the QuickTake 100 and QuickTake 150 digital cameras contains questions and answers regarding the external power requirements.

DISCUSSION -----

Question: What are the external power requirements of the Quicktake cameras?

Answer: The manuals for the QuickTake 100 and Quicktake 150 state that the external power requirements for the camera are:
4.5 V DC/1.75 A to 8.0 V DC/1.0 A.

Question: What is the voltage output of the Battery booster pack?

Answer: 6 volts (nominal).

Question: What is the polarity of the cable used to connect the battery pack to the camera?

Answer: The center terminal of the connector is positive and the shell is negative.

PowerBook Computers: Which Modems Came With Them? (10/96)

Article Created: 1 October 1996
Article Reviewed/Updated: 4 October 1996

TOPIC -----

This article contains a list of Macintosh PowerBook computers that came with modems.

DISCUSSION -----

U.S. or International?

Please note that the international (INTNT'L) and United States (US) versions of the PowerBook computer models listed in the chart below may vary in the types of modems that shipped with them. You should also be aware that all of the international versions of the modems have mini-DIN 8 ports instead of RJ-11 ports, each of which was designed for the appropriate country-specific DAA type.

Begin_Table

Macintosh PowerBook Computers

100, 140, 145, 145B, 170 (INTNT'L)	- Apple Fax Data Modem (2400 bps data, 9600 bps fax)
100, 140, 145, 145B *, 170 (US)	- Apple Fax Data Modem (2400 bps data, 9600 bps fax)
145B * (US)	- Global Village Powerport Bronze Fax modem (2400 bps data, 9600 bps fax) (service part number

150 ** (US & INTNT'L)	- Did not include an internal modem.
160, 165c, 180, 180c	- Apple Express Modem (14.4 bps)
Duo 200 & 2300 series (US & INTNT'L)	- Apple Express Modem for Duo (14.4 bps)
500 Series (INTNT'L) ***	- Apple Express Modem II (14.4 bps)
500 Series (US)	- Global PowerPort Village Mercury for the PowerBook 500 Series (19.2 bps)
5300 & 190 series (US & INTNT'L)	- Do not support internal modems. However, PC (PCMCIA) Card modems can be used in the built-in PC Card slot.

- * - Some early PowerBook 145B models did not include a modem at all while others shipped with the Apple Fax Data Modem.
- Some later PowerBook 145B Plus Pack models shipped with a third-party modem:

PowerBook 145B Plus Pack

- + One version of the PowerBook 145B Plus Pack shipped with a built-in Global Village Powerport/Bronze Fax modem.
- + Other versions of the version of the PowerBook 145B Plus Pack were sold with several different bundled software applications, but did not include a modem.

** Although the PowerBook 150 did not include an internal modem, it was shipped with modem patch software from Apple installed in the System folder. This modem patch software is necessary in order for a third-party modem to be installed and utilized in this computer.

*** International versions of the Macintosh PowerBook 500 series computers came with the Apple Express Modem II (not available in the U.S) instead of a Global Village Modem.

Revised: 4/21/97
Security: Everyone

Tech Note: System 7.5.5 (10/96)

Article Created: 2 October 1996

TOPIC -----

System 7.5.5 includes changes to the Virtual Memory Manager, some substantial Code Fragment Manager improvements, and a variety of enhancements and improvements. We recommend this update for all Macintosh computers running System 7.5.3. System 7.5.5 will only install on a Macintosh or Mac OS-compatible computer running some version of System 7.5.3. If you are running an earlier version of System Software, you need to upgrade to System 7.5.3 before you can install System 7.5.5.

Contents of this Tech Note

- About System 7.5.5 Features
- Future System Software Support
- What Happened to System 7.5.4?
- Detecting System 7.5.5

DISCUSSION -----

About System 7.5.5 Features

Virtual Memory

We rewrote parts of the Virtual Memory Manager for all machines that can support virtual memory. Performance using virtual memory should be substantially improved. When compared to the currently shipping virtual memory, when VM is turned on, the system boots up faster, Power Macintosh applications launch faster, and QuickTime movies play smoother. The following sections describe some of the features of this new VM.

- VM Performance Issues
 - We improved the page aging algorithm.
Every 8 page faults, we aged the physical RAM pages and refilled the

"victim" list consisting of the pages that are to be replaced in the next 8 page faults. The function which did this could take up to 46 ms to age 48 MB of RAM on a Power Macintosh 7500. We replaced the algorithm used by this function with a much simpler and faster algorithm. Worst case for the new algorithm is about the same as the current algorithm because it only has to look at every physical page about once. The pause every 8 page faults is gone.

- Pages are written to disk multiple times because the act of writing a page to disk marks the virtual memory page dirty. When a dirty logical page is replaced, a virtual memory optimization finds up to 6 additional dirty pages contiguous in the virtual memory backing store file, marks the pages clean, and then writes them out to disk with a single write request. Since it's likely that dirty logical pages close to a dirty logical page will have a similar "age" and thus will likely be replaced in the near future, too, this optimization will likely make future page faults faster.

However, LockMemory marks all of the pages locked as dirty and since LockMemory is called on pages written by DMA I/O devices, the just-cleaned pages are dirtied when they are written. That results in an I/O trace to the virtual memory backing store file that can look something like "write 7 pages, read one page, write 7 pages, read one page " instead of the intended "write 7 pages, read 1 page, read 1 page, read 1 page, read 1 page, read 1 page, read 1 page, read 1 page, read 1 page, write 7 pages, read 1 page..."

- New VM API call

A new API call, LockMemoryForOutput, has been added to the _MemoryDispatch trap. This new routine works exactly like LockMemory except that it does not dirty the locked pages. LockMemoryForOutput is meant to be used for DMA operations that just read memory. DMA operations that write to memory must use LockMemory to ensure that the pages are marked dirty. LockMemoryForOutput is called through the _MemoryDispatch trap using selector 10.

The following glue will be added to Memory.h for the new call:

```
/* Lock memory for output */
#pragma parameter __D0 LockMemoryForOutput(__A0, __S1)
extern pascal OSErr LockMemoryForOutput(void *address, unsigned long
count)
TWOWORDINLINE(0x700A, 0xA05C);
```

Developers can determine if LockMemoryForOutput is available by testing for the gestaltVMHasLockMemoryForOutput bit (bit 1) in the gestaltVMAttr Gestalt selector. If bit 1 is set, LockMemoryForOutput is available.

- VM Bug Fixes

- System stability improvements

We fixed several internal calls which had the potential of hanging or crashing your machine when passed invalid arguments. Because of a bug in VM, CFM could occasionally leave a file open when it should not be

left open. Several crashing conditions in HoldMemory and LockMemory were repaired. Other fixes which had previously been made in PowerPC VM were rolled into 68K VM as well.

- Added two new SysError values

If VM's deferred user function table ran out of entries, VM would trash low memory starting at location 0. We now call SysError with dsVMDeferredFuncTableFull (112) instead of trashing memory off of a NULL pointer. You can get this error in several ways. One way is to defer already-deferred i/o requests. Another way is to install a Time Manager task which has already been installed. VM was ignoring all errors while reading or writing to the "VM Storage" backing store file. If there was an error, the system would likely crash later with a seemingly unrelated problem. There's no way to continue or recover if this happens, so VM now calls SysError with dsVMBadBackingStore (113) instead of continuing on with a bad page or memory. This error can happen whenever your backing store volume returns an error. Examples can be genuine disk i/o errors, losing battery power on a SCSI-disk-mode PowerBook, turning off an external hard disk which contains your backing store, and so forth.

- Calls which may be deferred to VM safe time

The following parts of the system are patched by virtual memory so that they may possibly be deferred to VM safe time:

PostEvent

Time Manager tasks

Read, Write, Control, & Status driver calls

VBL tasks

Slot VBL tasks

ADBOP

SCSIDispatch

Inside Macintosh:Memory page 3-11 has a discussion of page faults and deferring user code while the driver of the paging device is busy. The list on page 3-12 is incomplete; the types of code listed above are a more complete list, based on the current VM sources.

- VM now holds some stack for Control and Status calls

VM now holds 2K of stack for all _Control and _Status calls. This 2K of stack was previously being held for _Read and _Write calls.

These changes apply to all machines which can run virtual memory (that is, all machines except the Macintosh Plus, SE, Classic, LC, Portable, PowerBook 100, or Macintosh II without a PMMU).

Code Fragment Manager

We now load libraries better in low memory situations when virtual memory is off. This should help products which use a fair amount of memory (for example, multimedia games) on small memory configuration entry-level Macintosh computers. In particular, a "private copy" of the code for a shared library is now placed in the application heap if there is sufficient room in the application heap, but

there is no room in temporary memory or the system heap. The Code Fragment Manager will use no more than the difference between the minimum memory partition size and the actual memory partition size for this private copy.

We bypass the file system cache (using the technique documented in Inside Macintosh:Files on page 2-95) when reading fragments in memory. We use BlockMoveData in more places. These changes result in faster application loading.

A possible confusing issue for developers is that the Code Fragment Manager may return different error codes under System 7.5.5 than it did under System 7.5.3 or earlier, especially in the case of a missing weakly imported library (called a soft import in Inside Macintosh:PowerPC System Software.) The error code returned will depend upon the options passed to GetSharedLibrary. In particular the errors cfragNoLibraryErr (-2804) and cfragLibConnErr (-2817) might be returned for very similar reasons. Developers should treat these errors as interchangeable. You should check for the existence of weakly imported symbol by using the code in Inside Macintosh: PowerPC System Software on page 1-25, rather than by calling GetSharedLibrary and depending upon a specific error code being returned.

These changes apply to all PowerPC based Macintosh computers. There are no changes to the 68K version of the Code Fragment Manager in this release.

Modern Memory Manager

If an application tried to allocate a small negative amount of memory it would crash with a type 11 error. Inside the Modern Memory Manager, we changed a local variable from signed long to unsigned long, and added checking for overflow from high positive numbers to low negative ones. This affects all PowerPC Macintosh computers.

Background-Only Applications

If two (or more) background-only applications were running and both called MaxApplZone, the system would hang, because the Process Manager was not correctly saving and restoring the process state for each application. (This is the bug documented in Technote PS 2, "Background Only Applications.") This bug had existed since the introduction of faceless background applications. We now correctly save and restore the process state for each application. This affects all machines.

Floppy disk insertion and asynchronous i/o bug

On a Macintosh 6100, 7100, or 8100 machine, when a floppy disk was inserted and there was asynchronous file system activity going on, the machine could hang. An internal routine was incorrect because the ROM was finalized while some experimentation was going on with how the file system works. Machines with later ROMs are fine. We patch the 6100/7100/8100 ROM to bring this ROM family up to date. This only affects these three classes of machine. It affects them at any clock speed.

Floppy disk formatting

On fast processors (180 Mhz or better, 604e), floppy disk formatting would sometimes fail because the code didn't wait long enough to switch heads to the second side. This left the second side unformatted. We changed the timing in the floppy disk formatting routines for this case, and now format floppies correctly. Some machines may have an extension called "PowerMac Format Patch" which does the same thing. If System 7.5.5 installer detects this extension, it should delete it. (The extension will not install its code under System 7.5.5 or later.)

Emulator cache flush bug

If the emulator was requested to flush a non-existing memory range, the emulator could get stuck in an infinite loop. We now check the range to be flushed and exit if invalid memory is specified. This fix affects the PowerBook 5300, 2300, and PCI-based desktop Macintosh computers.

CalcCMask

When color searchprocs were used with CalcCMask the resulting bit mask was randomly shifted to the left creating a jagged edge. This shifting effect was caused by a logic error in an internal QuickDraw macro. The macro returned incorrect mask values (0 / 0xFF instead of 0 / 1) to CalcCMask when the destination pixel depth was 1 bit.

File Manager flush bug

The File Manager was making a request to flush a non-existing memory range. Because of the Emulator cache flush bug described above, the emulator would get stuck in an infinite loop. We patch _GetFPos, _SetFPos, and _Read to fix this problem. This fix affects the PowerBook 5300, 2300, and PCI-based desktop Macintosh computers.

Infrared Remote

On machines which support Infrared Remote Control, there were two problems which could arise. If the CPU was powered up using the remote control, further remote control commands were ignored. If the CPU was powered up normally via the keyboard, the remote control commands would work correctly. However if the volume up or down button was held down (causing repeated Infrared Remote commands) for a sufficient length of time, infrared commands would stop working. This was caused by a patch which wasn't getting installed under some circumstances. This fix applies to all machines which support Infrared Remote Control.

LocalTalk DMA

Fixes a potential data corruption problem when the Macintosh 5400/120 is configured as follows: as a server with multiple clients connected, and simultaneously as an Apple Remote Access server with at least one Apple Remote Access client connected and that client is logged onto a server via Apple Remote Access. When lots of traffic was being generated, the clients could experience data corruption when copying files to or from the Macintosh 5400/120 server. We

also fixed a problem where LocalTalk DMA 1.0 would load on machines without the proper hardware.

IR Talk

System 7.5.3 Revision 2 forgot to include the control panel and driver for IR Talk, so a machine which shipped with System 7.5.3 installed and upgraded directly to System 7.5.3 Revision 2 did not have the same IR Talk drivers as a machine which had System 7.5 Update 2.0 installed, or a machine which had System 7.5 Version 7.5.3 installed.

Ethernet on 5400/6400

On the Macintosh 5400 and 6400 models, the Ethernet support had a bug which manifested itself on very busy Ethernets. These models could have slow communications because of dropped packets. This was due to an internal setting which gave higher priority to certain kinds of packets. Now all packets have the same priority.

SCSI Manager

Added a call to LockMemoryForOutput() as described in the Virtual Memory paragraph.

We changed the interrupt level at which SCSI completion routines get executed from level 2 to level 1. Because the interrupt level was at level 2 the SCSI completion routines slowed the performance of expansion cards (such as video capture and sound cards) whose interrupt level was also at level 2. This affects only PowerPC machines running a native version of SCSI Manager 4.3.

We corrected several errors with the MESH SCSI Controller (found on the desktop PowerPC Macintosh computers.) ACK could be released before REQ. There was a disconnect/reconnect bug with reads on old tape drives. We could misread interrupts from the MESH chip.

We fixed two bugs related to the internal SCSI bus on PCI Macs with Fast SCSI. First, we could occasionally mishandle a reconnect if it came in at precisely the same instant we were attempting a new command on the bus. Second, there was a bug in the Mesh controller which could cause it to give a command done interrupt before the target had released REQ. On a fast machine it was possible to issue a new command to the chip while REQ was still on the bus. The controller interpreted this as a new byte and we transferred it twice. This only happens on asynchronous in phases such as message in, asynchronous data in or status phase. The usual result of this bug was a hang. We now wait for REQ to be removed by the device before issuing a new command to the chip.

Sharing printers

Under some conditions involving a blank name in Sharing Setup and the use of shared printers, you could fail to print with a "Resource Not Found" error. This was because System 7.5 Update 2.0 deleted the blank Pascal string used by Sharing Setup. We reinstall the blank user name string if it is missing. This would only affect some Performa users and some users who had never set their

user name, but upgraded with System 7.5 Update 2.0.

PCI startup hang

On 180 Mhz and faster PCI Macs, there was a bug initializing the PCI bridge chip. This made the PCI bus inaccessible during system startup, resulting in a hang. We now initialize the PCI bridge chip more reliably.

Interrupt Service Routines

If you exit an interrupt service routine at a lower interrupt level than that set when you entered the routine, the interrupt level isn't cleared properly, and you won't process any interrupts of lower priority until an interrupt of the original priority or higher is encountered. This affects PCI Macs and Macs with PowerPC upgrade cards installed. The work around for developers is to ensure that you exit any interrupt service routine at the same priority as that which was set when you entered the routine. We fixed a Sound Manager interrupt service routine which was doing this on desktop Macs with PowerPC upgrade cards.

Control Panels and Shared Libraries

This was noticed during the testing of System 7.5.5. We discovered a third party control panel which was linked with MathLib (probably because it linked with CLib.) Because MathLib is also in ROM, space was allocated for the MathLib globals twice. Because control panels run in the Finder process space, the MathLib globals space was allocated in the Finder's application heap, not in the system heap.

On most machines, the MathLibs globals allocated by the ROM combined with the 22K of MathLib globals allocated by the linked MathLib library are small enough to fit in the free and purgable space left in the Finder's application heap. But on the PowerMac 7500/8500/9500, the MathLib globals allocated by the ROM are also 22K, and the combined 44K of MathLib globals uses all but a few bytes of the Finder's application heap. This results in repeated "Out Of Memory" warnings whenever you try to do anything in the Finder.

Future System Software Support

=====

With the release of System 7.5.5 Update, Apple is delivering its final system software release for the Macintosh Plus, SE, Classic, Portable, PowerBook 100, SE FDHD, SE/30, LC, II, IIX, and IICX. These computers were not designed to support 32-bit memory addressing. Future Mac OS releases will require 32-bit memory addressing, which is supported by all other Macintosh models.

What Happened to 7.5.4?

=====

System 7.5.4 was declared finished. Distribution to seed sites had already begun. A problem was found which led to us halting distribution and revising the product. Rather than having to struggle with two versions of 7.5.4 and the

resulting confusion this would cause, we decided to revise the product version number to 7.5.5.

The differences between 7.5.4 and 7.5.5 are:

- A revision to the IR Talk for the Macintosh 5400 and 6400 families.
- We save the VM preferences and chosen desktop pattern when installing on the Macintosh 5400 and 6400 families.
- A minor revision of the Energy Saver control panel.

Detecting System 7.5.5
=====

To distinguish between the multiple versions of system software, the 'sysu' Gestalt selector has been provided. It returns the version number of the currently installed system update, formatted according to the same conventions as the version numbering used in 'vers' resources, as illustrated in Figure 1.

Begin_Graphic

Figure 1

The format of the Gestalt response for the 'sysu' selector.

```
+---+---+---+---+---+---+---+---+
| 0   2 | 0   6 | 8   0 | 0   0 |
+---+---+---+---+---+---+---+---+

+---+---+
| 0   2 | the Major revision level
+---+---+

+---+---+
| 0   6 | the Minor revision level
+---+---+

+---+---+
| 8   0 | the Development stage
+---+---+

+---+---+
| 0   0 | the Prerelease revision
+---+---+
```

End_Graphic

The presence of the 'sysu' Gestalt selector allows application programs to determine if the current installed system software version was established using the system update. The 'sysu' Gestalt selector will only be defined if a system update package was used to establish the current system version: the 'sysu' selector is not defined on machines shipped with System 7.5.3 preinstalled, nor on system software versions earlier than 7.5.3.

Using the 'sysv' and 'sysu' Gestalt Selectors

Here is how you can use the 'sysv' and the 'sysu' Gestalt selectors to establish information about System 7.5.5:

```
long response, updateversion;
OSErr err;
Boolean seven_five_five;
Boolean is_an_update;

seven_five_five = false;
is_an_update = false;

err = Gestalt(gestaltSystemVersion, &response);
if (err == noErr) {
    seven_five_five = (response == 0x00000755);
    if (seven_five_five) {
        err = Gestalt('sysu', &updateversion);
        is_an_update = (err == noErr);
    }
}

/* at this point, seven_five_five will be true if system 7.5.5 is the current
operating system, and is_an_update will be true if the current system version
was established by update. if is_an_update is true, updateversion will contain
the System update's version number (0x02068000 for 7.5.5). */
```

DOS/PC Compat Card: Error 171 When Installing Windows 95 (10/96)

Revised: 10/4/96
Security: Everyone

DOS/PC Compat Card: Error 171 When Installing Windows 95 (10/96)

=====

Article Created: 3 October 1996
Article Reviewed/Updated: 4 October 1996

TOPIC -----

I keep getting the message, "Error 171 has occurred, please contact technical support," whenever I try to install Windows 95 from the multipart floppy disks onto the PC drive container (used with a DOS or PC compatibility card).

DISCUSSION -----

The most likely reason you are getting this error is that you have mounted the PC drive container onto the desktop in the Macintosh environment. You need to unmount the PC drive container by dragging the icon of PC drive file to the trash (or by selecting it and choosing "put away from the File menu). When the drive file is no longer on the desktop, the Windows 95 installer should be able to access the PC drive container and install per the normal instructions.

ANAT Server: Clean System Install Issue (10/96)

Revised: 10/3/96
Security: Everyone

ANAT Server: Clean System Install Issue (10/96)

=====

Article Created: 3 October 1996

TOPIC -----

This article describes an issue which may arise after performing a clean system software installation on an Apple Network Administration Toolkit (ANAT) server.

DISCUSSION -----

You may encounter errors after a clean installation of system software, re-installation of AppleShare Server software, and then immediately installing ANAT, specifically AppleShare agent and At Ease server, before setting up the server with an Owner and Macintosh name.

The At Ease Server extension will return the error, "Unable to initialize At Ease Server."

The AppleShare Agent will return, "AppleShare Agent Unable to create ADSP listener. Error code -1029". Followed by a cricket like sound.

You can either launch the AppleShare Admin application and setup the server, or open the Sharing Setup control panel and enter the Owner Name and Macintosh name. Restart the server and the ANAT software should load correctly.

Network Administrator Toolkit & Quarterdeck Mail Issue (10/96)

Revised: 10/3/96
Security: Everyone

Network Administrator Toolkit & Quarterdeck Mail Issue (10/96)

=====

Article Created: 3 October 1996

TOPIC -----

I have performed a clean system software installation, then an Apple Network Administrator Toolkit (ANAT) installation, and then a Quarterdeck Mail installation. Quarterdeck Mail will not load because of an unknown error, what is wrong?

DISCUSSION -----

You are experiencing a problem between extensions. If you disable the Network Assistant Startup extension, the Quarterdeck Mail extension loads properly. Ordinarily the Quarterdeck extensions loads after ANAT.

You need to rename either the Quarterdeck, or the Network Assistant Startup extension so the Quarterdeck extension load ahead of Network Assistant Startup alphabetically.

Performa 6400: Farallon Fast Ethernet PCI Card & Driver (10/96)

Revised: 10/3/96
Security: Everyone

Performa 6400: Farallon Fast Ethernet PCI Card & Driver (10/96)

=====

Article Created: 3 October 1996

TOPIC -----

I just installed a Farallon PCI Fast Ethernet Card in my Performa 6400 and it will not working. The card came with no software.

DISCUSSION -----

The Farallon PCI Fast Ethernet Card's drivers are in ROM on the card, so there is no software to install. With these Farallon cards, the drivers are read from ROM, but only through Open Transport. Therefore, you must use Open Transport networking when starting the computer so the drivers will load.

PC Compatibility Card: Configuring GDT PowerPrint (10/96)

Revised: 10/3/96
Security: Everyone

PC Compatibility Card: Configuring GDT PowerPrint (10/96)

=====

Article Created: 3 October 1996

TOPIC -----

I am trying to get the Printer Specific option for PC Compatibility printing to work with GDT PowerPrint. GDT tech support ensured that the proper settings are made for the PC side.

Using the GDT Softworks, the Mac OS prints properly. However when printing from the DOS/Windows environment, the PC Print Spooler launches but remains idle. PC spool files appear in the System Folder:Preferences:Spooler folder, but PC Print Spooler does not appear to do anything with these files.

DISCUSSION -----

Use the following steps to properly configure the GDT PowerPrint software.

Step 1

Connect the printer to your Macintosh using the PowerPrint cable.

Step 2

Install GDT PowerPrint 3.0.1 or later.

Step 3

Choose the Chooser in the Apple Menu, and select the printer.

Step 4

Select the correct port the printer is connected to.

Step 5

Open PC Print Spooler and select Printer Specific in the Preferences window.

Step 6

Switch to the PC environment

Step 7

Launch Windows and go to the printer area (depending on which version of Windows you have this varies).

Step 8

Double-click "Add New Printer" to add the printer.

Step 9

Follow the prompts and install the proper printer driver.

Your printer is now properly configured for printing. The printout may take a little time to print since it has to spool to the Mac OS. PC Print Spooler then tells the GDT driver to print the spool file, then the GDT driver sends the data to the printer.

PC Compatibility Card: CDR101 error reading CD-ROM Discs (10/96)

Revised: 10/3/96
Security: Everyone

PC Compatibility Card: CDR101 error reading CD-ROM Discs (10/96)

Article Created: 3 October 1996

TOPIC -----

I have a PC Compatibility Card in my Power Macintosh computer. I have installed the DOS/Windows drivers for the CD-ROM, but I can only access CD-ROM discs when I am using the Mac OS. When I try to access a CD-ROM disc, I get a message, "CDR101: Not ready reading drive E:, why?"

DISCUSSION -----

CDROM.SYS is the MS-DOS driver allowing the PC Compatibility Cards to access Apple CD-ROM drives. CDROM.SYS requires the proper loading of the Apple CD-ROM extension in the Mac OS, when the Mac OS is starting up. Here are some reason why you may be getting the CDR101: Not ready reading drive E: message.

- 1) You may be using a third-party CD-ROM drive that uses its own CD-ROM extension instead of the Apple CD-ROM extension. Check the CD-ROM drive manufacturer to see if it is compatible with the Apple CD-ROM extension. If it is not compatible, you will not be able to use the CD-ROM drive when you are in the DOS/Windows environment.
- 2) You may be using CD-ROM acceleration software with an Apple CD-ROM drive that replaces the Apple CD-ROM extension. If this is the case, you need to use the Extension manager to switch between the Apple CD-ROM extension and the third-party CD-ROM extension at startup, when you plan on using the PC Compatibility Card.
- 3) You may be using Apple CD-ROM version 5.1.1 or 5.1.2. With these versions of Apple CD-ROM, the PC/Windows environment is unable to read CD-ROM discs if a CD-ROM is not in the drive at startup. The document titled "DOS Compatible: CD-ROM Needs to be in Drive at Startup" explains this issue. To resolve this issue, install Apple CD-ROM 5.1.6 or greater.
- 4) The CD-ROM you are trying to use may not be a format that the PC Compatibility Card can read. The following formats are supported:

ISO 9660

Audio

Hybrid (dual-format Mac/PC) CD-ROM discs*.

* NOTE:

Requires Apple CD-ROM 5.1.5 or later.

PC Compatibility Card: Window for Workgroups TCP/IP Setup 10/96

Revised: 10/3/96
Security: Everyone

PC Compatibility Card: Window for Workgroups TCP/IP Setup 10/96

=====

Article Created: 3 October 1996

TOPIC -----

This article provides instructions for installing Microsoft's TCP/IP protocols and services to your PC Compatibility Card.

DISCUSSION -----

Equipment required:

- DOS Compatibility Card or PC Compatibility Card
- Windows for Workgroups installation media.
- Microsoft TCP/IP (32-bit) for Windows for Workgroups

TCP/IP and Windows for Workgroups

=====

Windows for Workgroups has many TCP/IP product choices that add the TCP/IP protocol and services to your machine. One of these products is Microsoft's 32bit TCP/IP product. This lab will guide you through the installation of this software using the NDIS driver supplied on the Apple PC Card installer disk.

Installation

=====

Step 1

Start "Network Setup"

All network configuration is done with the "Network Setup" application found in the "Network" group on the desktop level. When this program starts you'll find an empty configuration.

Step 2

Press the "Networks..." button to begin the installation.

Step 3

Click the "Install Microsoft Windows Network:" button.

Step 4

Click the "OK" button.

You will return to the "Network Setup" window.

Step 5

Press the "Drivers..." button to add the network interface driver software.

An empty "Network Drivers" dialog appears.

Step 6

Click the "Add Adapter..." button.

After scanning the drive a list of the built-in driver interfaces appears.

Step 7

Select Unlisted or Updated Network Adapter option.

Since you need to use the driver provided on the "PC Software" disk of the DOS Compatibility Card software you must select the Unlisted or Updated Network Adapter" option.

Step 8

Click the "OK" button.

A window will appear, which allows you to navigate to the driver file on the disk. Leave the default of "A:\\" unchanged.

Step 9

Insert the "PC Compatibility Card, PC Image" installer disk.

Step 10

Click the "OK" button.

After the floppy is scanned you are presented with one driver to select, "PC Card Network Driver (NDIS2)".

Step 11

Select PC Card Network Driver (NDIS2)

Step 12

Click the "OK" button.

The original "Network Drivers" window is redisplayed with the new adapter driver and 2 default protocols, NetBEUI and IPX/SPX.

Beginning the TCP/IP protocol installation

Step 13

Click the "Add Protocol..." button.

Step 14

Select the "Unlisted or Updated Protocol" option.

Step 15

Click the "OK" button.

The next dialog box will ask you for the location of the protocol installer. Use the default of "A:\"

Step 16

Insert the "TCP/IP-32 for Windows for Workgroups" installer disk and click the "OK" button.

Step 17

Select the only option available in the next window, "Microsoft TCP/IP-32 3.11b" and click the "OK" button.

After the protocol stack is copied from the disk, you return to the "Network Drivers" window which now shows the new TCP/IP protocol component.

Step 18

Remove the extra protocols by highlighting NetBEUI and IPX, then clicking the remove button.

Step 19

Select the TCP/IP protocol item and press the "Setup..." button.

Fill in all relevant information in the following windows. When all the TCP/IP information is entered, click the "OK" button to return to the "Network Drivers" window.

Note:

You must provide a minimum of the IP Address and Subnet Mask. Many Installations also require the Default Gateway and DNS Information.

Step 20

Click the "OK" button.

A screen asking for some client computer information will appear. After providing the relevant information, click the "OK" button.

Windows for Workgroups now begins to install the new components your selected options require. You might need to supply original Windows for Workgroups software during this process.

When all software has been loaded you'll be asked to restart the computer.

Step 21

Click the "No" button.

You now need to make the final configuration adjustment in the PROTOCOL.INI configuration file. In the PROTOCOL.INI file you need to make an entry for the correct Ethernet Frame Type.

Step 22

Use the "Notepad" application in the "Accessories" group and open the "C:\WINDOWS\PROTOCOL.INI" file.

After it is displayed find the section that begins with the "[MACNDIS]" heading. You'll find a line in that section that begins "ProtocolDot2...".

Step 23

Change the "ProtocolDot2... to ProtocolDIX="800,806,8035".

NOTE:

The "800,806,8035" needs to be enclosed in double quotes). This entry informs the NDIS driver you wish to use the correct Ethernet frame type for TCP/IP applications (ETHERNET_II).

Step 24

Save the file and quit Notepad.

Step 25

Quit Windows.

Step 26

Restart your computer.

Once you restart Windows you can enter a DOS shell and use PING to test your connectivity. You'll notice a new program group, "Microsoft TCP/IP-32" that contains some basic TCP/IP software utilities.

Network Assistant: How to Get Software Versions (10/96)

Revised: 10/3/96
Security: Everyone

Network Assistant: How to Get Software Versions (10/96)

=====

Article Created: 3 October 1996

TOPIC -----

I am using the Network Assistant application which is part of the Apple Network Administrator Toolkit (ANAT), and I'm trying to get software version information about one of the workstations. When I select the Software Version menu item from the Reports menu, a window reports, "This report displays version information for software installed on (name of remote workstation)". However, the window only lists the software installed on my local computer. How do I get information about the workstation that I selected?

DISCUSSION -----

In this window, is a Get Report button. Click on one of the software items in the list then click Get Report, and the version information from the remote workstation will be returned. The main window will only list software located on the local computer.

StyleWriter: Software Installation Troubleshooting (10/96)

Revised: 10/7/96
Security: Everyone

StyleWriter: Software Installation Troubleshooting (10/96)

=====

Article Created: 3 October 1996

TOPIC -----

This article covers some of the more common issues when trying to install the Apple StyleWriter software.

DISCUSSION -----

Error Message During Installation

=====

Prior to ANY software installation, you should start with extensions off when running any installer and check to make sure there is adequate hard drive space for installation.

Remove the Fonts Folder

Sometimes when the Installer finds a font already installed, it generates an error. If you are doing the standard Easy Install and a generic error message appears instructing you that the printer software could not be installed onto the requested disk, remove the Fonts folder. To remove the Fonts folder, do the following:

Step 1

Restart your computer with extensions off.

Step 2

Open the System folder.

Step 3

Drag the fonts folder out of the system folder and place it on the desktop.

Step 4

Restart the computer again with extensions off

Step 5

Launch the StyleWriter software installer (use the Easy Install).

After the installation is successfully completed, drag the individual fonts one at a time from the desktop to the NEW fonts folder created in the System folder. When a duplicate font is found, you do not need to replace the font. Once the old fonts folder has been emptied, throw it away.

IMPORTANT:

DO NOT drag the old Fonts folder from the desktop into the System folder.

Custom Install the StyleWriter Driver

If the easy install did not complete, perform a custom Installation of the StyleWriter printer driver. To install just the StyleWriter printer driver, do the following:

Step 1

Restart your Macintosh with the extensions off (hold down the shift key at startup).

Step 2

Launch the StyleWriter software installer.

Step 3

Select Custom Install from pop-up menu in the main Installer window.

Step 4

Select QuickDraw Printer Software.

Step 5

Click the Install button.

Removing Extensions, Control Panels, and Preferences Folders

If you still cannot install the StyleWriter printer software, you need to remove the Extensions, Control Panels, and Preference Folders. To do this, follow these steps.

Step 1

Remove the Extensions, Control Panels, and Preferences folders from the System folder and place them on the desktop.

Step 2

Restart with Extensions off.

Step 3

Use the Custom Installation procedure again.

If this successfully installs, you can replace the Extensions, Control Panels, and Preferences by opening each folder up on the desktop and dragging the individual files from each folder into the newly created folders in the System folder. Once the old folders are emptied, you can move them to the trash.

IMPORTANT:

Do NOT drag the old folders themselves from the desktop into the System folder.

The reason you may have to remove these folders is that some installers lock the driver if it is already installed. Also, the printing preferences are sometimes locked, or the General Controls control panel is set to Protect System Folder. Virus software may also remain active even with Extensions off, preventing changes to the System folder. Any of these circumstances can result in the generic "installation cannot take place on this disk" message.

Custom Installation of Desktop Printing Software

With most current StyleWriter printer models, Apple has included the Desktop Printing extension as part of the software. Once you have successfully installed the StyleWriter printer driver, you can use the Custom Installation procedure to install the Desktop Printing extension. If the Desktop Printing extension does not install, you will need to remove the Control Panels, Extensions, and Preferences folders, then perform the custom installation procedure again.

This article appeared in the 7 October 1996 issue of the Information Alley.

Open Transport PPP 1.0f1c9: Beta Release (10/96)

Revised: 10/4/96
Security: Everyone

Open Transport PPP 1.0f1c9: Beta Release (10/96)

Article Created: 4 October 1996

TOPIC -----

This article is the enclosed file with the Open Transport PPP 1.0f1c9 beta release.

DISCUSSION -----

Name: Open Transport PPP
Version: 1.0f1c9
Released: September 23, 1996

Description: Unsupported beta release of Open Transport PPP 1.0. For complete information, please see the Read Me included with this software.

OT PPP 1.0f1c9 consists of 1 disk:

Name as Posted	Actual Disk Name
OT PPP 1.0f1c9.sea	OT/PPP Install

This software is available in two formats (disk images and "Net Install"):

1) A self-extracting archive of a Disk Copy 1440K disk image. To use, download, double-click the downloaded file (this decompresses it), and use Disk Copy to create the disk. Disk Copy can be found in the Utilities folder posted here.

2) A complete OT PPP 1.0f1c9 "Net Install". It includes all software from the OT PPP 1.0f1c9 disk image plus the contents of OT PPP 1.0f1c9-Extras.sea. This posting is provided as a convenience for those customers who:

- want to download just one file.
- want a pre-configured "Net Install" to place on their hard drive or on a server.

PLEASE NOTE: You do not need to download the "Net Install" if you have already downloaded the disk image of OT PPP 1.0f1c9 and the OT PPP Extras.

From the Read Me included with this software:

Open Transport/PPP
Internet Beta Seed Number 2
Cover Letter

Dear Beta Tester!

Thank you for your interest in our software and willingness to take the time to perform beta testing. This is one of multiple rounds of beta testing, and as the software matures have increased the number of users testing it. This version is being released to all registered Apple Developers, selected customer seed sites, and publically on the Internet. The public seed will commence after OT 1.1.1 goes GM.

Open Transport/PPP requires Open Transport 1.1.1b8c5 or later and has similar CPU and system requirements: 68030 processors and above, or Power Macintosh machines, and on System 7.1, 7.1.1., 7.1.2, or System 7.5.3 or later. System software 7.5.3 may be required by certain application software. Please refer to the 'Read Me Before Installing' file for more information. Open Transport 1.1.1b8c5 is available as a public beta release in the "unsupported" folder on Apple Software Updates sites. You must install OT 1.1.1b8c5 or later before installing this release of OT/PPP.

This release does not come with Apple Technical Support. Apple staff and 3rd party developers will be monitoring the Internet newsgroup comp.sys.mac.comm and we recommend that be the first place you go for help. We will also be publishing information related to PPP on the Open Transport web site <<http://dev.info.apple.com/opentransport>> as we understand the common questions people ask.

Open Transport/PPP provides IP over PPP functionality for dialup clients. It is the first PPP implementation for Mac OS using STREAMS (the native OT API), the first PPP that is native on Power Macintosh, and is the first PPP for Mac OS capable computers that does not use the MacTCP MDEV API (which will be retired with the Mac OS 8, replaced by STREAMS). Apple has developed this PPP implementation from the ground up and it does not share code with any currently shipping PPP implementations. Open Transport/PPP is compliant with the following RFC's:

- * RFC 1661 - PPP
- * RFC 1662 - PPP in HDLC-like framing
- * RFC 1334 - PPP Authentication protocols
- * RFC 1332 - IPCP Internet Protocol Control Protocol
- * RFC 1144 - Compressing TCP/IP Headers for Low-Speed Links

The release includes the IP/PPP client, manual connect & disconnect, CHAP & PAP, terminal window, connect (chat) script, and auto-connect, and an AppleScript scripting addition. The distribution also includes CCL scripts for many popular

..TIL20505-Open_Transport_PPP_1-0f1c9-Beta_Release_10-96.pdf

analog and ISDN modems. Users interact with the software through the TCP/IP, PPP & Modem control panels.

The OT/PPP API will be provided in a subsequent beta release.

We are particularly interested in your testing OT/PPP interoperability with a wide variety of PPP servers and internet providers, as well as exercising the software in general.

Please use the template included with the distribution when submitting bugs.

If you are a customer who is part of Apple's Customer Quality Feedback (CQF) seeding program for Open Transport, please report bugs to your CQF contact. More information about CQF can be found at <<http://www.cqf.apple.com>>

If you are a developer, please use the enclosed template and send your bug reports to DEVSUPPORT@applelink.apple.com and cc: ppp-beta@seeding.apple.com.

If you are an Internet Service Provider or customer who is not part of one of Apple's developer programs, please send your bug reports to paris-seed@seeding.apple.com. Please send any comments of a more general nature to ppp-beta@seeding.apple.com.

Please read the 'Read Me Before Installing' file contained in this seed package for valuable and late-breaking information.

This release also includes a tool we are developing to make it easier to generate modem scripts for new modems, the Apple Modem Script Generator. The scripts MSG generates may need manual fine-tuning. If you are a modem developer and creating CCL scripts for OT/PPP, please contact Beth Reed <reed1@applelink.apple.com> in Evangelism so that we can make sure you're notified of any late breaking changes or enhancements to the CCL language. Please feel free to send any comments concerning the Modem Script Generator to msg@seeding.apple.com.

The ARA Modem Scripting guide in Acrobat format is also included with this release. Though it has not yet been updated to describe PPP-specific changes to the CCL language it should prove a valuable reference for writing and understanding CCL's you need to manually edit.

Thank you for your interest in Open Transport/PPP.

Richard V. Ford Open Transport Product Manager rvf@apple.com

Revised: 10/4/96
Security: Everyone

Printing Stickies: Change Name at Bottom (10/96)

=====

Article Created: 4 October 1996

TOPIC -----

Whenever I print a Stickies note, a name and date show at the bottom of the page. I want to change the name, how do I do this?

DISCUSSION -----

The name which prints at the bottom of the page is the Owner Name in the Sharing Setup control panel. To change the name, open the Sharing Setup control, highlight the Owner Name field, and type the change.

StyleWriter Printers: Print Quality Depends On Paper (10/96)

Revised: 10/7/96
Security: Everyone

StyleWriter Printers: Print Quality Depends On Paper (10/96)

=====

Article Created: 7 October 1996

TOPIC -----

I have a StyleWriter and everytime I go to print the only quality option
avaialble in the print dialog is Best. The Normal and Draft options are dimmed.

DISCUSSION -----

You need to check the paper type setting. Unless you are printing on special
types of media, the paper type should be set for Plain. Some paper types such as
Transparency, Glossy, and Back Print Film require you to use the Best quality
mode.

StyleWriter Printers: Out of Paper Message Troubleshooting 10/96

Revised: 10/7/96
Security: Everyone

StyleWriter Printers: Out of Paper Message Troubleshooting 10/96

=====

Article Created: 7 October 1996

TOPIC -----

I keep getting an error message when I try to print from my StyleWriter printer stating that I am out of paper, but the printer has paper in the tray. When I click on Continue, I get an error message stating the paper is there, but it is the wrong size. Why?

DISCUSSION -----

These error messages are usually caused by using an incorrect or damaged printer cable.

First check to make sure that you are using a peripheral-8 cable (serial cable), and not a LocalTalk or PhoneNet cable with the StyleWriter printer. LocalTalk cables and PhoneNet cables, use small boxes along with specialized cable to connect devices. PhoneNet cables resemble telephone cable. You can only use LocalTalk and PhoneNet cables with certain StyleWriter models containing the optional LocalTalk Adapters.

The correct cabling for most StyleWriter printers is peripheral-8 (serial) cable. The serial cable is a direction connection between the computer and the printer. You should not have any type of splitting or adapter devices between the computer and the printer. In addition, the serial cable should have eight (8) straight and intact pins on both ends of the cable.

If you are using a peripheral-8 cable and still experience problems, try connecting the printer to another computer, or try another peripheral-8 cable.

Quadra/Centris 610 DOS Compatibility Card: Read Me (10/96)

Revised: 10/8/96
Security: Everyone

Quadra/Centris 610 DOS Compatibility Card: Read Me (10/96)

=====

Article Created: 8 October 1996

TOPIC -----

This is the readme file that shipped with the Centris 610 and Quadra 610 DOS Compatibility computers. These computers shipped with PC Setup version 1.0.

DISCUSSION -----

Using DOS and Window Applications With the DOS Compatibility Card for Macintosh

This document contains important information about using your DOS Compatibility Card that is not included in your user's guide.

Using Memory Management Utilities

If you use a memory management utility such as EMM386 or QEMM, you need to configure it to be compatible with your DOS Compatibility Card.

- If you will be using EMM386 (included as part of DOS) and don't require expanded memory, set CONFIG.SYS to:

```
DEVICE=C:\DOS\EMM386.EXE NOEMS RAM=D000-EFFF
```

If you require expanded memory, set CONFIG.SYS to:

```
DEVICE=C:\DOS\EMM386.EXE RAM=D000-EFFF FRAME=D000
```

- If you use QEMM, it is recommended that you use the frame option (ST:F):

```
DEVICE=C:\QEMM\QEMM386.SYS RAM ST:F ARAM=B080-B7FF ARAM=C900-DFFF R:1
```

- If you choose to use the Stealth mapping option (ST:M), set CONFIG.SYS to:

```
DEVICE=C:\QEMM\QEMM386.SYS RAM ST:M X=C800-CFFF X=FC00-FCFF X=FE00-FFFF
```

ARAM=B080-B7FF ARAM=C900-DFFF R:2

For other memory management utilities, configure them so that the only areas in the BIOS that can be mapped to upper memory are from D000 through EFFF.

Make sure you verify that the HIMEM.SYS line in the CONFIG.SYS file has the switch to turn memory testing off. If the HIMEM.SYS line doesn't turn memory testing off, the ROM BIOS may become corrupted when the DOS Compatibility Card is configured for 2 MB of memory:

DEVICE=C:\DOS\HIMEM.SYS /TESTMEM:OFF

NOTE:

Apple does not recommend using automated memory configuration utilities with the DOS Compatibility Card because they can require more memory than management utilities you configure manually. They can also be incompatible with the DOS Compatibility Card.

Using the Serial Ports on the Macintosh

The maximum baud rate supported by the DOS Compatibility Card when a COM port is mapped to a Macintosh serial port is 19,200. If you're capturing serial output to a Macintosh file, there is no limit.

Due to the RS-232 implementation of the Macintosh, not all RS-232 signals are available. These signals are not available: Carrier Detect (CD), Data Set Ready (DSR), Request to Send (RTS), and Ring Indicator (RI). If your application or serial device requires these signals, it will not work.

NOTE:

See "Serial Port Pinout" later in this document for a list of the Macintosh and PC connectors.

The DOS Compatibility Card does not support Carrier Detect (CD). You must configure your communications applications so they do not use CD. Most communications applications can be set to respond to the CARRIER string sent back by most modems.

Using Video

- Correcting Video Synchronization (Video Synch)

Some application programs that write directly to the hardware (especially games) may cause the Apple 13", 14", and 16" monitors to lose video synch when you start the program. If this happens, call the software company to see if one of the following conditions exists:

1. There is a switch to force the application program to make BIOS calls.
2. There is an upgrade available with this feature.

These applications will run on a standard VGA, SVGA, or MultiSync monitor.

- Getting Color on Your VGA Monitor

Due to the way some programs check for color VGA, they may be installed in VGA monochrome. In these cases check the documentation that came with your software to see if there is a setup option to install standard VGA. If the setup option is available, install the software with the standard VGA option. Once a program is installed with standard VGA, it will always display in color.

If you are installing Windows, even though the SETUP program comes up in color, the express setup may install in VGA monochrome. To avoid this you can use the custom setup and verify the video is set to VGA in the configuration screen.

Another way to avoid installing in VGA monochrome is to use the INSTALL.BAT file located on the DOS Compatibility Card Installer (for the DOS Environment) disk. Follow these steps:

1. Run the INSTALL.BAT command, but choose not to install.

The Installer places WINSETUP.BAT and a hardware information file on your C:/ volume.

2. Use the WINSETUP.BAT file to install Windows.

This will force Windows to install in color. You can also use the Windows SETUP program to change the video at any time.

- Using the Video Drivers

Included with your DOS Compatibility Card are video drivers for Windows and third-party applications. These drivers allow you to run Windows with 256 colors at 640 by 480, or if you are using an Apple 16" or VGA display, 16 colors at 800 by 600. Follow these steps:

1. Insert the Display Driver Disk 1 disk in the floppy disk drive while the PC is in the foreground.

2. From DOS, set the current drive to A by typing:

A:

3. Run the setup program by typing:

SETUP

Follow the instructions on the screen to install the video drivers.

NOTE:

If you are using an Apple 16" monitor, DOS will always be displayed at 640 by 480 centered on your monitor.

Using the Apple Adjustable Keyboard

If you are using an Apple Adjustable Keyboard, you cannot use key combinations that combine keys from the main keyboard with function keys at the same time (such as shift-F1). For this reason, you cannot restart the DOS Compatibility Card using the Control, Alt, and Delete key combination. If you need to restart the DOS Compatibility Card, use the Reset button in the PC Setup control panel.

Using Backup Programs

To back up the drive files on your Macintosh, either make a copy of the files by duplicating them in the Finder, or use a Macintosh backup application program. Do not use PC backup programs. PC backup programs do not work because the floppy disk drive is controlled by the Macintosh.

Using MacShare

MacShare is a PC application program included with your DOS Compatibility Card software that allows the PC to view Macintosh folders and volumes as drive letters on the PC. MacShare allows as many shared drives as there are drive letters. To specify the number of drive letters, modify your CONFIG.SYS to include a LASTDRIVE statement:

```
LASTDRIVE=x
```

x must be a letter between E and Z because the PC reserves drives A through D for its floppy and hard disk drives. For example, if you use M as your LASTDRIVE value, you could have up to nine extra drives (using drives labeled E through M). The CD-ROM driver, if installed, will use one letter.

NOTE:

Each additional drive letter uses 100 additional bytes of PC memory.

Using PC Drives and Partitions

The PC Setup control panel allows you to use PC SCSI drives and partitions with the DOS Compatibility Card. If you use a PC drive or partition and you have a utility that mounts these devices on the Macintosh, be sure to unmount the drive or partition before starting the PC by dragging its icon to the Trash. If you don't unmount the drive or partition, you may lose data since both the Macintosh and the PC may write to the device at the same time.

NOTE:

If you are using Apple's Macintosh PC Exchange 2.0 to mount PC devices, the software alerts you if you try booting the PC while the device is mounted.

If you intend to mount your PC drive file, partition, or disk on the Macintosh using a utility such as Apple's Macintosh PC Exchange, do not use a PC compression program. Drives that are compressed cannot be mounted.

Using Floppy Disks and CD-ROM discs

When the PC is in the foreground, you cannot insert Macintosh floppy disks into the floppy disk drive. The PC ejects a Macintosh floppy disk if one is inserted.

Write-protected PC floppy disks can be accessed by both the PC and the Macintosh. Write-enabled floppy disks can be accessed only by the environment that was in the foreground when the floppy disk was inserted.

To eject a floppy disk while the PC is in the foreground press Command-E.

NOTE:

Using Command-E works only when the PC can access the floppy disk. Otherwise switch to the Macintosh and eject the floppy disk from the Macintosh.

CD-ROM discs can be accessed by both the Macintosh and PC (if the included PC software is installed). To eject a CD-ROM disc from the PC, press Command-Y. If the CD-ROM disc cannot be ejected (because a file is in use or the CD-ROM is being shared), the Macintosh beeps to notify you and will not eject the CD-ROM disc.

Printing

The recommended print driver to use with your DOS or Windows application when printing to a QuickDraw (non-PostScript) printer is the Epson LQ-2500.

If the top and bottom of your document gets clipped when you are printing from your PC, follow these steps:

1. Double-click the System Folder on your Macintosh and open the Extensions folder.
2. Double-click the PC Print Spooler.
3. Choose Preferences from the File Menu.
4. Click the button for "Gaps between pages (60 lines)" (under "When emulating an Epson printer").

You can also set notification and status options in this dialog box.

Caches

Your DOS Compatibility Card works best with the Macintosh computer's caches enabled. Follow these steps to enable the caches:

1. Choose Control Panels from the Apple menu.
2. Open the Cache Switch control panel.
3. Click the button for Faster (caches enabled).

4. Close the Cache Switch control panel.

Serial Port Pinout

To connect existing PC serial devices to your Macintosh, you need cables with the correct pinout. The following chart matches the Macintosh pin (Mac Mini DIN-8) with the corresponding PC pin (DB-25):

Begin_Table

Mac Signal	Mac Mini DIN-8	DB-25	RS-232 Name
-----	-----	-----	-----
HSK _o	1	20	DTR
HSK _i	2	5,8	CTS, DCD
TXD-	3	2	TXD
GND	4	7	GND
RXDA-	5	3	RXD
TXDA+	6	N/C	
GPi	7	N/C	
RXD+	8	7	GND

End_Table

TOPIC -----

The PowerBook 1400 will not start up from a CD-ROM disc by pressing the "C" key on the keyboard as many other Macintosh computers do. How can I force it to start up from a CD?

DISCUSSION -----

PowerBook 1400 series computers can be started up from a bootable CD-ROM disc by simultaneously holding down these four keys as the computer is starting up: "COMMAND (the Apple key)" "OPTION" "SHIFT" and "DELETE". Release the keys when the "Welcome to Macintosh" dialog box appears on the display.*

This start up procedure is used when you want to bypass the internal hard drive and force the computer to start up from the next available SCSI or IDE device, which in this case, is the CD-ROM mechanism.

If you continue to hold down the keys past the "Welcome to Macintosh" dialog box appears on the display, the hard drive may not mount on the desktop. However, you can force the hard drive to mount using the Drive Setup application.

Drive Setup is located on the PowerBook 1400 CD inside a folder called "Utilities". If the internal hard drive did not mount, you can force it to mount by following these steps:

Step 1

Double click on Drive Setup.

Step 2

Highlight the hard drive <not mounted>.

Step 3

Pull down the Functions menu and select Mount Volumes. The hard drive should show up on the desktop. Quit Drive Setup.

* Note: If you find that your PowerBook computer still will not start up from the CD-ROM disc after holding down the Command-Option-Shift-Delete keys, press the Caps Lock key one time and try it again. The Command-Option-Shift-Delete key sequence will not work when the Caps Lock key is activated. However, because there is no LED light on the Caps Lock key of the PowerBook 1400 computers, it is impossible to tell if the key is active until the computer is started up.

This article was published in the Information Alley on 21 October 1996.

PowerBook 1400: What Kind Of RAM Card Do I Need? (11/96)

Revised: 11/12/96
Security: Everyone

PowerBook 1400: What Kind Of RAM Card Do I Need? (11/96)

Article Created: 8 October 1996
Article Reviewed/Updated: 12 November 1996

TOPIC -----

What RAM speed is required by the Macintosh PowerBook 1400 series computers?

Is it possible to know which kind of RAM card to buy to expand the memory in my Macintosh PowerBook 1400 series computer without having to open it up?

On which side do I install the RAM expansion cards?

DISCUSSION -----

Speed?

The PowerBook 1400 series computers require 70 nanosecond (ns) RAM. The RAM on the card must be low-profile memory chips.

Which RAM Slot Is Expandable?

The Apple factory slot is to the left (when looking at the PowerBook computer from the front). This slot should not be modified. RAM cards cannot be stacked on top of one another in the Apple factory slot. This slot already has an Apple RAM card in it when it is shipped from Apple.

The customer slot is to the right (when looking at the PowerBook computer from the front). The customer slot supports and has enough room for two cards to be stacked on top of one another.

Which Type of RAM Card Do I Need?

To determine which type of RAM card you need to purchase, follow these guidelines:

* If your Macintosh PowerBook 1400 series computer has a total of 12 MB or 16 MB

of RAM, that probably** means you have the original factory configuration. Only the original RAM is installed. This kind of configuration means that your customer expansion slot is empty. Two RAM cards can be installed in the customer RAM slot, one on top of the other.

** Note: Apple shipped the PowerBook 1400 series computers in both 12 MB and 16 MB configurations. However, it is possible that if your PowerBook has 16 MB, it originally had 12 MB and 4 MB has been added in the customer slot. The only way to be sure the customer slot is empty is to open the computer as described in the Users Manual.

If you are not sure how much RAM you have, you can tell by pulling down the Apple menu when you are in the Finder and selecting About This Macintosh.

There is an Apple RAM expansion card available from authorized Apple Resellers for installation in the customer RAM slot. It is called the Macintosh PowerBook 8 MB Memory Expansion Card (Order No. M4506). This card has a passthrough connector which allows another card to be stacked on top of it.

If you choose to purchase a third-party RAM card (not from Apple), you need to ask the manufacturer if the RAM card they sell goes specifically on the top or bottom or if it will go in either position. You may also want to ask whether or not any other companies' RAM cards can be plugged into their card, or if only their brand of RAM cards can be stacked on top of each other.

* If your Macintosh PowerBook 1400 series computer has a total of more than 16 MB of RAM, that means you definitely have more than the original factory configuration. There is already a RAM card installed in the customer expansion slot.

If the card in the customer expansion slot is an Apple RAM card, you can plug another Apple RAM card in on top of it. If it is a third-party RAM card, you need to ask the manufacturer whether or not this particular card can have another card (Apple or third-party) stacked on top of it.

Cyrillic Lang Kit: Does It Follow Stnrd Keyboard Layout? (10/96)

Revised: 10/10/96
Security: Everyone

Cyrillic Lang Kit: Does It Follow Stnrd Keyboard Layout? (10/96)

=====

Article Created: 9 October 1996

TOPIC -----

Do the phonetic transliterated keyboard layouts used by the Russian language in the Cyrillic Language kit follow the same standard set by the American Teachers of Slavic and Eastern European Language (ATSEEL) or the American Association for the Advancement of Slavic Studies (AASSS)?

DISCUSSION -----

ATSEEL and AAASS have not yet officially agreed upon a recognized standard set of keyboard layouts. However, ATSEEL's Ad Hoc Committee on Standardization of Computer Keyboards for Cyrillic does have a suggestion for keyboard layout usage.

Apple has included as shareware on the CD, Matvey Palchuk's keyboard layout which is based on the work of ATSEEL's Ad Hoc Committee. Since, there was no agreed upon standard at the time Apple's Cyrillic Language Kit was released, it was decided that this was the most appropriate approach for Apple to take.

More information on Matvey Palchuk's keyboard layout is available from the following web site: <<http://www.pitt.edu/~mapst57/rus/russian.html>>.

Cyrillic Language Kit: Using KeyCaps (10/96)

Revised: 10/10/96
Security: Everyone

Cyrillic Language Kit: Using KeyCaps (10/96)

Article Created: 9 October 1996

TOPIC -----

Why doesn't my keyboard seem to match what I see in the manual when I use KeyCaps?

DISCUSSION -----

The keyboards pictured on the keyboard layout cards, key cap labels and in the manual are representations of the ISO international keyboard. This keyboard is not sold in the US. However, it is widely used outside the US. These keyboard layouts will only have minor differences on US keyboards.

Depending on which keyboard is in use, some characters may vary from the included keyboard layout charts. For instance, when you are using the Russian Normal layout with an Apple Extended Keyboard, the square bracket character appears to the left of the number 1 key (under the Escape key), not as shown on the printed layouts.

One KeyCaps feature is the ability to hold down the Command key (in any of the Cyrillic layouts) and see the QWERTY layout (AZERTY or QWERTZ for the French or German transliterations). This is very helpful for faster keymapping recognition without having to look down at the physical keyboard.

Cyrillic Lang Kit: Are Phonemic Stress Marks Included? (10/96)

Revised: 10/10/96
Security: Everyone

Cyrillic Lang Kit: Are Phonemic Stress Marks Included? (10/96)

=====

Article Created: 9 October 1996

TOPIC -----

Although it is not used in the formal written languages some languages, including Russian (for example) utilize something called phonemic stress. A word, therefore, can change its meaning if a different vowel is stressed. This becomes more important for students and language teachers, or where some ambiguity could be implied.

Does Apple include any kind of support for phonemic stress marks in the Cyrillic Language Kit?

DISCUSSION -----

There is no current plan to include phonemic stress marks in Apple's Cyrillic Language Kit. There is, however, a third-party TrueType font called Nevsky which includes accented characters.

It is available from the following web site:
<<http://www.language.brown.edu/LRC/Software.html>>.

A Russian accented QWERTY keyboard layout is also included with the Nevsky font. The web site includes instructions and examples.

Cyrillic Language Kit: Which Languages Are Supported? (10/96)

Revised: 10/10/96
Security: Everyone

Cyrillic Language Kit: Which Languages Are Supported? (10/96)

=====

Article Created: 9 October 1996

TOPIC -----

Which languages, alphabets, and keyboard layouts are supported by Apple's Cyrillic Language Kit?

DISCUSSION -----

The Cyrillic Language Kit supports several Slavic Languages using different variations of the Cyrillic alphabet.

Apple's Cyrillic Language Kit includes two cards, scored for folding in half, to show the Russian, Cyrillic-QWERTY, Cyrillique-AZERTY, and Kyrillisch-QWERTZ layouts. Additionally, there are keyboard stick-ons for Russian, Ukrainian, and Bulgarian. There is no need for stick-ons if using a transliterated keyboard. The manual also includes all the layouts, as well as a transliteration guide (with the names of the letters and a hex table).

There are two separate installations one for English and one for French systems. The following keyboards layouts are available (if all are installed) from the keyboard menu:

Russian

This is referred to in the manual as Russian Normal. This is the one Russians would use, or learn in school. In other words, it is their version of the QWERTY keyboard used in the U.S. It includes "Option" and "Option-Shift" key layouts for additional letters used in the Ukrainian, Belorussian, Macedonian, or Serbian.

Cyrillic-QWERTY

This is a transliteration of the American English QWERTY keyboard. Transliteration means that if I type Xris (Russian for Chris, the "x" is a guttural "h" sound), the correct Cyrillic characters are produced. This would be

used by English QWERTY keyboard users who do not know the "native" Cyrillic keyboard layouts (Russian, Ukranian or Bulgarian). It also includes the "Option" and "Option-Shift" layouts.

Cyrillique-AZERTY

This is the transliteration for the French keyboard. It also includes "Option" and "Option-Shift" layouts.

Kyrillisch-QWERTZ

This is the transliteration for the German keyboard. It also includes "Option" and "Option-Shift" layouts.

Ukrainian

This keyboard layout includes some "Option" and "Option-Shift" letters.

Bulgarian

This keyboard layout includes some "Option" and "Option-Shift" letters.

Apple Video Player: Video Startup Not Installed (10/96)

Revised: 10/10/96
Security: Everyone

Apple Video Player: Video Startup Not Installed (10/96)

=====

Article Created: 10 October 1996

TOPIC -----

Whenever I try to open the Apple Video Player application, I get the following message, "Apple Video Player requires the Video Startup Extension to be installed. Make sure it has been installed in your Extensions folder and that the computer has been restarted."

I have checked in my Extensions folder and the Video Startup extension is installed. Why do I keep getting the error message?

DISCUSSION -----

You need to make sure the Apple Video Player and Video Startup extension are using the same version. If the Apple Video Player version number does not match the Video Startup extension version number, this error message will be seen regardless of whether the Video Startup extension is installed in the Extensions folder.

The Apple Video Player application is normally in the Apple Extras folder while the Video Startup extension is in the Extensions folder. To find the version number of these files you can choose the Get Info command in the File menu.

If you have installed System 7.5 Update 2.0 on your computer, you should perform a custom install Apple Video Player 1.4, which will install both the Video Startup extension and the Apple Video Player.

Power Macintosh 8500 Freezing With S-Video Cable (10/96)

Revised: 10/11/96
Security: Everyone

Power Macintosh 8500 Freezing With S-Video Cable (10/96)

=====

Article Created: 11 October 1996

TOPIC -----

When I connect an external S-video cable only, in other words there is no monitor, to my Power Macintosh 8500/120, the computer appears to hung if I open the Color Picker. The mouse moves, but only beeps when I click anywhere. I do not have to be using a video application, just changing a color in the Labels control panel or in Eudora.

DISCUSSION -----

We were able to reproduce what you describe on a Power Macintosh 8500, by attaching an S-video cable to the secondary video port. After restarting the computer, it was apparent from the Monitors and Sound control panel that "another monitor" was present. Double-clicking a color in the Labels control panel produced the same situation as the ghost monitor, for more information see Tech Info Library article, "System 7.5: Known Color Picker Problems."

Workaround

When the computer appears to hung, you can dismiss the unseen Color Picker dialog by pressing the return or enter key. The computer should then continue to working as expected, however, you cannot change the color with Color Picker.

Another workaround is to change the relative color bit depth settings of the "ghost" and visible monitors so the greater color depth is on the visible monitor. We set the visible monitor to millions of colors and the Color Picker dialog appeared on the main monitor.

Another workaround would be to attach a second monitor and set its color bit depth lower than the first monitor.

Apple Video Player and Scratch Disk (10/96)

Revised: 10/11/96
Security: Everyone

Apple Video Player and Scratch Disk (10/96)

=====

Article Created: 11 October 1996

TOPIC -----

I want to know if there is a way to select which hard disk the Apple Video Player (AVP) uses when capturing video. When I capture video on my Power Macintosh 8500 using AVP, the video capture always occurs on my external hard drive. The external hard disk is not the startup volume.

Which hard disk will Apple Video Player use as a scratch disk, and is there a way to change the scratch disk in Apple Video Player?

DISCUSSION -----

Apple Video Player uses the disk it was launched from for temporary disk space. However, if there is not enough space on the default disk, AVP will not look for another disk to use. There currently is no way to change this from within the Apple Video Player.

ObjectSupportLib 1.1: Its Significance (9/96)

Article Created: 11 October 1996

TOPIC -----

This article describes the versions of ObjectSupportLib and the significance of version 1.1.

DISCUSSION -----

ObjectSupportLib v1.0.2

Shipped with AppleScript 1.1 and with System 7.5, 7.5.1, 7.5.2 and 7.5.3.

ObjectSupportLib v1.0.4

This is the latest version of the ObjectSupportLib that is shipping to developers on the "Essentials • Tools • Objects" CD #20.

ObjectSupportLib v1.1

The ObjectSupportLib 1.1 is functionally identical to ObjectSupportLib 1.0.2. The ObjectSupportLib 1.1 originally shipped with AppleScript 1.1. This library's version was mistakenly labeled as 1.1 to match AppleScript 1.1's version string.

The latest version of the ObjectSupportLib as of this article's publishing is 1.0.4.

MacTCP Control Panel: How & Where to Obtain It (10/96)

Revised: 10/14/96
Security: Everyone

MacTCP Control Panel: How & Where to Obtain It (10/96)

=====

Article Created: 11 October 1996

TOPIC -----

In order to use the Internet, I have been told by my Internet service provider, that I need to get the MacTCP control panel from Apple Computer, Inc. Where can I get it?

DISCUSSION -----

You have various options depending on what version of the Mac OS you have installed.

System 6.0.8 and System 7.0.x
=====

With either Mac OS 6.0.8 or 7.0.x installed, you must use the MacTCP control panel.

Options

- Purchase the TCP/IP Connection for Macintosh kit (Apple PN: M8113Z/B). This kit is available from Apple Developer Catalog (US: 800-282-2732, Outside US: 716-871-6555).
- Purchase any third-party (non-Apple) software packages, or books which license the MacTCP control panel from Apple Computer, Inc.
- Purchase the Mac OS 7.5.x software.

System 7.1.x
=====

With System 7.1 installed, you can use either classic AppleTalk, or Open Transport. If you use classic AppleTalk, you need the MacTCP control panel. If

you use Open Transport, you need the TCP/IP control panel.

Options for Classic AppleTalk

- Same as Mac OS 6.0.8 and 7.0.x users

Options for Open Transport

- Purchase Open Transport (Apple PN: M4252Z/A). It is available from Apple Developer Catalog, or wherever Apple software is sold.
- Purchase the Mac OS 7.5.x software.

System 7.5

With System 7.5 installed on non PCI-based Power Macintosh computers you can use either classic AppleTalk, or Open Transport. On PCI-based Power Macintosh computers, you can only use Open Transport. If you use classic AppleTalk, you need the MacTCP control panel. If you use Open Transport, you need the TCP/IP control panel. The MacTCP control panel is integrated into System 7.5 and later.

If you are using System 7.5, you should update to the latest version available.

Options for Classic AppleTalk

- Use the Custom Installation of Mac OS 7.5 to install the MacTCP control panel.

Options for Open Transport

- Use the Custom Installation of Mac OS 7.5 to install the MacTCP control panel. Then use the Network Software Selector application to switch to Open Transport.

EtherHelp 3.0: How to Get It (10/96)

Revised: 10/14/96
Security: Everyone

EtherHelp 3.0: How to Get It (10/96)

=====

Article Created: 14 October 1996

TOPIC -----

This article describes where to get EtherHelp 3.0.

DISCUSSION -----

EtherHelp 3.0 is a blind packet capture application specifically designed to help people, who design, build, manage, and support networks, get a better idea of what is happening on a LAN or WAN without having to visit that location.

The application works by capturing all network traffic, or a specified portion of that traffic, in the form of packets. Packets captured are not displayed in EtherHelp, but can be saved in a file, which can then be forwarded to a support organization for analysis by EtherPeek 3.0, which can display the saved packets.

If you would like a copy of EtherHelp 3.0, it is available from the Service folder in the tools folder. The URL is:

[ftp://service:mesmer@ftp.aggroup.com/root/service/tools/EtherHelp_3.0_Inst
aller](ftp://service:mesmer@ftp.aggroup.com/root/service/tools/EtherHelp_3.0_Installer)

An EtherHelp guide is also available in the same folder.

Energy Saver 2.0.2: Error Message on Startup (10/96)

Revised: 10/14/96
Security: Everyone

Energy Saver 2.0.2: Error Message on Startup (10/96)

=====

Article Created: 14 October 1996

TOPIC -----

I performed a clean installation of System 7.5.3 from the Macintosh System 7.5 Version 7.5.3 CD-ROM disc, and then I installed System 7.5.5 Update on my Power Macintosh 8500. When I restarted the computer, a dialog appeared with this message, "...the energy saver extension is incompatible with this system. It's version 2.0.2 but should be version 2.0.2." What is wrong?

DISCUSSION -----

Make sure you are using the same version of the Energy Saver control panel and Energy Saver extension. Then, increase the memory partition of the Energy Saver control panel by 23K to correct this.

LaserWriters: Driver Availability for Windows NT 4.0 (3/97)

Revised: 3/21/97
Security: Everyone

LaserWriters: Driver Availability for Windows NT 4.0 (3/97)

=====

Article Created: 14 October 1996
Article Reviewed/Updated: 21 March 1997

TOPIC -----

Are there any Apple LaserWriter printer drivers available for Windows NT 4.0?

DISCUSSION -----

The drivers in the following list are included in Windows NT 4.0 and are supported by Microsoft.

Color LaserWriter 12/600 PS
LaserWriter 12/640 PS
LaserWriter 16/600 PS
LaserWriter Pro 810
LaserWriter Pro 630
LaserWriter Pro 600
LaserWriter Select 360
LaserWriter II_f
LaserWriter II_g
LaserWriter II_{nt}
LaserWriter II_{ntx}
LaserWriter II_{ntx}-J
Personal LaserWriter NT
Personal LaserWriter NTR
LaserWriter Plus
LaserWriter

Apple provides Windows NT 3.5x and 4.0 printer drivers for the following printers:

Color LaserWriter 12/600 PS
Color LaserWriter 12/660 PS
LaserWriter 12/640 PS
LaserWriter 16/600 PS

This software is available as a part of the LaserWriter software for Windows 3.1 on the Apple Software Updates sections. Installation instructions are available in the readme file.

Microsoft wrote the AppleTalk stack for Windows NT, and they support network printing to these printers (not Apple). Apple does support parallel printing on Windows NT.

For more information about driver availability under Windows NT 3.5 or 3.51, please refer to the Tech Info Library article titled, "LaserWriters: Driver Availability for Windows NT 3.5.1."

Article Change History:

21 Mar 1997 - Added additional NT 4.0 information.

24 Feb 1997 - Added Color LaserWriter 12/660 PS.

Apple Workgroup Servers: Can PC Compat Cards Be Used? (4/97)

=====

Article Created: 14 October 1996
Article Reviewed/Updated: 8 April 1997

TOPIC -----

Are the PC Compatibility Cards supported in the PCI-based Workgroup Servers?

DISCUSSION -----

The PC Compatibility cards were not tested by Apple in the Workgroup Server computers, so Apple cannot suggest or recommend their use. It could be theorized that they should work in the same manner as if they were installed in a PCI-based Power Macintosh computer.

An Apple Workgroup Server (WGS) with a PC Compatibility Card installed would be considered quite an unusual setup because the WGS is designed to be used only as a dedicated server. Additionally, the PC Compatibility cards have no server capabilities and will not run Microsoft Windows NT. The PC Compatibility Card could only be used to emulate a desktop PC-DOS computer.

ANS 500 or 700: Drive & PCI Card Distribution (10/96)

Revised: 10/18/96
Security: Everyone

ANS 500 or 700: Drive & PCI Card Distribution (10/96)

=====

Article Created: 14 October 1996
Article Reviewed/Updated: 18 October 1996

TOPIC -----

What is the recommended way to distribute my drives and PCI cards for increased performance in an Apple Network Server (ANS) 500 or 700?

DISCUSSION -----

The Network Server 500 and Network Server 700 have three SCSI buses and two PCI buses.

For SCSI, there are two SCSI-2 Fast and Wide (20 MB/s) buses available internally and one SCSI-1 (5MB/s) bus available externally. The front panel covers Bus 0 IDs 0 through 3, and Bus 1 IDs 4-6, additionally available on the Network Server 700 are Bus 1 IDs 0 and 1 in the rear of the machine.

The preferable arrangement is to divide the drives among the buses as much as possible, especially in a mirror or stripe configuration. The DAT and/or CD may be moved to accommodate a more even balance. If this is done the bootlist needs to be updated for diagnostic devices. A drive that is not SCSI-2 Fast and Wide should be placed on the external bus whenever possible. When that drive is being accessed on one of the two internal buses, the SCSI-2 fast and wide features of the bus are disabled. If the drive was the only drive on one of the internal buses that would not cause any loss of performance on the other internal bus.

For PCI cards, the built-in I/O devices share one PCI bus. The top two PCI slots are for PCI bus 1 which is shared with the system. The bottom four slots are for PCI bus 2. To balance the load between PCI buses, a high bandwidth PCI device should be installed in bus 2. This should not be important with lower bandwidth devices such as a regular 10 MB/second Ethernet card. A few 100 MB/second Ethernet cards or FDDI cards can introduce a significant bandwidth on the 132 MB/second PCI bus.

Powerbook: Why Won't It Read Macintosh Floppies?

=====

Article Created: 14 October 1996
Article Reviewed/Updated: 18 October 1996

TOPIC -----

When I insert some Macintosh-formatted floppy disks into my Powerbook computer it wants to initialize them. However, the same floppy disks are read by my desktop Macintosh with no difficulties. Why does this happen?

DISCUSSION -----

This type of situation can occur even though your Macintosh Powerbook computer's floppy drive is operating within specification. The head mechanism used in Powerbook computers' floppy drives is not capable of recalibrating to the same degree as the floppy drives in desktop Macintosh computers. Therefore, PowerBook computers are "less tolerant" of poor quality disk formatting.

Commercial floppy disks which are duplicated in large volumes at very high speeds generally have lower quality formats. In order to access the information from such disks it may be necessary to format some disks on the Powerbook computer. Then duplicate the commercial software from the original disks using a desktop Macintosh computer and disk duplicating software, such as Apple Disk Copy.

In order to confirm that the Powerbook floppy drive is operating within specification try formatting a disk on the Powerbook. If it can consistently format disks and consistently read them, it is probably operating normally.

System 7.5.5: Needs System 7.5.3 Error Message (10/96)

=====

Article Created: 15 October 1996

TOPIC -----

When installing System 7.5.5 I received an error message indicating that I need System 7.5.3 installed, however, System 7.5.3 is already installed. Is there a problem with the System 7.5.5 installation disks?

DISCUSSION -----

System 7.5.5 will only install after System 7.5.3 has been installed. If the System 7.5.5 installer produces the error you describe and System 7.5.3 is installed, check to be sure you have not renamed any system files. Two files, when renamed, have been found to cause the install issue you describe, their original final names are:

System 7.5 Update
System 7.5.2 Update

When updated to System 7.5.3, the System 7.5 Update file is for a system updated from System 7.5, while the System 7.5.2 Update file is for a system updated from System 7.5.2.

Security: Everyone

System 7.5.5: System Update 2.0 Custom No Longer Works (10/96)

Article Created: 15 October 1996
Article Reviewed/Updated: 16 October 1996

TOPIC -----

This article describes an issue involving System 7.5.5 where System 7.5 Update 2.0 custom installations no longer function.

DISCUSSION -----

Because of the way the System 7.5 Update 2.0 installer checks for a valid system, you cannot perform a custom install from the System 7.5 Update 2.0 installer after installing System 7.5.5 Update. The System 7.5 Update 2.0 installer is looking for a System file with version 7.5. When it finds 7.5.5, it disables all install options.

If you need to custom install software from System 7.5.3, you can use another source such as the System 7.5 Version 7.5.3 software. You can purchase this software at most Apple dealers. You can also clean install System 7.5, or the system your computer came with, update to System 7.5.3, then reinstall System 7.5.5.

A Fix

The System 7.5 Update 2.0 Custom Install script fixes this issue, and has been placed on all Apple software update locations. Below is informaiton from the Read Me file:

System 7.5 Update 2.0 Custom Install Script For Customers Using System 7.5.5

After installing System 7.5.5 Update, you may find it necessary to reinstall components from System 7.5 Update 2.0. However, System 7.5 Update 2.0 will not allow installation of components on computers running System 7.5.5. The supported solution is to perform a clean install. In response to customer needs, Apple Computer is providing this unsupported installer script to allow the custom installation of System 7.5 Update 2.0 components. For example, if you

have the need to install Open Transport 1.1, and have installed System 7.5.5 Update, you can use this unsupported script to install Open Transport 1.1 without performing a clean install.

Instructions For Use

Before using this installer script, it is extremely important that you perform the following instructions to ensure proper installation:

- 1) Make a backup of your system folder before attempting to use this unsupported installer script.
- 2) Open the Extensions Manager control panel.
- 3) Choose "System 7.5.5" from the Sets pop-up menu.
- 4) If you have third-party peripheral devices that are required for installation and that require an extension, turn those extensions back on. (Examples include video drivers, alternative input devices, network card drivers, and removable media.)
- 5) Restart your computer.
- 6) Locate the "System 7.5 Update 2.0 Install" icon that came with your original System 7.5 Update 2.0.
- 7) Drag the "Sys 7.5 Upd 2.0 Custom Install" icon on top of the "System 7.5 Update 2.0 Install" icon.
- 8) Select the components you wish to custom install.
- 9) Click on the "Install" button.
- 10) When the installation is complete, restart your computer.
- 11) Immediately reinstall System 7.5.5 Update by closely following the instructions in the document "About System 7.5.5 Update".

This custom installer script is not supported by Apple Computer. For customers using System 7.5 Update 2.0 to upgrade their computer to System 7.5.3, the supported solution is to perform a clean install of System 7.5 and then install System 7.5 Update 2.0. If you attempt to use this unsupported installer script and continue to experience problems, Apple Computer recommends that you follow the supported solution.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the

Apple Tech Info Library.

Open Transport 1.1.1 Read Me - Part 1

Introduction
=====

This Read Me document contains late-breaking information about Open Transport compatibility, add-on software, and solutions to known problems with third-party software. For instructions about how to use the Open Transport control panels (AppleTalk and TCP/IP), see the Open Transport User's Guide. For additional technical information about Open Transport, see the "Open Transport Technical Info" file that came with Open Transport.

System 7.5.3 notes

License agreement

=====

This release of Open Transport is subject to the terms and conditions of the license agreement that accompanies the software in the file "LICENSE." By downloading the software you agree to abide by the terms and conditions of the license agreement.

System requirements

=====

Open Transport is designed to work on Mac OS-compatible computers with a Motorola 68030 or 68040 family microprocessor, or a PowerPC 601, 603(e), or 604 microprocessor. You should use system software version 7.5.3, 7.5.5 or later with Open Transport, although the earlier system software versions 7.1, 7.1.1 and 7.1.2 releases are also compatible.

Open Transport 1.1.1 can be used on the Performa and Power Macintosh 52xx, 53xx, 62xx and 63xx product lines. When you install OT1.1.1 on a 52xx, 53xx, 62xx and 63xx model you may get a dialog box indicating a hardware issue was detected. If this alert is displayed, Open Transport cannot be installed or loaded until the Cache/ROM DIMM is replaced. Your computer will continue to run classic networking. The required repairs are covered under the Apple repair extension program. Please contact an Apple-authorized service provider to have your computer repaired.

Open Transport requires a minimum of 5 MB of RAM (68030 or 68040 computers) or 8 MB of RAM (PowerPC-based computers). Open Transport memory requirements are based on total system memory including virtual memory, minus the size of any RAM disk and disk cache you're using.

Network interface options

=====

Open Transport 1.1.1 supports PCI bus, NuBus, communications slot, and PC Card network interface cards, as well as built-in LocalTalk, Ethernet, and Token Ring network adapters. For computers without expansion options, Open Transport 1.1.1 also supports a SCSI-attached network adapter. Third party network interface options available for Open Transport include Fast Ethernet, ATM, and FDDI.

Before you install Open Transport 1.1.1

=====

- Read the section "Known Limitations and Other Issues" below to make sure Open Transport 1.1.1 will work on your computer.

- Make backup copies of the software and documents on your hard disk (especially your System Folder) before installing this software.
- For best results, you should install Open Transport 1.1.1 over Open Transport 1.1 and not over a beta version of 1.1.1. Several beta test sites have experienced problems when updating over a beta release. If you choose to install Open Transport 1.1.1 over a beta version, be sure to copy and save your prefs file.
- Turn on only those extensions installed with your system software. (Open the Extensions Manager control panel and select System 7.5.3 from the Sets pop-up menu, then restart your computer.) Do not turn off all extensions before installing Open Transport.
- Performa and Power Macintosh 52xx, 53xx, 62xx and 63xx models using System 7.5.3 can install Open Transport 1.1.1 directly. Other supported systems must install Open Transport 1.1 and system software version 7.1, 7.1.1, 7.1.2 or 7.5.3 before updating to version 1.1.1.
- If you use SLIP or PPP software to access the Internet, verify that your SLIP or PPP software is compatible with Open Transport. See the section under "Dialup network connectivity - TCP/IP."
- When Open Transport is installed, the Network control panel is replaced by the AppleTalk configuration utility program. The MacTCP control panel is replaced by the TCP/IP configuration utility program. Both AppleTalk and TCP/IP are located in the Control Panels folder. For simplicity and consistency, user documentation generally refers to AppleTalk and TCP/IP as "control panels" even though technically they are utility programs.
- You should download a copy of System 7.5, Update 2.0 to your hard disk or have a copy of the Open Transport 1.1 retail package available. This will give you the software to reinstall Open Transport 1.1 in case you decide to remove Open Transport 1.1.1.

How to turn off or remove Open Transport 1.1.1

=====

Switching to Classic Networking

If your computer does not have a PCI bus, and is using system software version 7.5.3, you can use the Network Software Selector (NSS) utility to turn on classic networking instead of Open Transport. The NSS utility is installed in the Apple Extras folder when you install System Update 2.0. After selecting classic networking, close NSS and restart your computer. When your computer starts up again, open the Network control panel and choose the network connection you want to use.

Removing Open Transport with the Installer

You can remove Open Transport software with the Custom Remove option in the

Installer. However, the Custom Remove option removes a file called the Apple Shared Library Manager (ASLM). If any previous version of ASLM was installed, it was automatically updated to version 2.0.1 when you installed Open Transport 1.1.1. When you remove Open Transport, your previous version of ASLM is not automatically restored.

After removing Open Transport 1.1.1, you must reinstall any applications that rely on ASLM.

To remove Open Transport 1.1.1 using the Installer, follow these steps:

1. Open the Installer included with Open Transport 1.1.1. The Welcome screen appears.
2. Click OK.
3. In the window that appears, choose Custom Remove from the pop-up menu in the upper-left corner.
4. In the list that appears, click the box next to Open Transport so an 'X' appears in it.
5. Click Remove. If a window appears asking you whether to quit any open applications, click Continue. A window will appear telling you to restart your computer.
6. Click Restart.
7. On a Power Macintosh system with PCI bus, you will then need to reinstall Open Transport 1.1 software using either (1) the System 7.5, Update 2.0 installer, (2) the Open Transport 1.1 installer, or (3) a system software CD. If you use the system update installer or the system software that came with your computer, perform a custom install of the network software.
8. On a Macintosh system without PCI bus, classic networking will be restored and made active.

Open Transport Extras Folder

=====

• This release also contains an Open Transport Extras folder which includes the following files for your convenience:

- Claris EMailer 1.1v3 patcher
- MacPPP 2.5 software files
- Remote Only ADEV software
- Network Options for AppleTalk & TCP/IP
- the Open Transport Reference Q & A
- the Open Transport User's Guide

General compatibility

=====

Open Transport is compatible with:

- existing applications that use AppleTalk as specified by Apple Computer, Inc.
- existing applications that use MacTCP as specified by Apple Computer, Inc.
- existing devices (such as printers) that you select in the Chooser

- existing NuBus network interface cards for the Mac OS

Computers running Open Transport can be added to an existing AppleTalk or TCP/IP network without upgrading other computers on the network.

Apple product compatibility update

=====

- At Ease version 2.x or 3.x may encounter problems when starting up with Open Transport. Apple has released an updater utility ("At Ease Basic OT Updater") on Apple Software Update sites on the Internet and selected online services. If you are using At Ease for Workgroups, you should upgrade to version 3.0.2.

- Assistant Toolbox version 1.2 is not compatible with Open Transport, and will result in AppleTalk being turned off each time you restart your system. System 7.5.3 includes an updated version of Assistant Toolbox that is compatible with Open Transport.

- The Apple PCI Token Ring Card (M3904Z/A) requires Open Transport 1.1 or later. The Apple PCI Token Ring card is compatible with Power Macintosh 7500, 8500 and 9500 computers; it is not compatible with 7200/75 and 7200/90 computers.

- Apple LaserWriter Bridge and LocalTalk Bridge versions 2.1f2 or later are compatible with Open Transport.

- Apple Internet Dialer 1.0, part of the Apple Internet Connection Kit 1.0 (stock number M4276LL/A), is not fully compatible with System 7.5.3. This is corrected in AICK 1.1 (stock number 504081U). AICK customers with version 1.0 can update their software by downloading a "patcher" from the Apple Internet Connection Kit home page, available at <<http://www.online.apple.com/kit1/>>.

- Apple Internet Mail Server 1.1 or later software is compatible with Open Transport 1.1 and later. System Update 2.0 (System 7.5.3) is strongly recommended.

- Apple Remote Access (ARA) Multiport Server 2.1, ARA Client 2.0.1, and ARA Personal Server 2.0.1 are compatible with Open Transport 1.1 and later.

- Apple PCI-based Workgroup servers (Application, AppleShare, and Internet) are compatible with Open Transport 1.1.

- Computers running the current versions of Apple IP Gateway and AppleTalk Internet Router must not be updated to Open Transport; these products are based on classic networking. These products do, however, interoperate with computers using either classic or Open Transport networking. Apple has not yet announced plans regarding future versions of these products.

- Apple's MacTCP Ping is not compatible with Open Transport; no update is planned. MacPing from Dartmouth, available at <<ftp://ftp.dartmouth.edu>>, OTTool from Neon Software, available at <<ftp://ftp.neon.com>> and Mac TCP Watcher v2.0 from Peter N. Lewis & Stairways Software available at <<ftp://ftp.share.com>> are Open Transport-compatible alternatives.

NOTE: This note is not part of the original Read Me file. MacTCP Ping 2.0.2 will work for simple pings, but other functions, like record route fail with no explanation.

- ZapTCP is not compatible with Open Transport.

Dialup network connectivity - AppleTalk

=====

For dialup connectivity to AppleTalk networks, Open Transport supports Apple Remote Access version 2.0.1 or later.

Dialup network connectivity - TCP/IP

=====

For dialup connectivity to TCP/IP networks (including the Internet) Open Transport supports third-party extensions known as "MDEVs." Serial Line Interface Protocol (SLIP) and Point to Point Protocol (PPP) connectivity are provided in this manner. Not all versions of all MDEVs are compatible with Open Transport 1.1 and later.

Open Transport 1.1 and later recognizes and is compatible with the following MDEVs. When properly installed they appear in the "Connect via" pop-up menu in the TCP/IP control panel.

- FreePPP - version 1.0.5 or later

FreePPP is shareware and can be found on the Internet, typically at "info-mac" mirror sites in the comm/tcp/conn directory. A list of info-mac mirror sites can currently be found at:
<<http://www.pht.com/info-mac/mirror-list.html>>

Some sites where FreePPP can be found currently include:

<<ftp://mirrors.aol.com/pub/info-mac/comm/tcp/conn/>>
<<ftp://mirror.apple.com/mirrors/Info-Mac.Archive/comm/tcp/conn/>>

FreePPP versions prior to 2.5 may experience problems when running with virtual memory turned on (including RAM Doubler). If you have problems using FreePPP with VM, either update to FreePPP 2.5, or temporarily turn VM off. The current version of FreePPP is 2.5rf.

- MacPPP - version 2.1.4 or later (MacPPP 2.5 is recommended)

MacPPP versions prior to 2.5 may experience problems when running with virtual memory turned on (including RAM Doubler). If you have problems using MacPPP with VM, either update to MacPPP 2.5, or temporarily turn VM off.

An Open Transport-compatible version of MacPPP (MacPPP 2.5) is included in the Open Transport Extras folder. For more information, please refer to the MacPPP Read Me document.

- InterPPP - version 1.2.9 or later; InterPPP II - version 1.1 or later
InterPPP and InterPPP II are commercial software products. For availability and ordering information in the U.S., contact InterCon Systems at 800-468-7266 or 703-709-5500.
- MacSLIP - version 3.0.3 or later
MacSLIP is commercial software developed by Hyde Park Software. For availability and ordering information in the U.S., contact TriSoft at 800-531-5170 or 512-472-0744. For more details see the MacSLIP Web page at <<http://www.zilker.net/~hydepark/>>
- Sonic PPP - version 1.0.2 or later
SonicPPP is commercial software developed by Sonic Systems, Inc. For availability and ordering information in the U.S., contact Sonic Systems at 408-736-1900 (voice) 408-736-7228 (fax). For more details see the Sonic Systems Web page at <<http://www.sonicsys.com/>>
- NTS PPP - 2.0 or later
NTS PPP is commercial software developed by Network Telesystems, Inc. For availability and ordering information in the U.S., contact Network Telesystems at 408-523-8100 (voice) 408-523-8818 (fax). For more details see the Network Telesystems Web page at <<http://www.nts.com/>>
- SAT/SAGEM PPP - 1.02b1 or later
SAT/SAGEM PPP is commercial software developed by SAT/SAGEM. For availability and ordering information in the US, contact SAT/SAGEM at 408-446-8690 (voice) 408-446-9766 (fax). For more details see the SAGEM Web page at <<http://www.satusa.com/>>
- LeoTCP - 2.0.1 or later
LeoTCP is commercial software developed by Hermstedt GmbH. For availability and ordering information in the U.S., contact Hermstedt USA at 1-800-828-5522 (voice). In Europe contact Hermstedt GmbH at +49 621-76500 (voice) +49 621-7650100 (fax).
- T-Online CSLIP - version 1.0.3 or later
T-Online CSLIP is commercial software developed by Computer Consulting GbR. For availability and ordering information in Europe, contact format network & communication at 49 2206 95840. For more details, contact format network & communication at info@format.de.
- University of Michigan ISDN PPP - 2.0.6 or later
- OT/PPP - version 1.0f1c9 or later
Open Transport supports extensions that uses the STREAMS architecture. Apple Computer is developing a version of PPP that takes advantages of this capability. A beta version of OT/PPP 1.0 is available from the "unsupported" folder of Apple Software Updates sites and requires OT 1.1.1.

In addition to these, there are a number of other MDEVs (examples include those from Pacer, FCR, and Tribe) which are indistinguishable from one another to Open Transport. When installed, these appear in the "Connect via" pop-up menu as

"TCP/IP PPP."

Tips for SLIP and PPP configurations

=====

- Some MDEVs are known to be incompatible with other MDEVs. If you experience problems, remove unused MDEVs so that only one MDEV is installed on your computer at a time.
- Users who dial into a TCP/IP network or Internet Service Provider (ISP) may have been assigned a router (gateway) address that is not a part of their local subnet. This was an accepted but technically invalid configuration for MacTCP. Open Transport users should not enter a value for the router address or subnet mask; Open Transport/TCP generates correct values for these fields automatically. In unusual circumstances, these supplied values can be overridden using the Administration mode of the TCP/IP control panel.
- If BootP is used over SLIP or PPP for interface configuration, and if BootP returns additional default router addresses, Open Transport will automatically add those addresses to the list of default routers.
- When Open Transport is installed on a computer that previously had MacTCP configured for a server configuration, the initial configuration method—the selection in the "Configure" pop-up menu in the TCP/IP control panel—is set for the use of a BootP server. This default may not be the appropriate choice for you; please verify.
- If your computer was previously configured for MacTCP "server" addressing and you experience connection difficulties using PPP or SLIP after installing Open Transport, follow these steps:
 1. Open the TCP/IP control panel.
 2. Choose Using PPP Server or Using SLIP from the Configure pop-up menu.
 3. Close the TCP/IP control panel, and save changes when prompted.
 4. Try connecting again.
- If your computer was previously configured for MacTCP "manual" addressing and you experience connection difficulties using PPP or SLIP after installing Open Transport, follow these steps:
 1. Open the TCP/IP control panel.
 2. Choose Manual from the Configure pop-up menu.
 3. Verify that the correct IP address is entered in the Address field.
 4. Close the TCP/IP control panel, and save changes when prompted.
 5. Open the configuration utility supplied with your SLIP or PPP software, and verify that it also reflects the correct IP address in the appropriate location. Refer to the documentation supplied with your SLIP or PPP software for further information on how to enter an IP address, and how to save an updated configuration.
 6. Try connecting again.

NOTE: In MacPPP's ConfigPPP control panel, this setting is entered in the IPCP

..TIL20535-Open_Transport_1-1-1_Read_Me_-Part_1_12-96_(TA36109).pdf

dialog box. Refer to the documentation that came with MacPPP or FreePPP for additional information.

For additional information, see the file OT 1.1.1 Read Me - Part 2.

Open Transport 1.1.1 Read Me - Part 2 (10/96)

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1 ReadMe - Part 2 file.

DISCUSSION -----

Open Transport 1.1.1 Read Me - Part 2

What's new in Open Transport 1.1.1 - general

• Open Transport can now be used on the Performa and Power Macintosh 52xx, 53xx, 62xx and 63xx product lines. When you install OT 1.1.1 on a 52xx, 53xx, 62xx and 63xx computer, you may get a dialog box indicating a hardware issue was detected. If this alert is displayed, Open Transport cannot be installed or loaded until the Cache/ROM DIMM is replaced. The required repairs are covered under the Apple repair extension program. Please contact an Apple-authorized service provider to have your computer repaired. (Your computer will continue to run classic networking until it is repaired.)

• When running System 7.5.3 on a 68020 computer that has been upgraded using a 68040 accelerator card, Open Transport will now run correctly.

• Memory management is improved. On PowerPC-based computers, memory is no longer fragmented. On 68030 or 68040 computers that have turned on the "Load only when needed" option, memory will not unfragment for 2 minutes after a TCP application completes.

• Performance enhancements for opening and closing endpoints have been added. This is particularly visible on Mac OS computers that are busy Web servers.

• Open Transport now registers and unregisters CRM serial drivers.

- The NuBus version of the DOS Compatibility Card is compatible with Open Transport 1.1.1.
- Infrared-compatible versions of LocalTalk drivers are now installed on all models. Previously these drivers were only installed on PowerBooks.

What's new in Open Transport 1.1.1 - AppleTalk

=====

- AppleTalk now properly handles Phase I RTMP packets on LocalTalk. This was causing problems using EtherPrint, TeleBridge, and other third-party forwarding technologies.
- Fixed a problem on a PowerBook Duo where AppleTalk would awaken from sleep on the wrong port when docking with an Ethernet MicroDock.
- Fixed a problem in ARA compatibility where Open Transport would sometimes not get the complete zone list from the server.
- Fixed some problems in ARA compatibility where a packet would not get routed properly, causing computers attached to the local cable of the server not to be visible to the ARA client.
- When using ADEVs, Open Transport requests a specific address from the ADEV. Some ADEVs return no error, but modify low memory locations to indicate a different address than that requested. Open Transport now picks up that different address and uses it (however, if the User Defined option is turned on, AppleTalk will not open).
- Some Ethernet-ISDN bridges used for remote LAN-to-LAN connectivity drop the connection when there is no active data transfer, and dial on demand when there is information to be transferred. If a user's local network does not include an AppleTalk router, a message appears each time the connection is dropped. Use the AppleTalk Options control panel to fix the problem. Open the control panel, turn on the "Suppress router-related alerts" option, then close the control panel.

What's new in Open Transport 1.1.1 - TCP/IP

=====

Server specific fixes and enhancements

- The performance of opening and closing TCP endpoints has been improved. This improvement will be most noticeable on servers with a high volume of short-duration connections (such as Web servers).
- In OT 1.1, sometimes TCP connections could not be reused. Eventually a server application would not be able to accept incoming connections. This has been fixed.
- Fixed a problem where busy TCP servers sometimes accepted no new inbound connections for about 30 seconds every 4 minutes.

- Fixed a memory leak which occurred when Hosts files were used and TCP/IP was set to "load only when needed." Previously, Hosts file entries were not properly deleted from memory when TCP/IP unloaded.
- Introduced a better DNR cache limitation algorithm. Entries that haven't been used for 15 minutes can now be flushed whenever the DNR is heavily used.

Other TCP/IP fixes and enhancements

- Open Transport's MacTCP compatibility now honors the pushFlag parameter to TCPSend call. This is required for some legacy applications to correctly communicate with older, nonconforming hosts. However, no direct control of the TCP pushFlag is or will be provided through the native OT API.
- Entries in the Address and Alias caches now flush when they reach their "time-to-die," and not when they exceed it. TCP/IP also no longer caches resource records with a 0 time to live.
- The DNR now more robustly supports service load-balancing strategies. It no longer maps directly between an alias and the IP address of the host being aliased.
- When dealing with DHCP servers, Open Transport now tries "full-size" packets first, then falls back to "short" packets.
- Fixed a problem with timer overflow on long DHCP leases. Previously, if the lease exceeded 24 days, then TCP/IP connectivity would be lost in a matter of hours.
- Fixed a problem that occurred when one end of a connection closes a "tcp" endpoint, while the other end simultaneously aborts the connection.
- Fixed a problem where a DNR SysInfo request will sporadically fail when a valid reply is mistakenly treated as having been truncated.
- Fixed a hang that occasionally occurred when flushing the DNR address cache.
- Fixed a problem where resolving a bad name sometimes returned no error, when in fact an error occurred.
- Fixed a hang that occurred with applications that use the TCPNoCopyRcv call through the MacTCP compatibility interface. This hang occurred when the MacTCP compatibility interface ran out of memory, either due to being given a small buffer by the application, or by receiving enough inbound data to fill most of the inbound buffer space.
- Fixed a memory leak when opening the resolver in MacTCP emulation mode.
- Open Transport 1.1.1 is compatible with NuBus Token Ring adapters. To ensure compatibility with existing NuBus Token-Ring drivers, Open Transport TCP/IP artificially imposes a MTU of 1500 bytes. This limit should be addressed in a future release.

- Open Transport's MacTCP emulation can now abort a connection where the underlying stream is blocked due to flow control. Applications using the native Open Transport API will have to issue an I_FLUSH ioctl before sending a disconnect when they want to disconnect/abort a flow-controlled connection.

- A new traceroute program for Open Transport/TCP, called "WhatRoute," is now available at <<http://crash.ihug.co.nz/~bryanc/>>. The latest version of Mac TCP Watcher (v2.0) <<ftp://ftp.share.com/peterlewis/>> also now supports traceroute.

Known limitations and other issues

=====

- The AppleTalk control panel displays separate printer and modem ports on the PowerBook 190. LocalTalk will only work correctly when the modem port is selected in the AppleTalk control panel.

- The software that dims the screen of PowerBook Duo computers when the PowerBook is docked and idle is not compatible with Open Transport. Use a third-party screen saver in place of the Apple-provided module.

- In some cases, on a PowerBook 190 configured to use the Infrared Port in the AppleTalk "Connect via" pop-up menu, networking services may become disabled following a sleep/wake or restart. If this happens, try putting the computer to sleep and waking it up again, or use the AppleTalk control panel to temporarily select the modem/printer port before switching back to the infrared port.

- On a IIfx or a Quadra 950, Open Transport can only use the "compatible mode" setting in the Serial Switch control panel. Don't use the "faster mode" setting with LocalTalk.

- On 68030 and 68040 computers, changes in AppleTalk configurations can cause systems running Meeting Maker 3.5 or 3.5.1 to crash. This can occur when changing AppleTalk links, turning AppleTalk off, or bringing ARA connections up or down. This problem will occur on classic networking as well. Apple is working with ON Technology to resolve this problem.

- Open Transport generally requires more memory (RAM) than MacTCP. To conserve memory, you might try some of the following:

- Rename or re-order one or more third-party system extensions (INITs), to change the order in which memory is allocated when your computer starts up. If you use extensions from Global Village, try renaming those extensions so that they load last.
- Especially on PowerPC-based computers, turn on virtual memory.

- When TCP/IP is set to "Load only when needed" (in the control panel's Options window), "pinging" an Open Transport workstation will fail if TCP/IP is not currently being used. To make sure your computer is "pingable" at all times, turn off the "Load only when needed" option (open the TCP/IP control panel and click the Options button, then click the "Load only when needed" checkbox to remove the X) and restart your computer.

- When TCP/IP is set to "Load only when needed" (in the control panel's Options window), the first TCP/IP application opened will cause Open Transport to load into memory. Some older applications don't cause Open Transport to load, and then report errors similar to those encountered when MacTCP is not installed. If this is a problem, turn off the "Load only when needed" option (open the TCP/IP control panel and click the Options button, then click the "Load only when needed" checkbox to remove the X) and restart your computer.

- The TCP/IP control panel is able to obtain and utilize multiple gateway and name server addresses from DHCP and BootP servers. However, it will currently display only the first one. This should be addressed in a future release.

- Generally, you should turn on the "Load only when needed" option in the TCP/IP control panel when using a modem. If TCP/IP is always loaded, your modem may attempt to initiate a dialup connection at startup. Some MDEVs require more system heap memory than is available at startup, which may cause the computer to hang. Also, some Internet service providers charge by connect time, so you may be charged for the connection, even if you weren't using it.

- If you use MacSLIP, you should likewise not configure the MacSLIP control panel to initialize MacSLIP at system startup time. As stated above, this may require more system heap memory than is available at startup, which may cause the computer to hang.

- If you are experiencing problems when using MacSLIP with virtual memory on, increasing your virtual memory size may give you better results. (Use the Memory control panel to increase virtual memory.)

- If you are using Netscape, 16MB or more of built-in memory (RAM) is recommended.

- Some MacTCP-based applications will not function correctly unless the MacTCP DNR file is in its original location at the root level of the System Folder. Do not delete this file when installing or configuring Open Transport.

- You should only specify use of 802.3 framing in the TCP/IP control panel if you have been directed to do so by your network manager, or if you are sure that all other stations on your network segment, including your IP router(s), are also configured to use 802.3 and not Ethernet version 2.0 framing.

- Claris EMailer version 1.1 v3 or later is compatible with Open Transport 1.1.1. Earlier versions of Claris EMailer may not be compatible with Open Transport's "Load only when needed" configuration option. If you experience a system crash 2-3 minutes after quitting EMailer, turn off the "Load only when needed" option. (Open the TCP/IP control panel and click the Options button, then click the "Load only when needed" checkbox to remove the X.) For your convenience, the Claris EMailer version 1.1 v3 patcher and Claris EMailer Lite version 1.1 v3 patcher has been provided in the Open Transport Extras folder.

- The current version of the MacTraceRoute Ethernet LAP does not work on computers running Open Transport.

- NFS/Share versions 1.4.4 or later are compatible with Open Transport.

- When using Netware Client version 5.11 configured for NetwareIP service, the first login may yield a Netware Configuration error message. To avoid this error, open the NetwareIP control panel and change the value under Domain SAP Server (DSS) Retry Attempts from 1 to 2. You can also change Open Transport TCP/IP control panel to always load TCP/IP into memory (open the TCP/IP control panel, click the Options button, and click the "Load only when needed" box to remove the X).
- eXodus 5.2.2 and later are compatible with Open Transport.
- Versions of Anarchie prior to 1.6 have a data corruption problem when used with Open Transport. Make sure you are using Anarchie 1.6 or later.
- If an Apple Remote Access (ARA) user is on a non-routed, extended (Ethernet) network, and there are devices on the local network with the same network number as devices on the remote network, the user won't be able to see the local devices. This problem can be fixed by installing a router. Another workaround is to clear the PRAM on the ARA computer. (Hold down the Control, Option, and P keys simultaneously while starting up the computer). Clearing PRAM causes the computer to start up with a new network number, which should not conflict with the remote network number.
- Daemon 1.0.0 & Daemon Killer 1.0 are not compatible with Open Transport.
- MudDweller 1.2 is not completely compatible with Open Transport. You can open new connections, but the "reconnect" choice does not work correctly.
- The system will crash during launch of NetPresenz if Open Transport TCP/IP is configured to use MacIP and the selected zone has no MacIP server.
- Current versions of VersaTerm SLIP are not compatible with Open Transport.
- Problems can occur with old versions of the KeyServer package from Sassafras Software when TCP/IP is configured to "Load only when needed" (in the control panel's Options window). Contact Sassafras for the latest revisions at <<http://www.sassafras.com>>.
- The combination of Open Transport 1.1.1, LocalTalk Bridge 2.1f2, Global Village Toolbox and GlobalFax extensions causes a crash. This also happens when using classic networking. The workaround is to move the LocalTalk Bridge file to the Extension folder, renaming it to "aLocalTalk Bridge." You can make an alias and rename the alias as desired. Put the alias wherever you want, including the Control Panels folder. This will allow the LocalTalk Bridge to load before Global Village and avoid the cause of the crash.
- To use the CSI Hurdler serial card with Open Transport, contact CSI to get a copy of their preference file patch. This will enable the card to be compatible with Open Transport 1.1.1.
- After installing Open Transport 1.1.1 over a network while using Classic AppleTalk, open the Open Transport 1.1.1 AppleTalk control panel. If you are not using an infrared device, open the "Connect via" pop-up menu and choose Serial

Port.

- The current official release of the MPW shell will hang the system when used with virtual memory and Open Transport. When using the MPW shell and Open Transport, turn off virtual memory. The ETO #21 pre-release MPW shell, version 3.4.2b2, fixes this problem.

System 7.5.3 notes

=====

- System 7.5.3 includes both classic and Open Transport networking.
- The Network Software Selector (NSS) utility, included in the Apple Extras folder with System 7.5.3, provides an easy way to specify either classic or Open Transport networking. The computer must be restarted for a change to take effect.
- During system startup, System 7.5.3 checks for the stored preference for networking software. The load process then causes the appropriate control panels—"Network" and "MacTCP" for classic networking, "AppleTalk" and "TCP/IP" for Open Transport—to become visible. Those control panels associated with the disabled network software are hidden.
- Prior to installing OT 1.1, it was technically possible to install the older MacTCP on a computer running Open Transport. With OT 1.1 and later this is no longer possible.
- If it becomes necessary to reinstall MacTCP or the Network System Installer (NSI) on a 68030, 68040, or NuBus PowerPC-based computers running System 7.5.3 and Open Transport, you must first use NSS to specify classic networking and restart. After restarting, MacTCP and the other components of classic networking are visible.
- If you have a PCI-based computer connected to a Novell Netware network and are using the Netware 5.1 client software, you should also install the Ethernet Compatibility extension version 1.0.3. This extension is available only through a Custom Install from the System Update 2.0 installer, selecting the Ethernet Driver Update. This corrects a problem that could cause your system to crash at shutdown when using MacIPX. However, there will be a two-minute delay in shutting down the computer.
- Network Time v2.0.1 is not compatible with the AutoPower On/Off control panel version 1.0 on a NuBus Power Macintosh with Open Transport. To use Network Time v2.0.1, remove the AutoPower On/Off control panel.

Open Transport 1.1.1 Technical Information

This document contains technical information about Open Transport that may be useful to network managers and administrators. You do not need to read this document in order to use Open Transport.

Contents

=====

Introduction

Files added by the Open Transport installer

Open Transport AppleTalk features

- Static and dynamic AppleTalk address allocation
- Use of parameter RAM

Open Transport TCP/IP features

- DHCP server support
- DHCP address lease support
- Windows NT advanced server support
- BootP support
- Local Hosts file support
- MacTCP "server" addressing support
- MacTCP "dynamic" addressing support
- MacIP support
- PPP connectivity

Memory requirements

Application compatibility guidelines

Performance

Introduction

=====

Open Transport is modern networking and communications system software for the Mac OS. It is based on industry standards and brings a new level of networking connectivity, control, and compatibility to Mac OS computers, while preserving built-in support for easy-to-use networking. Open Transport 1.1.1 is compatible with system software version 7.5.3, 7.5.5 and later, as well as versions 7.1, 7.1.1, and 7.1.2.

For more important information about system requirements, compatibility, and known incompatibilities and limitations, read the Open Transport 1.1.1 Read Me document.

Files added by the Open Transport installer

=====

Open Transport installs the AppleTalk and TCP/IP control panels into the Control Panels folder inside the System Folder of your startup disk. The Open Transport Installer also adds the following files to the Extensions folder inside the System Folder:

Shared Library Manager

Shared Library Manager PPC

These extensions implement a shared library mechanism on 68K and PowerPC Mac OS computers, respectively. Both extensions are required on PowerPC-based computers in order to support both emulated and native shared libraries.

OpenTransportLib

Open Transport Library

These shared libraries implement core Open Transport services on PowerPC-based computers. The first library contains the PowerPC implementation and an interface for native PPC applications. The second library contains the built-in Open Transport modules and an interface for emulated 68K applications.

OpenTptAppleTalkLib

Open Tpt AppleTalk Library

These shared libraries implement Open Transport AppleTalk services on PowerPC-based computers. The first library contains the PowerPC implementation and an interface for native PPC applications. The second library contains the built-in Open Transport modules and an interface for emulated 68K applications.

OpenTptInternetLib

Open Tpt Internet Library

These shared libraries implement Open Transport TCP/IP services on PowerPC-based computers. The first library contains the PowerPC implementation and an interface for native PPC applications. The second library contains the built-in Open Transport modules and an interface for emulated 68K applications.

Open Transport 68K Library

This shared library implements core Open Transport services on 68030- and 68040-based computers.

Open Tpt ATalk 68K Library

This shared library implements Open Transport AppleTalk services on 68030- and 68040-based computers.

Open Tpt Inet 68K Library

This shared library implements Open Transport TCP/IP services on 68030- and 68040-based computers.

Open Transport AppleTalk Features

=====

Static and dynamic AppleTalk address allocation

Open Transport AppleTalk supports static assigned (manually administered) protocol addresses as well as the dynamic addressing provided by AppleTalk Address Resolution Protocol (AARP). Static addressing allows AppleTalk nodes to be managed using the protocol address as a unique and stable identifier.

It is important that all nodes on each individual AppleTalk subnet (a given cable segment assigned a unique network number or network number range) be administered consistently—either all with dynamic addressing or all with pre-assigned static addresses. This avoids a potential conflict when a new dynamic node acquires an address assigned to manually-addressed node that is not connected or is off line. Administrators can enforce the addressing policy for a subnet by locking the addressing mode. As a precaution, Open Transport AppleTalk checks for duplicate protocol addresses on the LAN even when static addressing is configured.

Use of parameter RAM

Under classic AppleTalk, AppleTalk's on/off state, the selected network interface, the previous network (protocol) address, and the previous AppleTalk zone name are saved in persistent memory (parameter RAM) for reuse at startup. To ensure backward compatibility, this information is still stored and retrieved on systems using Open Transport AppleTalk. However, the following differences are found with Open Transport:

- At startup, Open Transport reads the current AppleTalk configuration file to determine if AppleTalk should be turned on or off. This value overrides the value saved in parameter RAM. The user is not explicitly notified when this occurs.
- If the network interface specified in the current AppleTalk configuration file is locked and the specified port is not available or cannot be initialized, Open Transport will not automatically switch the port back to LocalTalk. Instead, AppleTalk will remain off. The user sees a dialog box with this information.

Open Transport TCP/IP features

=====

Open Transport brings a workstation-class implementation of TCP/IP protocols to Mac OS. As with MacTCP, Open Transport TCP/IP is a full 32-bit stack. Open Transport TCP/IP adds support for:

- dynamic path MTU discovery, for more efficient network use in heterogeneous network topologies
- Dynamic Host Configuration Protocol (DHCP), for centralized IP address configuration management. DHCP is an Internet Engineering Task Force (IETF) standards-track protocol.
- IP multicast, for participation as an MBone client for applications written to the native Open Transport API
- simultaneous TCP connections for applications written to the native Open Transport API are limited only by installed memory and processor power, for increased functionality as an Internet or other TCP/IP network server
- a new, more robust and standards-compliant domain name resolver (a caching stub DNR)
- support for developer access to raw IP services, as well as TCP and UDP
- Ethernet Version 2.0 and IEEE 802.3 framing, for better interoperability with a wider range of TCP/IP hosts
- implicit and explicit domain name search paths, for increased control of domain name resolution
- use of multiple IP routers with fail-over, for increased robustness in mission-critical applications
- TCP wildcard source port assignments start at 2048, increasing from that point.

DHCP server support

Apple's implementation conforms to the current versions of the applicable specification documents (RFCs). To date, Open Transport TCP/IP has been tested with the following DHCP server implementations:

- Competitive Automation (URL: <http://www.join.com>)
- FTP Software (URL: <http://www.ftp.com>)
- Hewlett Packard HP-UX (URL: <http://www.hp.com>)
- Microsoft Windows NT Advanced Server (URL: <http://www.microsoft.com>)
- Silicon Graphics (URL: <http://www.sgi.com>)
- Sun Solaris and SunOS (URL: <http://www.sun.com>)
- TGV (URL: <http://www.tgv.com>)

DHCP address lease support

Open Transport TCP/IP supports DHCP address leases. Open Transport TCP/IP automatically attempts to renew any address lease that reaches its renewal interval (by default, the renewal interval is reached when the lease is halfway completed). The renewal interval may be configured to a different value by making changes to the configuring DHCP server. Renewal is attempted regardless of how many times the lease has already been renewed. Lease rebinding is also supported. Should an interface's IP address lease expire, the interface is closed down. Open Transport TCP/IP does not currently support the DHCP Client ID option or the DHCPINFORM message, nor will it currently try to use the remainder of a previous but unexpired lease upon rebooting.

Windows NT advanced server support

With Open Transport 1.1 and later, Mac OS clients are interoperable with the Windows NTAS DHCP server on LAN links. However, Mac OS clients cannot acquire configuration information from an NT DHCP server across a dialup (PPP) link because there is not yet an accepted industry standard for DHCP over dialup. The NT implementation is based on proprietary Microsoft extensions. Mac OS clients cannot acquire configuration information nor register with a Microsoft WINS server. WINS is also dependent on Microsoft extensions to TCP/IP (requiring NetBIOS support).

The Internet Engineering Task Force (IETF) is developing a cross-platform industry standard technology for dynamic registration and look-up of IP names through the Dynamic Service Location working group. Apple has no current plans to implement the WINS extensions. Instead, we are fully committed to implementation of the applicable IETF standards as they emerge

Macintosh clients running versions of Open Transport prior to 1.1 could experience some interoperability problems due to other significant differences between the Microsoft implementation and that of a typical UNIX-based server.

BootP support

Open Transport 1.1 and later fully supports Bootstrap Protocol (BootP). Versions of Open Transport prior to 1.1 failed to accept a BootP Reply sent to the unicast (subnet broadcast) address, (for example, xxx.xxx.xxx.255. Replies sent to the all-nets broadcast address (for example, 255.255.255.255) were handled properly. Also, earlier versions of Open Transport required that the BootP gateway be zero hops away.

Local Hosts file support

Open Transport TCP/IP supports a Hosts file that may be used to supplement and/or customize the Domain Name Resolver's initial cache of information. The Hosts file is normally stored in the Preferences folder in the active System Folder. When Open Transport TCP/IP is initialized, it reads the Hosts file (if any). As in MacTCP, the supported Hosts file features follow a subset of the Domain Name System Master File Format (RFC 1035).

Open Transport TCP/IP is more stringent regarding the content and format of the Hosts file than was MacTCP, which permitted violation of the FQDN requirement

for <domain-name>. For instance, the format:

```
charlie          A          128.1.1.1
```

which was acceptable to the MacTCP DNR, is no longer permitted because of the use of domain search lists in Open Transport/TCP ("charlie" could potentially exist in any or all of the configured domains). To accomplish the same effect, use this format instead:

```
charlie          CNAME      myhost.mydomain.edu
myhost.mydomain.edu  A      128.1.1.1
```

This associates the local alias charlie with the fully qualified domain name myhost.mydomain.edu, and resolves it to the address 128.1.1.1. Use of local aliases is limited to CNAME entries; NS and A entries must use fully qualified domain names.

You can create a Hosts file with any text editor or word processor (the Hosts file must be stored in text format). If you use a Hosts file, keep it as short as possible, and include only entries that will be accessed frequently. This reduces the memory required to cache the DNS information and minimizes the need to maintain and update Hosts files as system information changes.

Open Transport TCP/IP automatically uses a Hosts file stored the Preferences folder of the active System Folder. If no Hosts file is found in the Preferences folder, Open Transport TCP/IP searches the active System Folder for a Hosts file. You can specify a particular Hosts file to use with a specific configuration. For example, one Hosts file might be set up for a user connecting via Ethernet, and another set up for when that user connects via modem.

For additional information about the Hosts file design of the Open Transport Domain Name Resolver, see the document "Apple Open Transport Reference Q&A." The latest version of the Q&A is on the Open Transport 1.1 Installation CD, and is available on the Internet at <ftp://seeding.apple.com/ess/public/opentransport/>.

MacTCP "server" addressing support

Open Transport TCP/IP supports both Bootstrap Protocol (BootP) and Reverse Address Resolution Protocol (RARP) configuration methods. MacTCP Server mode addressing was a combination of BootP and RARP. When Server mode was selected, MacTCP used BootP to attempt to acquire an IP address. If that failed, MacTCP tried RARP. Whichever protocol was successful was stored as a preference, and was used first the next time the computer started up. In Open Transport, you must choose BootP or RARP explicitly.

MacTCP "dynamic" addressing

Open Transport does not support MacTCP "dynamic" addressing. MacTCP dynamic mode addressing was based on an Apple-proprietary extension to TCP/IP protocols. It applied the address negotiation and assignment rules used by the AppleTalk protocols to TCP/IP networks, making it very easy to set up a Macintosh-only standalone TCP/IP network. Use of this dynamic addressing method in other scenarios, however, could create additional work for a network administrator.

The Internet community (IETF) has since developed a multivendor standard for the dynamic assignment of IP addresses, known as Dynamic Host Configuration Protocol (DHCP). Open Transport TCP/IP supports the industry standard DHCP.

MacIP support

MacIP is a protocol specification developed for carrying TCP/IP traffic on AppleTalk-only networks, originally LocalTalk networks. MacIP is today frequently used with AppleTalk Remote Access Protocol (ARAP) to provide mobile users access to TCP/IP network services.

Use of MacIP typically requires a gateway, which strips off the AppleTalk encapsulation and places the IP packet on the TCP/IP LAN. When packets are sent back to the MacIP end-node, the gateway replaces the AppleTalk encapsulation. MacIP gateway support is most frequently offered as an integrated service within a multiprotocol router. The gateway (router) attaches to both an AppleTalk and a TCP/IP network.

Open Transport supports MacIP in the TCP/IP control panel. Once selected, TCP/IP data is encapsulated in AppleTalk packets, and is sent through the selected network interface.

PPP connectivity

With the exception of OT/PPP 1.0f1c9 or later, PPP (Point to Point Protocol) connectivity for Open Transport is currently based on the use of third-party software extensions known as "MDEVs." Early versions of these MDEV extensions may not be compatible with Open Transport. For information about MDEV compatibility, see the Open Transport 1.1 Read Me document.

OT/PPP is implemented using the Open Transport native STREAMS environment.

Memory requirements

Open Transport provides many new features and capabilities to Mac OS customers and, in general, will require more system memory (RAM) than does classic networking. However, the actual memory requirements of Open Transport vary depending upon the networking services in use at a given time. This is different from classic networking, which allocates memory to networking services and keeps it allocated even after networking services are no longer in use.

Factors contributing to differences in memory requirements include:

- Open Transport provides implementations of networking as both 680x0 and native PowerPC code. PowerPC code is typically larger (but also faster).
- Open Transport provides "mixed-mode" applications support, making it possible for both PowerPC native and 680x0 applications to use native networking on PowerPC-based computers.

- Open Transport includes both the new implementations of networking and the libraries required to provide backward compatibility support for the older AppleTalk and MacTCP programming interfaces.
- Open Transport requires less memory on systems with virtual memory enabled. Classic networking has about the same memory requirements regardless of the VM setting.
- Open Transport is based on the cross-platform standard STREAMs environment, which requires more memory than classic networking.

The difference in memory requirements depend upon the configuration of your computer. Some examples of base memory requirements include:

Begin_Table

Computer System	Virtual Memory	Classic AppleTalk & MacTCP	Open Transport
PowerPC-based	On	350K to 450K	200KB
PowerPC-based	Off	350K to 450K	up to 1.2MB
608x0-based	Off	350K to 450K	700KB to 800KB

End_Table

Application compatibility guidelines

=====

Apple has defined three levels of interoperability with Open Transport. The first, "Open Transport Compatible," is used to describe network applications originally developed for "classic" AppleTalk or MacTCP programming interfaces that now take advantage of Open Transport Compatibility Services. These applications automatically gain the benefits associated with the Open Transport control panels. However, they will not realize a significant performance increase on Power Macintosh systems, nor can they take advantage of Open Transport's transport-independence capabilities.

"Open Transport Ready" applications have adopted the new Open Transport APIs. They are PowerPC native, in addition to running on 680x0-based Macintosh systems. Open Transport-ready applications benefit from the new control panels and may also realize a significant performance boost when running on PowerPC-based computers.

The highest category of interoperability is "Open Transport Enhanced." In addition to adopting the new Open Transport APIs and being Power PC native, these applications can be dynamically configured to support AppleTalk, TCP/IP, or serial communication.

Applications that rely on undocumented APIs or examine private data structures in AppleTalk or MacTCP may not be fully compatible with Open Transport. Updated versions of these software products will be required for full compatibility.

Performance

=====

Open Transport is designed to take advantage of the PowerPC processor. For maximum performance, however, networking applications must also take advantage of the PowerPC processor, and should adopt the new Open Transport programming interfaces.

In general, current Mac OS networking applications are written for the 680x0 processor and use the "classic" (680x0-based) networking programming interfaces. These applications can still be used with Open Transport, and may perform somewhat better. Networking applications that are PowerPC-native but not Open Transport-ready may yield better performance, but still fall short of the maximum potential performance because they make use of Open Transport backward compatibility rather than its full capabilities.

Performance improvements will be greater with protocols that use larger datagram sizes. For example, TCP/IP users will see greater improvements than AppleTalk users, because AppleTalk has a fixed and limited datagram size. On high-speed datalinks such as fast Ethernet, FDDI, and ATM, the performance of the network interface card (NIC) driver code is also a significant factor.

Overall performance also depends on the amount of RAM available. Larger packet sizes and higher throughput place increased demand on the buffering system of Open Transport. If Open Transport becomes low on memory, throughput decreases to accommodate the limitation.

Quality Software Bundles: Description (10/96)

=====

Article Created: 16 October 1996

TOPIC -----

This article contains the description for the Apple Quality Bundles which consists of the following different bundles:

- Early Learning Kit
- It's Elementary!
- College in Mind?
- Extreme Fun Pack

DISCUSSION -----

The Apple Quality Bundles are new value-added software solutions for home learning and entertainment. The collection features award-winning programs from leading developers of home learning and entertainment software, and is part of Apple's commitment to offering the best value to its customers, and to utilize its expertise in education to bring learning home. The packs are above and beyond the extensive solutions already packaged with Macintosh Performa computers.

Because these kits supply up to eight programs for one low price, they present an ideal opportunity for Performa owners to expand their learning and entertainment software libraries with proven titles hand-picked by Apple. The kits are designed for preschoolers, elementary school students, college-bound teenagers, and gamers of all ages. Because there are so many programs in each pack, the Quality Bundles provide longevity of use for the family, increasing their value even more.

Early Learning Kit

=====

With eight leading programs included, the Early Learning Kit gives preschoolers a head start in preparing for school. Richly interactive multimedia software helps kids develop basic skills and knowledge, including letter and word recognition, vocabulary, numbers and counting, art, and music.

The software makes learning fun and provides lots of activities for families to share.

Included Software

- Playskool Puzzles by Hasbro Interactive
- Sesame Street, Let's Make a Word by Creative Wonders
- How Many Bugs in a Box? by Simon & Schuster
- Millie's Math House by Edmark
- FisherPrice Sing-Alongs by Davidson
- Putt-Putt Saves the Zoo by Humongous Entertainment
- Jump Start Kindergarten by Knowledge Adventure
- Kids Art Center by Creative Wonders

It's Elementary!

=====

This set of eight engaging, interactive programs helps youngsters ages seven to ten build the knowledge and skills needed in elementary school. Creative multimedia programs cover all the major subject areas, including language arts, math, science, and social studies.

Included Software

- Counting on Frank by Creative Wonders
- What's the Secret? by Imation
- Wide World of Animals by Creative Wonders
- Schoolhouse Grammar Rock by Creative Wonders
- Imagination Express, Destination: Ocean by Edmark
- The Amazon Trail by MECC
- Elroy Hits the Pavement by Headbone Interactive
- Amazing Animation by Vividus

College in Mind?

=====

This bundle of eight top Macintosh programs helps high school students select, gain admission to, and prepare for college or a university, while having fun at the same time. Chock full of resources for doing homework and research, planning college applications, and finances, and hunting for jobs, this kit helps teens get organized and sharpen their test-taking, writing, and interview skills.

Included Software

- U.S. News & World Report, Getting Into College, 1996 Edition by Creative Multimedia
- The Princeton Review, Inside the SAT by The Princeton Review
- Correct Grammar by Softkey
- Monarch Notes on CD-ROM by Thynx
- INFOPEDIA Reference Library by Softkey
- Espresso Calendar by Berkeley Systems
- Resume Maker Deluxe by Individual Software
- You Don't Know Jack by Berkeley Systems

Extreme Fun Pak

=====

Winners of rave reviews and multiple awards, these six programs are guaranteed to transport hard-core gamers into the realm of white-knuckle fun, time after time. The Extreme Fun Pak brings together all the most popular game categories, from first-person flight and space combat adventure to otherworldly role-playing and the classic fun of arcade action.

Included Software

- Marathon 2 by Bungie
- Wing Commander III by Electronic Arts
- Panzer General by Mindscape/SSI
- Flight Unlimited, Limited Edition by Looking Glass Technology
- Entomorph by Mindscape/SSI
- Diamonds 3D by Macsoft

Ordering Information

=====

Note: The Apple Quality bundles will be available from authorized Apple dealers starting October 15, 1996. Although all the programs featured in the bundles are full-featured, except for the Limited Edition version of Flight Unlimited, not all programs come with the complete documentation that would be available if purchased separately. Some have online documentation only, but all come with some kind of documentation and help.

Early Learning Kit

High School Biology Bundle: Description (10/96)

Revised: 10/30/96
Security: Everyone

High School Biology Bundle: Description (10/96)

=====

Article Created: 16 October 1996
Article Reviewed/Updated: 30 October 1996

TOPIC -----

This article contains a description of the Apple Education Series: High School Biology Bundle.

DISCUSSION -----

Educators nationwide have been searching for innovative ways to facilitate science teaching and learning. Today, with the same technology tools used by scientists, biology teachers are creating classrooms that encourage inquiry and reward curiosity. Now Apple has made that easier to do.

The Apple Education Series: High School Biology Bundle provides a Macintosh computer and the Biology Kit with Probes, which includes a rich set of software programs. Spanning the biology curriculum from genetics to ecology, these interactive programs engage students' interest--and they promote conceptual understanding. In addition, the kit contains a microcomputer-based lab (MBL) with a set of physiology probes and a collection of eight technology-based classroom investigations--one for each topic in the basic biology curriculum.

With the Biology Kit with Probes and a Macintosh computer, you'll discover how computer simulations, multimedia, data collection, graphing, model building, and analysis can enhance "hands-on" laboratory activities in biology.

Note: To ensure successful implementation, we strongly recommend initial training (High School Biology Staff Development) for any teacher using the High School Biology Bundle.

More Choices, More Flexibility
=====

Now, when you order a Macintosh computer with one of the Biology Kits, you may also order two other Apple Education Series kits. It's as easy as 1-2-3.

1. Select a computer. Order the featured solution--which includes a Power Macintosh 5260/120 and the kit--or choose one of the other computers listed below and order the computer and kit separately. Refer to the computer data sheets for more details.

2. Choose two other kits. If you wish to order additional Apple Education Series kits, you can find out what's available on the Education Price List and review the contents on their respective data sheets.*

3. Purchase everything at once. The Macintosh computer and up to three kits must all appear on the same purchase order.

Computer Options

=====

Power Macintosh 5260/120 (featured computer)

Equipped with 16 MB of RAM, built-in 14-inch color display, 1.2 GB hard disk drive, 8x-speed CD-ROM drive, stereo speakers and microphone, AppleDesign Keyboard, and mouse.

Power Macintosh 5400/180

Equipped with 16 MB of RAM, built-in tilt-and-swivel 15-inch color multiple-scan display, 1.2 GB hard disk drive, 8x-speed CD-ROM drive, Ethernet networking, video-input/output, stereo speakers and microphone, AppleDesign Keyboard, and mouse; includes a PCI expansion slot.

Power Macintosh 6400/200

Equipped with 16 MB of RAM, 256K level 2 cache, 2.4 GB hard disk drive, 8x-speed CD-ROM drive, Ethernet networking, microphone, AppleDesign Keyboard, and mouse; includes two 7-inch PCI expansion slots; supports 16-bit color for display of up to 32,768 colors on a variety of monitors. (Monitor is sold separately.)

Biology Kit

=====

Curriculum Software

* A.D.A.M. Essentials from A.D.A.M. Software, Inc.

Helps students to learn about anatomy and physiology by allowing them to "dissect" the body from anterior and posterior views, explore major body systems, and visual-ize important concepts through text and animation.

* Astound from Gold Disk, Inc.

Enables students and teachers to integrate all types of multimedia elements into classroom presentations, reports, overhead transparencies, and color slides.

* Biology Explorer from Logal Software Inc.

* ClarisWorks from Claris Corporation

Combines word processing, database, spreadsheet, graphics, presentation, and telecommunications software in one familiar, efficient environment.

* Clip-Art for Science Teachers from Ventura Educational Systems

Provides science teachers with a variety of detailed diagrams that can be added to tests, reports, overhead transparencies, and worksheets.

* Investigating Lake Iluka from Interactive Multimedia, Ltd.

Simulates a coastal lake environment that students can explore. Contains tools for investigating the physical, chemical, and biological characteristics of the ecosystem as well as associated news reports.

* Life Story from Sunburst Communications, Inc.

Explores the discovery of DNA and the struggles of researchers Crick, Watson, and Franklin. Includes segments from the BBC drama, "The Race for the Double Helix," molecular animations, and interviews.

Reference Software

* The San Diego Zoo Presents...The Animals! from Mindscape, Inc. .

* LIFEmap Series (Animals, Animals with Backbones, and Organic Diversity) from Warner New Media

* Grolier Multimedia Encyclopedia from Mindscape, Inc.

Curriculum Investigations

Model investigations on eight topics (basic chemistry, cells, genetics, classification, plants, animals, physiology, and ecology) provide supplemental activities to support an existing biology curriculum. These investigations demonstrate how multimedia, simulations, and computer-based data collection, analysis, and presentation tools can facilitate the fundamental scientific processes of hypothesizing, experimenting, measuring, interpreting, inferring, and communicating. Each investigation includes suggested outcomes, preparation and prerequisites, directions, and curriculum integration and assessment suggestions.

Biology Kit with Probes

=====

This kit includes all contents of the Biology Kit, plus the following:

Microcomputer-based Lab

Connect this microcomputer-based lab and set of physiology probes to your Macintosh computer to conduct experiments involving temperature, pulse, and EKG. The MBL uses the power of the computer to control experiments, gather data, and analyze the results, so your students can concentrate on the underlying principles at work.

Biology Staff Development

=====

Participants in a two-day training session will explore the role of technology in the science classroom and gain a hands-on familiarity with all the materials in the bundle--including the software and probes. Special attention will be paid to the model investigations. Participants will gain a working knowledge of at least one investigation and learn how to apply it to their own classrooms.

Ordering Information

=====

Biology Bundle

Includes Power Macintosh 5260/120 and Biology Kit with Probes--a convenient way to order a hardware/software combination with a single part number.

Without CPU setup: B2816LL/C

With CPU setup: B2818LL/C

Biology Kit

Order No.: T1569LL/E

May be purchased only with a computer.

Biology Kit with Probes

Order No.: B2819LL/B

May be purchased only with a computer.

Power Macintosh 5400/180

Without setup: M5162LL/A

With setup: B2766LL/D

Power Macintosh 6400/200

Without setup: M5427LL/A

With setup: B3043LL/A

Monitor is sold separately.

Biology Staff Development

Order No.: T1570LL/A

Power Macintosh 9500/200:Use HD SC Setup or Drive Setup? (11/96)

Revised: 11/12/96
Security: Everyone

Power Macintosh 9500/200:Use HD SC Setup or Drive Setup? (11/96)

Article Created: 15 October 1996
Article Reviewed/Updated: 12 November 1996

TOPIC -----

I have a Power Macintosh 9500/200 computer, and I need to initialize the hard drive. I thought this computer required Drive Setup, but I could only find Apple HD SC Setup in the Disk Tools folder on the system software CD-ROM disc. Can I use HD SC Setup to reinitialize my hard drive? If not, where is Drive Setup?

DISCUSSION -----

No, you should not use Apple HD SC Setup to initialize the hard drive in your Power Macintosh 9500/200. Apple HD SC Setup was not intended to be included with your computer. Instead, Drive Setup is the supported disk utility for use with all PCI-based Power Macintosh computers, including the Power Macintosh 9500/200. If you have already used HD SC Setup, it should not cause any problems with your computer. However, Apple recommends that you reinitialize the hard drive using Drive Setup.

Drive Setup is included with your computer, but it is on a floppy disk called Drive Setup Software rather than on the Apple Macintosh CD System Software 7.5.3 (Version 5.0). Additionally, in order to properly use Drive Setup, you must use Drive Setup and then run the Drive Setup Updater utility program, which corrects an issue that could prevent your computer from starting up properly.

On the system software CD disc, there is a Read Me file titled, "Where is Drive Setup". This file describes this issue in detail and provides the necessary steps for using Drive Setup.

Open Transport 1.1.1: Component Technologies FAQ (10/96)

Revised: 10/23/96
Security: Everyone

Open Transport 1.1.1: Component Technologies FAQ (10/96)

=====

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1, Component Technologies FAQ (frequently asked questions).

DISCUSSION -----

Question: What technology components comprise Open Transport?

Answer: Open Transport supports LANs and WANs and will integrate serial communications, modems, and remote (dial-up) networking in a consistent model for end-users, network managers, and developers. The Open Transport architecture consists of:

- standards based programming interfaces for applications developers and for network interface controller developers,
- a new cross-platform development model for integration of networking with the underlying operating system,
- a set of dynamic link-and-load memory management services,
- new implementations of MacOS protocol stacks,
- new human interface applications and control panels, and
- a set of backward-compatibility support modules.

Question: What current MacOS technologies and components will Open Transport replace?

Answer: When installed, Open Transport replaces the current MacOS

implementations of AppleTalk and TCP/IP (including the protocols and the "Network", "MacTCP", and "Admin TCP" control panels).

Over time, Open Transport is also designed to replace the Connection Manager and the Communications Resource Manager of the current Communications Toolbox architecture.

Question: Does that mean that Apple is migrating serial communications away from the Communications Toolbox (CTB)?

Answer: Partially, but not entirely. The CTB File Transfer and Terminal Managers continue to be supported and will be preserved in the MacOS 8 release - although on new Open Transport/Serial underpinnings.

Over time, plans call for the CTB Connection Manager and its tools to be phased out in favor of Open Transport. MacOS 8 is expected to provide support for the Connection Manager APIs, although Apple has no current plans to port existing Connection Manager tools other than the Serial Tool to MacOS 8. Apple recommends that developers plan their update to Open Transport/Serial (and away from CTB Connection Manager) to coincide with (or precede) the availability of MacOS 8.

At this time, there are no plans to replace or eliminate the File Transfer or Terminal Manager services.

Question: What standards are implemented in the Open Transport architecture?

Answer: Open Transport brings standards based networking into MacOS with support for:

- the X/Open Transport Interface (XTI), the POSIX compliant API for support of networking applications,
- the Datalink Provider Interface (DLPI), for development of network interface controller (NIC) drivers, and,
- a port of a UNIX System V release 4.2 compatible STREAMS environment for network protocol developers.

Question: Did Apple develop the STREAMS environment for Open Transport?

Answer: To maximize the stability, performance, and robustness of Open Transport, Apple selected Mentat Inc. - the leading supplier of high performance kernel-level network software - to supply the STREAMS environment for Open Transport.

Mentat Portable STREAMS (MPS) is an independent fast, full-featured, multiprocessor safe version of the UNIX System V Release 4 STREAMS environment. Its incorporation into Open Transport provides a reliable platform for protocol development, including Apple's own implementation of a STREAMS based AppleTalk stack. MPS also allows easy porting from other platforms of third party

protocols. MPS is the same implementation of STREAMs found inside many industry standard UNIX operating systems, including those from IBM and OSF, as well as other platforms such as Novell NetWare.

Question: Did Mentat supply other technology to Apple in connection with Open Transport?

Answer: Yes. Mentat supplied the source code base for Open Transport/TCP, and has worked closely with Apple on the development of an archetypal high-performance DLPI driver.

Mentat TCP (MTCP) is a robust implementation of TCP/IP that conforms with all industry standards, and is the basis of another leading workstation TCP stack. It makes a significant contribution to the performance and functionality of Open Transport/TCP.

Question: Is there more information available about Mentat Inc. and its products?

Answer: Mentat maintains a presence on the world wide web at:
<http://www.mentat.com>

Question: What dynamic link-and-load technology is used by Open Transport?

Answer: On 680x0 MacOS systems, Open Transport uses the Apple Shared Library Manager (ASLM) 2.0. On PowerPC MacOS systems, Open Transport is based on a combination of ASLM (for 680x0 applications) and the newer Code Fragment Manager, CFM (for PowerPC applications).

Question: Which protocols are supported by Open Transport?

Answer: Open Transport version 1.1.1 includes implementations of AppleTalk and TCP/IP, and consistent API access to serial communications.

Apple and third parties are investigating or working to add support to Open Transport for Point to Point Protocol (PPP), NetWare (NCP/IPX), Windows 95 and Windows NT (SMB/TCP/NetBIOS), DECnet and LAT. Some of these additional capabilities may be incorporated or bundled with future releases of Apple Open Transport (see Future Directions).

Question: Are there any changes in AppleTalk or TCP/IP with Open Transport?

Answer: Yes. The new Open Transport/AppleTalk and Open Transport/TCP protocol stacks both have been implemented as Open Transport STREAMs modules and as native code on PowerPC MacOS computers. They support the new XTI APIs, and their shared libraries can be dynamically loaded and unloaded as needed.

Both protocols also support dynamic reconfiguration (changed settings without

requiring reboot), and feature new configuration applications offering Basic, Advanced, and Administrator tools. The new configuration applications - AppleTalk and TCP/IP - replace the older control panel implementations - Network, MacTCP, and AdminTCP. For backward compatibility the new applications continue to be stored in the Control Panels folder.

Each protocol stack also offers addition protocol-specific feature enhancements.

Question: When should users update their systems to Open Transport?

Answer: With the availability of Open Transport v1.1, Apple encourages all MacOS System 7.x users with systems meeting the minimum configuration requirements to take advantage of the increased performance and new features provided by System 7.5.3 and Open Transport v1.1.

Question: Does this mean that Apple expects everyone to stop using current AppleTalk and MacTCP?

Answer: Open Transport is designed to replace current AppleTalk (58.x) and MacTCP (2.0.x) on Apple Macintosh and MacOS compatible systems meeting minimum configuration requirements. The transition will happen over time, as developers deliver Open Transport-ready and enhanced applications, as users gain experience with Open Transport, and as Apple continues to enhance Open Transport.

Open Transport is not designed to run on 68000 or 68020 Macintosh systems, which should stabilize on current versions of classic AppleTalk and MacTCP software. If Open Transport is installed on these systems, classic networking will still be selected and loaded at system start-up time.

Developers are strongly encouraged to begin all new development for MacOS using Open Transport.

Question: What files are installed as a part of Open Transport?

Answer: When installed, Open Transport adds the following to the Control Panels Folder:

- AppleTalk - the control panel application replacing the classic Network control panel.
- TCP/IP - the control panel application replacing the classic MacTCP and AdminTCP control panels.

Open Transport adds the following files to the Extensions Folder:

- Shared Library Manager and Shared Library Manager PPC - extensions that implement the Apple Shared Library Manager for 680x0 and PowerPC, respectively.

- OpenTransportLib and Open Transport Library - shared libraries that implement core Open Transport services on PowerPC systems. The first library contains the modules and APIs for PowerPC native applications; the second for 680x0 applications running in emulation on PowerPC systems.
- OpenTptAppleTalkLib and Open Tpt AppleTalk Library - shared libraries that implement Open Transport AppleTalk protocols and services on PowerPC systems. The first library contains the modules and APIs for PowerPC native applications; the second for 680x0 applications running in emulation on PowerPC systems.
- OpenTptInternetLib and Open Tpt Internet Library - shared libraries that implement Open Transport TCP/IP protocols and services on PowerPC MacOS systems. The first library contains the modules and APIs for PowerPC native applications; the second for 680x0 applications running in emulation on PowerPC systems.
- Open Transport 68K Library - shared library that implements core Open Transport on 680x0 systems.
- Open Tpt ATalk 68K Library - shared library that implements Open Transport AppleTalk protocols and services on 680x0 MacOS systems.
- Open Tpt Inet 68K Library - shared library that implements Open Transport TCP/IP protocols and services on 680x0 MacOS systems.

Depending on the specific system configuration, the following Extensions also may be installed:

- Ethernet (Built-In) - code resource to allow access to built-in Ethernet port.
- Serial (Built-In) - code resource to allow access to built-in serial port.

Open Transport documentation is also provided in electronic format:

- Open Transport Guide Additions - AppleGuide database that updates the Macintosh Guide with information about Open Transport (System 7.5.3 only);
- a User's Guide (in Acrobat Reader format) which parallels the printed manual;
- the Open Transport Read Me containing any late-breaking news; and,
- a text file called "Open Transport 1.1 Technical Info" which contains a distillation of this Q&A.

Open Transport 1.1.1: Apple Adoption of OT FAQ (10/96)

=====

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Apple Adoption of Open Transport 1.1.1 FAQ (frequently asked questions).

DISCUSSION -----

Question: When will Open Transport become part of Mac OS?

Answer: Open Transport is a standard component of the Mac OS beginning with System 7.5.3 (System Update 2.0).

Open Transport v2.0 is being developed as an integral part of the Mac OS 8 release; support is planned for all Mac OS 8 platforms, including the Common Hardware Reference Platform (CHRP).

Question: What Apple products will support Open Transport? Will these also be native on Power Macintosh?

Answer: Apple includes or plans to include support for Open Transport in the following products, as well many other unannounced products:

- Apple Remote Access 3.0
- MacSNMP 1.5
- Mac OS 8

Open Transport 1.1.1: AppleTalk Features FAQ (10/96)

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1, AppleTalk Features FAQ (frequently asked questions).

DISCUSSION -----

Question: What are some of the upgraded features of Open Transport/AppleTalk?

Answer: Open Transport/AppleTalk now includes new support for assigned (manually administered) protocol addresses. This allows AppleTalk nodes to be managed using protocol address as a unique identifier. It also may reduce the network traffic associated with AppleTalk's dynamic address assignment features (AARP).

Dynamic addressing continues to be available for those customers who prefer automated address allocation.

Question: AppleTalk preferences, such as the last used protocol address and the selected network interface, have been stored in persistent parameter RAM in the past. How does this relate to the new Open Transport network configurations and manual addressing?

Answer: Under the classic AppleTalk networking architecture, AppleTalk's ON/OFF state, the selected network interface, the previous network (protocol) address, and the previous AppleTalk zone name were saved in persistent memory (parameter RAM) for reuse at boot time. To ensure backwards compatibility, this information is still stored and retrieved on systems using Open Transport/AppleTalk.

However, there are some changes made with Open Transport to accommodate the expanded capabilities of multiple, saved configuration files, and required network settings.

- At boot time, Open Transport reads the current Open Transport/AppleTalk configuration file to determine if AppleTalk should be set to ON or OFF. This value will override the value saved in parameter RAM.
- If the network interface specified in the current AppleTalk configuration file is locked (in other words, it is a required setting) and the specified port is not available or cannot be initialized, AppleTalk will not automatically switch to LocalTalk; instead AppleTalk will remain OFF. The user will receive notification in the event this occurs.

Question: What happened to the "Network" control panel?

Answer: The Network Control Panel has been replaced by the Open Transport/AppleTalk configuration utility (control panel). This change was made to reflect the function of the utility - to configure AppleTalk network connections.

Question: Are there other changes to the human interface for AppleTalk?

Answer: Yes. The AppleTalk configuration utility now provides basic troubleshooting information. For example, the Advanced and Administrator views provide access to the hardware (Media Access Control) address, current AppleTalk router address and the current AppleTalk network number range for the cable. Previously this information was only available through the use of router administration or protocol analysis software.

Question: Are there other changes to AppleTalk of interest?

Answer: Yes. Beginning with Open Transport/AppleTalk v1.1, AppleTalk now includes integrated support for both multinode and multihomed operation, accessible to developers at the API level. Configuration and use of the second, third, or more network interfaces or protocol addresses requires application program support.

Multihoming is the term applied to the capability to communicate using more than one network interface at a time using the same protocol. This term is taken from the idea that the workstation makes a "home" on more than one network at the same time.

Multinode is the term applied to the capability to communicate through more than one network protocol address at the same time on a given network interface, using a single protocol. This term is taken from the idea that the workstation or PC appears to outside parties to be multiple end-nodes on the network.

Question: Earlier information about Open Transport said that AppleTalk could be dynamically loaded and unloaded only as needed, similar to Open Transport/TCP. Is this feature available?

Answer: This capability has been removed from Open Transport at this time. It was not technically feasible to provide this feature without creating compatibility problems with existing applications.

Question: Is Open Transport/AppleTalk "AppleTalk Phase 3"?

Answer: No. Open Transport/AppleTalk is a new, modern implementation of the AppleTalk Phase 2 protocol architecture for MacOS, from the people who invented AppleTalk.

Open Transport 1.1.1: Applications Compatibility FAQ (10/96)

Revised: 10/23/96
Security: Everyone

Open Transport 1.1.1: Applications Compatibility FAQ (10/96)

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1, Applications Compatibility FAQ (frequently asked questions).

DISCUSSION -----

Question: Is Open Transport compatible with existing applications and network extensions?

Answer: Apple and third party developers have announced hundreds of Open Transport compatible applications. Open Transport includes software libraries that provide "backward compatibility" services in four areas:

- to support existing applications that utilize the documented AppleTalk APIs;
- to support existing applications that utilize the documented MacTCP APIs;
- to support MacTCP Link Access Extensions (mdevs) on case by case basis; and,
- to support existing NuBus based network interface cards and drivers.

Note: WinSock compatibility services are provided through third party software, available from NetManage. For more information, please refer to Open Transport and Cross-Platform Issues.

Open Transport compatibility services are available to applications accelerated for PowerPC as well as for 680x0 applications, as it provides the necessary "mixed-mode glue" as part of the Software Developer's Kit (SDK).

Question: What is implied when an application is "Open Transport Compatible"? Does that mean that it takes advantage of new Open Transport features?

Answer: Apple has defined three levels of interoperability with Open Transport. The first - known as Open Transport Compatible - is used to describe a network application originally developed for "classic" AppleTalk or MacTCP, that now takes advantage of Open Transport Compatibility Services. These applications automatically gain the benefits associated with the new Open Transport configuration utilities. However, they will not realize a significant performance increase on PowerPC MacOS systems, nor can they take advantage of Open Transport's transport-independence capabilities.

Open Transport Ready applications are those that have been modified to adopt the new Open Transport APIs (XTI). They are PowerPC native, in addition to running on 680x0 MacOS systems. Open Transport Ready applications not only benefit from the new configuration utilities, but have the opportunity for a significant performance boost when running on PowerPC MacOS.

The third and final category of interoperability is referred to as Open Transport Enhanced. In addition to adopting the new Open Transport APIs and being PowerPC native, these applications have been modified to exploit the transport-independent capabilities of Open Transport, that is, they can be dynamically configured to support AppleTalk, TCP/IP, or serial communications.

Question: How is backward compatibility for AppleTalk implemented?

Answer: AppleTalk applications backwards compatibility is accomplished by intercepting all AppleTalk networking calls at the ".ddp" driver API. Above this protocol layer, applications written to the classic AppleTalk APIs continue to rely on the classic (680x0 based) implementation of AppleTalk. Calls to the ".ddp" driver are translated to the corresponding Open Transport XTI calls and are then passed to the new native implementation of DDP for processing. The process is reversed for incoming packets.

Using this approach, backwards compatibility is very robust - the classic implementations of ADSP, ASP, ATP, NBP, ZIP, and PAP are actually present (vs. simply mimicked). This also decreases the total memory footprint of backwards compatibility as compared to an implementation based on individual adaptation layers for each of the AppleTalk protocols. The primary trade-off of this approach is that applications relying on backwards compatibility do not gain any meaningful performance increases on PowerPC MacOS; essentially only native DDP is actually in use in these cases. (see Figure 1)

Open Transport/AppleTalk also includes broad support for existing applications software and network devices that rely on the Chooser or the Network Control Panel software for selection and configuration, known as "cdevs" and "adevs" respectively.

Question: How is backward compatibility for MacTCP implemented?

Answer: TCP/IP (MacTCP) applications backwards compatibility is accomplished by intercepting all MacTCP networking calls at the ".ipp" driver level. Calls to the ".ipp" driver are translated to corresponding Open Transport XTI calls and then passed to the native TCP/IP stack for processing. The process is reversed for incoming packets.

This approach allows most MacTCP applications to benefit from the native implementation of the TCP/IP protocols on PowerPC MacOS, at least to some degree. While the backwards compatibility layer itself must run as 680x0 code, most of the handling of the packet happens in the new native Open Transport/TCP implementation. The drawback of this implementation is that "warts and all" backward compatibility is somewhat less robust; applications depending on idiosyncrasies of MacTCP or referencing internal MacTCP data structures are likely to need an update. (See Figure 1)

TCP/IP backward compatibility also includes targeted support for select software products that rely on the MacTCP (or Admin TCP) Control Panel software for configuration. Support for these software modules, known as MacTCP Link Access Modules, or simply "mdevs", is more limited than that provided for AppleTalk "adevs", due to certain technical considerations.

Question: Are there other compatibility issues with PCI MacOS systems and existing network software products?

Answer: Certain network software products - such as MacIPX from Novell, PathWORKS (LAT and DECnet) from Digital Equipment Corp. or Thursby Software Systems, and Insignia Solutions SoftWindows - interact directly with the MacOS ethernet hardware, expansion slots, and driver software. With the introduction of PCI and Open Transport to MacOS, these elements have changed substantially; PCI has replaced NuBus, the system Registry has replaced the Slot Manager, Open Firmware has replaced the role of NuBus ROMs, and DLPI has replaced the ".enet" driver API. If not addressed, these changes would have resulted in significant compatibility problems between PCI MacOS systems and these network software products.

To support these types of products, MacOS System Software 7.5.2 (and more recent) includes a compatibility library that allows these products to identify and communicate with the built-in ethernet controller on PCI MacOS systems as if it were a "classic" NuBus ethernet device. This compatibility software emulates not only the necessary low-level ethernet driver calls, but also the Slot Manager and other related APIs necessary to preserve compatibility with these applications.

This compatibility software is limited, however, in that it supports access only to the built-in ethernet adapter of PowerPC MacOS systems with PCI. Thus, existing versions of products such as MacIPX and SoftWindows will not be able to take advantage of PCI network interface options such as token ring, fast ethernet, or FDDI. New versions of these applications will be required to gain full access to all PCI NIC options.

Note that this compatibility module was not available in the original distribution of System 7.5.2 for the Power Macintosh 9500 (with Open Transport

v1.0). This is one of the reasons that customers with 9500s were urged to update to System Enabler 1.1 or greater.

With the availability of System 7.5.3 this compatibility library is included as a part of system software. Customers using MacIPX should note that an updated version of the compatibility library is included as a Custom Install option with the System Update 2.0 installer. For more information regarding this updated library, please refer to the System Update 2.0 release notes.

Question: How is backward compatibility for NuBus network interface cards implemented?

Answer: For 680x0 and PowerPC MacOS systems with NuBus, Open Transport v1.1 will allow use of existing NuBus NICs and drivers. This compatibility is provided by software support mapping DLPI driver calls generated by new Open Transport protocols to corresponding calls to "classic" MacOS LAP Manager, .enet and .tokn APIs.

Question: Are there other known limitations to applications backward compatibility?

Answer: Yes, there are some. Applications that rely on undocumented APIs or examine private data structures in classic AppleTalk or MacTCP will not be fully compatible with Open Transport.

Examples include the MacSNMP AppleTalk and TCP/IP Agents (however, MacSNMP and the Macintosh System Agent are compatible), the Apple Internet Router 3.x and some utilities like MacTCP Watcher and MacTCP Spy.

Updated versions of these software products will be required for full compatibility.

Question: There have been reports of problems with MacX 1.2. Is there an Open Transport compatible X Window System server available?

Answer: Apple MacX 1.5 is compatible with Open Transport and is a recommended upgrade for all customers who have any earlier versions of MacX.

Although not related to Open Transport, there is a known bug in MacX 1.2 that can cause a system crash when running on System 7.5.2.

Question: There have been reports of problems with Apple Remote Access 2.0.1 and Open Transport. What is the status?

Answer: Apple Remote Access 2.0.1 is fully compatible with Open Transport v1.1.

Apple Remote Access 2.0.1 running on a system with the earlier Open Transport 1.0.x releases always operated in the "Remote Only" mode. In that mode, only resources at the remote site would be visible in the Chooser while connected via

dial-up; local resources would reappear when the dial-up link was disconnected.

Question: There have been reports of problems with the use of Open Transport 1.0.x and network protocol analysis tools such as ag Group Etherpeek and Neon Software NetMinder. What is the status of this?

Answer: Open Transport v1.1 includes support for promiscuous mode and raw packet access. Apple is currently working with vendors to assure that ethernet and other NIC driver developers are implementing promiscuous mode support in a consistent manner.

Open Transport v1.0.x did not include support for the DLPI messages necessary to enable promiscuous mode on ethernet hardware. Because applications such as Etherpeek and NetMinder rely on this capability, they could not perform data collection on systems running these earlier versions of Open Transport.

Question: There have been reports of problems with the Apple LaserWriter Bridge and LocalTalk Bridge and Open Transport. What is the status?

Answer: Apple LaserWriter Bridge (LWB) and LocalTalk Bridge (LTB) software were designed to check for a specific version of AppleTalk software. Because Open Transport registers itself as a more recent version, these programs currently will not launch. An update for Open Transport-compatibility is currently underway.

Availability and distribution of these updates will be announced in the near future.

Question: There have been reports of problems with MacTCP Ping and Open Transport. What is the status?

Answer: MacTCP Ping is an unsupported utility developed by Apple Computer specifically for MacTCP. It is not compatible with Open Transport.

Compatible Ping utilities, such as MacPing Pro from Dartmouth, are currently available.

Question: There have been reports of problems with Assistant ToolBox and Open Transport. What is the status?

Answer: Prior versions of Assistant Toolbox (v1.2 and earlier) , which has shipped as a component of the PowerBook Productivity Bundle, were discovered to have a conflict with Open Transport v1.1.

An updated version of Assistant Toolbox is included as a part of System Update 2.0 (System 7.5.3).

Question: There have been reports of problems with At Ease and Open Transport.

What is the status?

Answer: At Ease v3.0.1 and earlier have a conflict with Open Transport. At Ease v3.0.2 and later are compatible.

Open Transport 1.1.1: Availability & Distribution FAQ (4/97)

Open Transport 1.1.1: Availability & Distribution FAQ (4/97)

=====

Article Created: 16 October 1996
Article Reviewed/Updated: 02 April 1997

TOPIC -----

This article is the Open Transport 1.1.1, Availability & Distribution FAQ (frequently asked questions).

DISCUSSION -----

Question: What is the current version of Open Transport, and what are its key features?

Answer: Open Transport v1.1.1. This "rapid response" release is an update to Open Transport v1.1, to address the most pressing customer requests, in advance of the next feature release of Open Transport (currently planned as OT 1.5 - see Future Directions). Open Transport v1.1.1 includes the following updates and new features as compared to the earlier Open Transport 1.1 release:

- now also supports the Performa 5200, 5300, 6200, and 6300 systems;
- includes internal changes to minimize memory fragmentation resulting from dynamic loading and unloading of TCP/IP;
- includes changes to the TCP/IP DNR for interoperability with sites using the load-balancing name daemon;
- includes changes for support of the upcoming Open Transport/PPP release;
- includes all bug fixes available to date.

Question: How is Open Transport v1.1.1 available?

Answer: Open Transport v1.1.1 is built as a stand-alone installer, and is distributed online from a variety of Apple, and Internet sites.

Question: Does System 7.5.3 or System Update 2.0 include Open Transport 1.1.1?

Answer: No. MacOS system software ships with Open Transport 1.1. Open Transport 1.1.1 was not yet available at the time these products went to manufacturing. Future releases of MacOS system software are planned to include the most current release of Open Transport available at the time. However, incremental updates to OT may be provided independantly (such as with OT 1.1.1) to provide responsive customer support.

Question: Does the Open Transport single-user software package contain Open Transport 1.1.1?

Answer: No. The retail software package ships with Open Transport 1.1. Open Transport 1.1.1 was not yet available at the time this product went to manufacturing. Current plans call for the Open Transport software package to be updated with each feature-based release of Open Transport; however, incremental updates to OT may also be provided independantly (such as with OT 1.1.1) as needed to provide responsive customer support.

Question: Are there changes in the system requirements for Open Transport 1.1.1?

Answer: There are no changes from the previous release, Open Transport 1.1, in the memory, processor, or OS requirements (see Open Transport and MacOS System 7.5.3). Installation of Open Transport 1.1.1 requires that a previous version of Open Transport already be installed and (on applicable systems) selected as the active network system via the NSS.

Question: What of the earlier Open Transport 1.1 release?

Answer: Open Transport v1.1 included the following updates and new features as compared to the earlier 1.0.x releases:

- added support for 68030 and 68040 MacOS systems,
- added support for PowerPC MacOS systems with NuBus,
- added support for NuBus, SCSI, and CommSlot network interface adapters,
- offered tuning to optimize performance of high speed datalinks,
- offered tuning to support multiple client, multithreaded server applications,
- added support for multinode and multihomed operation of AppleTalk protocols,
- added support for raw packet access and promiscuous mode, to enable the

development of Open Transport-ready network analyzers and other network management utilities,

- recognized a significantly expanded selection of MacTCP dial-up network extensions (mdevs),
- allowed reconnection of a dial-up TCP/IP session without reloading networking and without system restart,
- provided display of the datalink Media Access Control address for Ethernet and token ring networks,
- provided user notification in the event duplicate AppleTalk or TCP/IP addresses are established,
- automatically converted user's existing AppleTalk and MacTCP setting to Open Transport configuration files during installation (only if Open Transport preferences do not already exist),
- included improved compatibility with Apple Remote Access 2.0.1,
- included improved compatibility with a wider range of DHCP servers,
- provided a basis for future support for PPP-based AppleTalk and TCP/IP remote networking,
- provided a basis for future support for modem and ISDN communications devices,
- included support for MacOS system software System 7.5.3,
- included support for the creation of a "universal system folder",
- included support for the Network Software Selector utility to provide easy transition from classic to Open Transport networking on MacOS systems supporting both,
- offered improved Balloon Help text for System 7 users, and,
- included all bug fixes available to date.

Question: How is Open Transport v1.1 available?

Answer: Open Transport v1.1 is available through a broad range of distribution channels:

- as a no-charge upgrade to customers with existing MacTCP volume license software maintenance agreements;
- as a no-charge upgrade to customers with existing system software volume license software maintenance agreements;

- as a component of MacOS system software release System 7.5.3;
- as a component of MacOS system software update System 7.5 System Update 2.0;
- as a retail software product in single-user software package;
- through an OEM redistribution licensing program from Apple Software Licensing,
- bundled with Apple and third party applications software that are Open Transport-ready; and,
- from select Apple-licensed publishers and Internet Service Providers.

Question: How do volume license software maintenance customers receive Open Transport?

Answer: A master copy of the Open Transport software and documentation is automatically be mailed to the contact of record for customers with active MacTCP or MacOS System Software maintenance contracts.

Question: How could a customer receive a copy of System 7.5.3?

Answer: System 7.5.3 will be pre-installed on MacOS systems beginning in first half calendar 1996. System 7.5.3 will also become available as a shrink-wrap retail product in first half calendar 1996.

Question: How could a customer receive a copy System 7.5 System Update 2.0?

Answer: System 7.5 System Update 2.0 is available through a variety of channels, including:

- On the Internet,
Worldwide Web: <<http://www.info.apple.com/swupdates>>
ftp: <<ftp://ftp.info.apple.com>>
- On the electronic information services: America Online (keyword: applecomputer), and CompuServe (GO APLSUP);
- Through Apple User Groups; and,
- From the Apple Order Center, in floppy or CD update kits. The update is available at no charge plus \$13 shipping and handling. Call U.S. +1 (800) 293-6617, ext. 984 to order.

Question: What is the part number and pricing for the Open Transport single-user software package?

Answer: In the U.S. order number M4252Z/A; the estimated retail price is \$39.

Question: Since Open Transport is included with System Update 2.0 and System 7.5.3, why might a customer want to purchase the Open Transport single-user software package?

Answer: The Open Transport single-user software package is designed for customers running System 7.1.x who are not ready to upgrade to System 7.5.3, yet want to take advantage of Open Transport features. It might also be of interest to customers running System 7.5.3 who want a printed copy of the user documentation.

Question: Is Open Transport localized for non-English speaking countries?

Answer: As a part of MacOS System 7.5.3, Open Transport 1.1 is being localized around the world. Please contact the Apple Assistance Center in your area for details. Availability of localized versions of OT 1.1.1 will vary on a country by country basis.

Question: How is Open Transport available to software developers, publishers, and/or Internet Service Providers (ISPs) for redistribution and bundling?

Answer: Apple offers two different redistribution licensing agreements for Open Transport, designed to meet the needs of publishers, software developers, and ISPs.

The first agreement is designed for Internet service providers, network and communications reference work authors and publishers, and others interested in bundling Open Transport software as an added customer benefit to their product or service offering. This license is based on a sliding-scale per-unit license fee, and requires annual reporting of licenses issued. Interested parties should send electronic mail to SW.LICENSE@apple.com.

The second agreement is designed for software developers with products that adopt the new Open Transport APIs who wish to ship Open Transport as a part of an integrated product installation process. This agreement is based on an addendum to the MacOS SDK, and allows qualified developers to ship the Open Transport run-time environment to end-users as a part of their product.

To qualify, developers must execute the Open Transport License Addendum through Apple Software Licensing, and meet the following requirements:

- have developed an Open Transport-ready or Open Transport-enhanced software product (including applications developed for Apple's NetSprockets game architecture),
- be current subscribers to the MacOS SDK,
- provide Apple advance notice of their intent to ship their Open Transport product(s), distribute the required Open Transport components

only in conjunction with their product(s), and,

- annually report the total number of licenses issued.

Other terms and conditions apply, however, no additional fees (beyond the MacOS SDK subscription) are required for this license. Interested parties can send electronic mail to SW.LICENSE@apple.com.

Question: Will localized versions of Open Transport software be available for developer and ISP licensing?

Answer: Initially the Open Transport redistribution licensing program will only have the U.S. English version of the software available. Licensing of localized versions of Open Transport will depend upon demand and availability.

Question: What of the earlier Open Transport v1.0.x releases?

Answer: Open Transport v1.0.x releases were all designed for use only on the Apple PCI Macintosh systems:

- Open Transport version 1.0, for the Power Macintosh 9500, was focused on offering compatibility with existing networking client applications and on upgrading the feature set and performance of TCP/IP. It shipped only as an integral part of system software with the 9500.
- Version 1.0.1 was a maintenance update, designed to correct a potential problem with data truncation in large file transfers. Open Transport v1.0.1 was distributed electronically, as an update to be applied to an existing installation of Open Transport v1.0.
- Version 1.0.6 added support for the Power Macintosh 7200, 7500, and 8500 systems and addressed bugs discovered since the 1.0 release. Open Transport v1.0.6 shipped as a component of System Software 7.5.2 version 2 on the Power Macintosh 7200, 7500, 8500, and 9500 models.
- Version 1.0.7 included changes to improve performance and compatibility of Open Transport/TCP with third party SLIP and PPP software and with certain Internet Service Providers (ISPs). Open Transport v1.0.7 was distributed electronically, as an update to be applied to an existing installation of Open Transport v1.0.6.
- Version 1.0.8 was also a maintenance release, and included better compatibility with Qualcomm Eudora, Claris EMailer and EMailer Lite, CE Software QuickMail, and Netscape Communications client software, as well as improvements in BootP and DHCP interoperability. Open Transport v1.0.8 was distributed via a variety of information services and a number of Internet sites - as a full installation of Open Transport software.

Question: Why was Open Transport made available on PCI Power Macintosh systems first?

Answer: Starting with the introduction of the Power Mac 9500, Apple moved to adopt industry standards for both network driver software - Open Transport DLPI - and network hardware - PCI. This strengthened the business case for new and existing third party developers who could, as a result, include MacOS on PowerPC in their plans for cross-platform network connectivity products. The Power Macintosh 9500 was the first system to incorporate both of these standards, and has since been followed by additional systems and configurations.

In particular, Apple made the business decision to move to standards for networking on the hardware and software fronts in tandem, that is, PCI and DLPI. This created a dependency that required customers deploy Open Transport with their PCI MacOS systems. It also minimized the work by third parties needed to create drivers for new PCI networking cards. As a result customers have found a broad selection of third party PCI networking options for MacOS.

Open Transport 1.1.1: Cross-Platform Issues FAQ (10/96)

=====

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1, Cross-Platform Issues FAQ (frequently asked questions).

DISCUSSION -----

Question: Will Apple port Open Transport to Windows or UNIX?

Answer: Apple does not plan to port Open Transport to other operating systems. Rather, Open Transport is based on Apple porting three existing, cross-platform industry standards to MacOS. These standards have their roots in the UNIX community and experienced UNIX network developers will find themselves "right at home" when developing for Open Transport.

Question: What about Windows developers? What about Windows Sockets?

Answer: NetManage, the leading developer of TCP/IP protocols and applications for DOS and Windows, now offers Windows Socket tools for MacOS, to provide access to Open Transport/TCP and MacTCP services via the Windows Sockets (WinSock 1.1) API.

NetManage's WinSock for the MacOS is WinSock 1.1 compliant and is being certified by the WinSock Labs operated by Stardust Technologies, Inc., which performs compatibility testing. The SDK for MacOS costs \$250 per license, with free distribution.

For more information, contact NetManage at 1-408-973-7171.

Question: With both XTI and Windows Sockets available for Open Transport, which API should a developer use?

Answer: The choice of API will depend upon a developer's background, experience, and goals. For developers with a background in UNIX, a need for POSIX compliance, or a need to deploy an application across MacOS and UNIX systems, XTI is the logical choice. For developers with a background on Microsoft Windows, or a need to deploy an application across MacOS and Windows, Windows 95, and/or Windows 95 systems, the planned WinSock tools from NetManage will provide an attractive cross-platform alternative.

Apple is committed to XTI and will focus development on transport independence around this API. MacOS developers now using classic AppleTalk or MacTCP APIs are encouraged to move to Open Transport XTI API.

This article is the Open Transport 1.1.1, Developer Adoption FAQ (frequently asked questions).

DISCUSSION -----

Question: Which third party developers support Open Transport?

Answer: Seeding of Open Transport among developers began more than a year in advance of release, and reached more than 5,000 developers. Several hundred developers are actively working with Apple on development efforts.

The following software developers are among those who have announced support for Open Transport to date:

- ACI
- Adobe Systems
- AG Group
- AGE Logic, Inc.
- Asanté Technologies, Inc
- Atomic Games
- Carnegie Mellon University
- CE Software
- Claris Corporation
- Dantz Development
- Delphic Software, Inc.
- Digital Ocean
- EveryWare Development Corp.
- Farallon Computing, Inc.
- Gradient Technologies
- HI Resolution Software
- Hughes Advanced Systems

- IBM
- Intercon Systems, Inc.
- Maxum
- Mentat Inc.
- Metrowerks, Inc.
- Neon Software
- NetManage, Inc.
- NorthWestern University
- Novell
- Pacer Software
- Pole Position Software GmbH
- Progressive Networks
- Quark, Inc.
- Remedy Corp.
- Seaquest Software
- SoftArc
- StarNine Technologies, Inc.
- Starlight Networks
- Systematics Softworks GmbH
- The University of Michigan
- The Wollongong Group
- Thursby Systems Software, Inc
- Vicom Technology
- Wall Data
- White Pines
- WRQ

The following developers have announced support for both Open Transport and PCI on Power Macintosh:

- Asanté Technologies, Inc
- Attachmate
- Creative Solutions
- Dayna
- Digiboard
- Digital Equipment Corporation
- Efficient NW
- Farallon Computing, Inc.
- Focus
- Fore Systems, Inc.
- 4-Sight International Limited
- Hermstedt GmbH
- Innosys
- Interphase
- Newer Technology
- Neutral
- QLogic
- Rockwell
- SAT/Sagem
- SCii Telecom
- Silicon Valley Bus
- Spectra Systems

- Workstation Technologies

Open Transport 1.1.1: For More Information FAQ (10/96)

=====

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1, For More Information FAQ (frequently asked questions).

DISCUSSION -----

Question: How can interested parties get more information on Open Transport?

Answer: Documentation for Open Transport is publicly available by anonymous ftp on the Internet at a number of sites, including
<ftp://seeding.apple.com/ess/public/opentransport/>

Question: Can customers apply to receive pre-release copies of Open Transport for implementation testing?

Answer: The Open Transport Early Access program provided pre-release access to Open Transport v1.1. Since the product is now shipping, pre-release seeding of the Open Transport 1.1 has been discontinued. As plans for future versions of Open Transport develop, Apple expects to offer a similar customer testing and preview program. Announcement of details will occur at the appropriate time.

Question: Can developers apply to receive pre-release copies of Open Transport for development and testing?

Answer: The Open Transport v1.1 developer seeding program reached over 5,000 developers. Since the product is now shipping, pre-release seeding of the Open Transport 1.1 has been discontinued. A new seeding program is anticipated for future versions of Open Transport. Details will be announced at a later date.

The Open Transport software developers kit (SDK) is available as a component of

the MacOS SDK, and is available on the Internet at
<ftp://seeding.apple.com/ess/public/opentransport/>

Question: How can developers get support while developing Open Transport applications?

Answer: Apple Developer Support services have engineering specialists fully trained on Open Transport development and debugging. Access to these engineers is just one of the benefits of the Apple Developer Partner's program.

For more information on Apple's Developer Support services, including information on how to register as an Apple Developer Partner, contact the Macintosh Developer Services Information Line at US +1(408) 974-4897.

For developers not a part of Apple's Developer Support services programs, Apple has assigned evangelism resources to the support of Open Transport. All interested developers are encouraged to contact Open Transport Evangelism by email to opentpt@applelink.apple.com.

Question: Are there general reference sources on XTI, STREAMs and DLPI?

Answer: Sources of information that are applicable to XTI and STREAMs include:

- OSF/1 Operating System: Network Applications Programmer's Guide; Open Software Foundation, Prentice Hall, ISBN 0-13-640145-7
- UNIX Network Programming; W. Richard Stevens, Prentice Hall, ISBN 0-13-949876-1
- UNIX System V Release 4: Programmer's Guide: STREAMs; Unix Press (A Prentice Hall title), ISBN - 0-13-020660-1
- Programming UNIX SVR4.2: Network Programming Interfaces; UNIX Press (A Prentice Hall title), ISBN 0-13-017641-9
- X/Open CAE Specification: X/Open Transport Interface (XTI); X/Open Company, Ltd. (XO/CAE/91/600) ISBN 1-872630-29-4
- Transport Provider Interface Specification, rev 1.5 (92/12/10); UNIX International, OSI Special Interest Group
- Data Link Provider Interface Specification, rev 2.0.0 (91/08/20); UNIX International, OSI Work Group

Open Transport 1.1.1: Future Directions FAQ (10/96)

Revised: 10/23/96
Security: Everyone

Open Transport 1.1.1: Future Directions FAQ (10/96)

=====

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1, Future Directions FAQ (frequently asked questions).

DISCUSSION -----

Question: What is the next planned release of Open Transport?

Answer: Open Transport 1.5 is the next planned release of Open Transport. OT 1.5 is planned to be feature-driven, and is expected for release in first quarter CY1997. Some of the key features planned include:

- AppleScript support in AppleTalk and TCP/IP control panels
- API for developers to access configuration data
- Integrated PPP for AT & TCP
- Multi-homing for AT & TCP
- Multi-node support for AT & TCP
- SNMP support

Question: What about the Apple Internet Router? Will it be revised for Open Transport?

Answer: Apple is not announcing future plans regarding this product at this time.

Question: Will Apple or Novell deliver an Open Transport-ready MacOS client that uses IPX protocols?

Answer: Novell currently offers the NetWare Client for MacOS v5.1, providing access to file, print, and NetWare Directory Services (NDS) using NCP/IPX

protocols. An Open Transport-ready implementation of NetWare protocols and client services is currently under investigation. The two companies are not ready to announce product details or availability at this time.

Question: Will Apple or Microsoft deliver an Open Transport-ready MacOS client that uses NetBIOS/TCP protocols?

Answer: Windows NT AS currently includes strong MacOS connectivity solutions based on AppleTalk protocols. Other protocol options are under investigation at Apple, Microsoft, and with third parties. No additional details are available at this time.

Question: What standards are to be supported by OT/PPP?

- RFC 1661 - PPP
- RFC 1662 - PPP in HDLC-like framing
- RFC 1570 - PPP LCP extensions
- RFC 1334 - PPP Authentication protocols
- RFC 1663 - PPP Reliable transmission
- RFC 1378 - ATCP AppleTalk Control Protocol
- RFC 1332 - IPCP Internet Protocol Control Protocol
- RFC ???? - IPsec
- RFC ???? - DHCP Client ID

Question: What about IP version 6 (IPv6) support in Open Transport?

Answer: IPv6 is an proposed update of the current Internet Protocol (IPv4), part of the TCP/IP suite of protocols used to allow computers to communicate with each other over the Internet. The Internet Engineering Task Force (IETF) is in the process of specifying the standards for IPv6.

IPv6 is being designed to respond to the limitations of IPv4 - including an upcoming shortage of new IP addresses - to allow for the continued expansion of the Internet and deployment on corporate networks. IPv6 also incorporates new functionality to provide security, multimedia support, and plug and play capabilities, features necessary to usher the Internet into the twenty-first century.

At the October 1995 Networld+InterOp trade show, Apple and Mentat demonstrated a prototype of Internet Protocol Version 6 running on Open Transport. The demonstration showed the flexibility of the Open Transport environment - with current IPv4 applications such as Fetch, Netscape, and Web*Star running unmodified with IPv6 support - and showed the benefits of Open Transport's underlying standards based architecture - facilitating code portability. The demonstration also included basic interoperability testing with IPv6 prototype implementations from DEC and HP, using standard IP utilities such as Ping and Telnet.

Apple and Mentat will continue to work together to ensure timely availability of IPv6 for MacOS once the standard has been completed.

Question: Will Open Transport v2.0, for MacOS 8, offer any new capabilities?

Answer: Yes. Open Transport v2.0 is being designed to take full advantage of the new microkernel services available in MacOS 8. As a result, Open Transport networking on MacOS 8 is planned as a set of multithreaded, preemptively scheduled tasks running in protected memory.

To a user, this will mean that networking will be even more robust and higher performance. To a developer, this will mean that a rogue application running in another memory space will not be able to corrupt system level networking task.

In addition, Open Transport v2.0 is expected to incorporate a second generation update to the human interface introduced with Open Transport v1.0.

Current plans call for this release to include support for features such as:

- Configuration selection will be integrated with system level workspaces and the location assistance toolbox;
- Advanced end-users and network administrators will be able to configure a protocol stack for simultaneous support of multiple network connections (multihoming);
- Administrators will find additional trouble-shooting tools (such as Ping, traceroute, local ARP cache, access to local routing tables, and others) integrated with the configuration utilities;
- Support for AppleScript*; and
- Desktop aliases for network configurations to allow double-click reconfiguration of services.

Open Transport 2.0 is also planned to include integrated support for NetWare/IPX, X.25, ATM, and ISDN.

Open Transport 1.1.1: General Information FAQ (10/96)

Revised: 10/23/96
Security: Everyone

Open Transport 1.1.1: General Information FAQ (10/96)

=====

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1, General Information FAQ (frequently asked questions).

DISCUSSION -----

Question: What is Apple Open Transport?

Answer: Apple Open Transport is the modern networking and communications subsystem for the Mac OS. Open Transport is based on industry standards and brings a new level of networking connectivity, control, and interoperability to MacOS systems, while preserving and enhancing the hallmark of the Macintosh and MacOS - built-in support for easy-to-use networking.

Question: What long-range Apple goals are advanced through Open Transport?

Answer: Apple believes that communications and collaboration technologies are integral and fundamental to personal and workgroup computing. With Open Transport our goal is to provide the foundation to make MacOS the best desktop OS for multiprotocol networking, anywhere.

Question: What needs must be addressed to be "the best"?

Answer: Networking and communications technologies are mission critical thus reliability is a base-level requirement. Organizations require interoperability in heterogeneous environments; full compliance with standards is necessary.

High performance is also key. Increasing file sizes often related to the rich media types found in graphics and publishing, multimedia, video production, and technical markets create a demand for effective use of higher bandwidth

communications technologies such as ISDN, FDDI, fast Ethernet and ATM.

Beyond these base-level requirements, network managers, end-users and developers each have additional needs.

- Network managers need networked systems to support a flexible model of administration that accommodates both centralized and decentralized management models.
- Users are typically more interested in communications as a basis for productivity applications. As such, they want networking that is easy to set up and easy to use. This becomes even more important when users are mobile, needing access to networking services from wherever they may be without requiring complex reconfiguration for each connection type and location.
- Developers need to address the broadest possible markets with minimum incremental investment. In short, they need standards based, cross-platform APIs and development tools.

Question: What were some of the key goals driving the development of Open Transport?

Answer: Apple began with two key assumptions: that networking is inherently a multiplatform, multiprotocol proposition; and that customers should not have to start over to achieve networking interoperability. This led us to adopt five key design goals:

- Open Transport must protect customer and developer investments in existing network infrastructure and applications.
- Open Transport must be based on existing cross-platform industry standards.
- Open Transport must provide users with an easy to set-up, easy to use abstraction of the underlying complexity of multiprotocol networking.
- Open Transport must also provide a complementary abstraction of networking and communications services for applications developers.
- Open Transport must offer a flexible run time model - one that lets a specific protocol be configured and selected at run time, rather than linked at compile time.

Security: Everyone

Open Transport 1.1.1: Key Features and Benefits FAQ (10/96)

=====

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1, Key Features and Benefits FAQ (frequently asked questions).

DISCUSSION -----

Question: How can Open Transport benefit users?

Answer: Open Transport provides individual computer users with many benefits. Two of the most immediately visible and important benefits relate to making networking more accessible - that is, easier to configure and easier to use.

For example, Open Transport makes it easy to switch from one network configuration to another. A computer user "on the go" might want to hook up to the Internet in various locations, each requiring a different network configuration. With Open Transport settings for each network location can be stored for easy access and use. Changed settings are available immediately - no reboot of the computer is required to use the new configuration.

Open Transport also integrates on-line help, based on Apple Guide technology, to make it easier for an individual to hook up to an network, with fewer demands on network manager and support resources.

Question: How can Open Transport benefit network managers and organizations?

Answer: Open Transport provides significant new flexibility in setting up network configurations; with Open Transport, the network manager can recommend or require configuration settings for users on the network, or allow users to determine their own settings.

Open Transport also improves support for centralized configuration management.

For example, Open Transport/TCP supports the Dynamic Host Configuration Protocol (DHCP), allowing network managers to administer addressing and other TCP/IP configuration information from a central server.

Question: How can Open Transport benefit developers?

Answer: Open Transport is designed to make it easier and more cost-effective to develop MacOS-applications for a wide variety of customers and markets. With Open Transport, MacOS has built-in networking and communications based on cross-platform industry standards including the POSIX compliant X/Open Transport Interface (XTI), UNIX STREAMs and Data Link Provider Interface (DLPI).

Applications written to support Open Transport can directly support a wide range of networking environments (serial, dial-up network, LAN, and WAN), and multiple protocols (AppleTalk, TCP/IP, serial, and others) from a common code base. This capability is sometime" referred to as transport independence."

Question: What is transport independence? Why is it important?

Answer: Different people judge networking in different ways. End-users focus on what they can do using the network, and tend to select applications based on functionality and ease of use. Network managers are interested in delivering reliable network services in a cost efficient manner. Developers want to create compelling functionality for users, but are strongly influenced by the availability of networking infrastructure.

Unfortunately, with current networking tools and systems developers are forced to tie their applications to specific network infrastructure requirements - driven by their API choices. This creates a potential conflict between individual and organizational needs. If network managers restrict protocols to control support costs, users may not have access to the applications they need. If user require specific applications they may increase support costs for the network manager by "dragging along" specific network infrastructure requirements. Developer are stuck in the middle, making decisions for both users and network managers by selection of an API at compile time.

Transport independence is a concept that breaks this undesirable linkage. When implemented, it allows developers to write to a uniform set of APIs, users to focus on selecting the best applications, and network managers to make independent decisions about network infrastructure, all on an ongoing basis.

Question: What benefits can be realized from transport independent applications?

Answer: For end-users, transport independence brings an increased freedom to select applications that meet their needs, without being concerned with the bits and bytes of networking protocols. For network managers, transport independence allows increased flexibility in designing and controlling infrastructure demands arising from support of end-user applications, that is, the freedom to manage the bits and bytes of networking protocols.

Developers who create transport independent applications will find access to broader markets with incremental resources; code written for the AppleTalk market, for example, can be delivered to TCP/IP markets as well.

Question: How does Open Transport enable transport independence?

Answer: Open Transport brings together four technologies to support the development and deployment of transport independent applications on MacOS:

- a set of look-and-feel guidelines that promote consistency for configuration of network services across protocols,
- a unified set of cross-platform, standards based APIs for all networking and communications protocols; for example, applications can send and receive data over an AppleTalk LAN or the TCP/IP based Internet using the same programming interfaces,
- a dynamic link-and-load architecture and set of protocols; protocols are loaded and unloaded on demand, conserving system resources, and making it possible to substitute TCP for ADSP at application launch time (for example), and
- an addressing and naming support tool box; for example, applications can open a communications end-point by name (that is, "seeding.apple.com" or "printer16:LaserWriter@sales"; Open Transport will automatically provide the appropriate name-to-address mapping services (that is, DNR, NBP, and so on).

Together these support the creation of transport independent applications on MacOS.

Question: Are all Open Transport applications transport independent?

Answer: No. While Open Transport provides the necessary foundation, there are certain guidelines and programming practices required for developers to create transport independent applications. For example, most protocols have many features in common - but also some features that are protocol-specific. If an application depends on a protocol-specific feature, then it will depend upon that protocol as well.

In some cases it may be appropriate or desirable to develop a transport-specific application. For example, an MBone client is currently only useful when communicating using TCP/IP.

Question: Does transport independence imply that an organization can offer "AppleTalk services" without supporting AppleTalk protocols?

Answer: For each service and network environment, protocol and services choices will be determined by a combination of factors; transport independence is only

one of them.

This begins with both the client and the server implementations of the particular service of interest (file, print, e-mail, directory, security, back-up, calendar, and so on) supporting the Open Transport APIs. Next, both the client and server must have the protocol stack(s) of choice installed. Finally, the server application must include some administration utility to allow the network manager to specify the protocol(s) over which application and/or presentation layer services are to be provided.

The user experience for selecting the server (that is, "Choosing", or "name-binding") may vary depending on the underlying protocol. For example, AppleTalk offers a distinctive user experience through the "Chooser" and the underlying NBP/ZIP protocols. TCP/IP offers a substantially different model for name-to-address translation (DNS); NetWare/IPX still another (NDS).

Apple is committed to evolving MacOS networking services, including but not limited to AppleEvents, FileSharing, electronic mail, and AppleShare to Open Transport and to transport independent operation.

This begins with both the client and the server implementations of the particular service of interest (file, print, e-mail, directory, security, back-up, calendar, and so on) supporting the Open Transport APIs. Next, both the client and server must have the protocol stack(s) of choice installed. Finally, the server application must include some administration utility to allow the network manager to specify the protocol(s) over which application and/or presentation layer services are to be provided.

The user experience for selecting the server (that is, "Choosing", or "name-binding") may vary depending on the underlying protocol. For example, AppleTalk offers a distinctive user experience through the "Chooser" and the underlying NBP/ZIP protocols. TCP/IP offers a substantially different model for name-to-address translation (DNS); NetWare/IPX still another (NDS).

Question: In addition to providing for transport independence, how is the Open Transport standards based architecture important?

Answer: Although it might seem that the use and support of standards based APIs is of direct interest only to developers writing applications code, Apple's adoption of a fully standards based architecture for networking also has important benefits for individual users, network managers, and organizations. Some of these include:

- Porting of network protocols, drivers, and applications from other platforms (especially UNIX) to MacOS becomes easier, resulting in an even wider selection of networking software for the MacOS,
- A larger developer community is focused on STREAMs than would be focused solely on the MacOS, making it possible to leverage development efforts underway outside Apple - for example, Apple's demonstration of IPv6 (next generation TCP/IP) on the Macintosh platform in cooperation with Mentat Inc., and,

- Developers experienced in writing high-performance, high-reliability networking hardware and software for UNIX systems can apply their expertise directly to the MacOS, accelerating the availability of similar solutions for MacOS customers.

Open Transport 1.1.1 and MacOS System 7.5.3 FAQ (10/96)

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1 and MacOS System 7.5.3 FAQ (frequently asked questions).

DISCUSSION -----

Question: After installing System Update 2.0 (System 7.5.3) I've noticed that the Ethernet address of a system has changed from 00:A0:40:xx:xx:xx to 00:05:02:xx:xx:xx. Why? Is this due to Open Transport?

Answer: Apple was initially assigned Ethernet MAC (Media Access Control) addresses of 00:08:07:xx:xx:xx. Apple NuBus and on-board Ethernet implementations from 1989 through part of 1995 were given addresses from this range. In 1995, however, Apple began to reach the end of the available addresses in that range, and petitioned the IEEE for an additional vendor code (address range) assignment. We were granted 00:A0:40. Apple began using these new addresses (00:A0:40:xx:xx:xx) in some of our Ethernet implementations mid-year 1995.

MAC addresses are typically stored in an EPROM (erasable programmable read-only memory) on the Ethernet chip set, in "token ring format". This format has each byte stored in bit-reversed order. For example:

Ethernet format (hex):00A040
Binary equivalent: 0000 00001010 00000100 0000
Token ring format (hex):000502
Binary equivalent:0000 00000000 01010000 0010

Some Macintosh systems - the Power Macintosh 7200, 7500, 8500, and 9500 - and some Apple NuBus Ethernet cards had their MAC address unintentionally stored in Ethernet format; not in the standard token ring format. That is, rather than storing the address as 00:05:02:xx:xx:xx and then converting to yield the

assigned address range of 00:A0:40:xx:xx:xx, the addresses were stored as 00:A0:40:xx:xx:xx and would convert to 00:05:02:xx:xx:xx on the wire.

At the same time, however, there was also a bug in the Open Firmware code for these same systems that caused them to NOT convert the address stored in the EPROM. The result was that the intended MAC addresses (00:A0:40:xx:xx:xx) were being used on the wire by these Ethernet implementations, even though they were not stored in the correct format. (A rare case of "two wrongs do make a right".)

MacOS network utilities also access the EPROM to read MAC addresses, however, and correctly assume the token ring format. Thus they convert stored addresses at the application layer before presentation to the user. When running on one of the affected systems, such a utility would report an address of 00:05:02:xx:xx:xx, even though a network analyzer packet trace would show an address in the range 00:A0:40.

Because the Open Firmware bug did not apply to Apple NuBus Ethernet cards with MAC addresses in the new range (Open Firmware is a PCI specific technology), the MAC addresses WERE converted from 00:A0:40:xx:xx:xx to 00:05:02:xx:xx:xx, resulting in the use of unauthorized addresses on the wire. Fortunately, the 00:05:02 range was still unassigned, and these cards did not create interoperability problems.

Upon original discovery of this situation, Apple quickly petitioned the IEEE and was granted the 00:05:02 range. This was in addition to the already approved 00:08:07 and 00:A0:40 ranges.

System Update 2.0 (System 7.5.3) includes a fix for the Open Firmware bug that impacted the Power Macintosh 7200, 7500, 8500, and 9500 systems. Once updated to MacOS System 7.5.3, these systems will now convert their address before use, and as a result appear as 00:05:02:xx:xx:xx on the wire. This change impacted a Open Firmware component, and was not a part of Open Transport v1.1.

Note that because Apple has been granted use of the 00:05:02 range, these PCI MacOS systems now have properly stored and communicated addresses. This change brings consistency to the behavior of all Apple on-board and NuBus Ethernet implementations, and allows Apple and third party network management utilities to correctly read and report these addresses to users without requiring new versions of utility software.

These changes were necessary to assure ongoing standards compliance, and to remedy the compatibility issues with network management utilities. However, they may impact networks including the Apple Ethernet implementations noted above. Specifically, any network access and configuration services which depend upon statically configured MAC addresses will require reconfiguration by the network administrator once System 7.5.3 is introduced into the environment. Such services can include BootP, DHCP, RARP, certain firewall and security products, some routing Access Control Lists, and smart Ethernet hubs incorporating MAC-level security.

The 00:A0:40 address range is now reserved for future Apple expansion, at such time as the 00:08:07 and 00:05:02 ranges are exhausted. This situation did not

effect Power Macintosh 7200, 7500, 8500, and 9500 systems or other Apple Ethernet implementations with physical Ethernet addresses in the original 00:08:07 range.

Question: Does System 7.5.3 require the use of Open Transport?

Answer: System 7.5.3 supports and includes both classic and Open Transport networking.

Doing an Easy Install of System 7.5.3 on an 68030, 68040, or NuBus PowerPC MacOS system installs Open Transport v1.1 and classic networking. Easy Install on a 68000 or 68020 Macintosh will install only classic networking. Easy Install on PCI MacOS systems will install only Open Transport.

Question: Why does System 7.5.3 include both classic and Open Transport networking?

Answer: System 7.5.3 includes both classic and Open Transport networking to support a Universal System Folder, which could provide networking services for any MacOS system, from the Mac Classic to the most powerful PowerPC.

Question: Since both Open Transport and classic networking are included with System 7.5.3, which network software will actually be used?

Answer: The networking software used by System 7.5.3 depends upon four factors:

- the configuration of the system where 7.5.3 was installed;
- an initial stored preference, established at system software installation time;
- the configuration of the system currently being booted, which might be the same as or different from the system where 7.5.3 was installed; and
- the user's change to the stored preference, if any.

Together these factors determine the networking software system loaded at system startup (boot) time:

- Classic networking will load and run when booting System 7.5.3 on a 68000 or 68020 Macintosh, even if Open Transport is also installed;
- Open Transport will load and run when booting System 7.5.3 on PCI MacOS systems meeting Open Transport minimum memory requirements, even if classic networking is also installed;
- Both classic and Open Transport options are available on 68030, 68040 and NuBus PowerPC MacOS systems meeting Open Transport minimum memory requirements. The networking software used at boot time is selected based upon the stored preference.

When System 7.5.3 is Easy Installed on these machines, the initial preference is to load and run classic networking. Open Transport can be enabled using the Network Software Selector utility, discussed below.

If Open Transport is Custom Installed from the System Update 2.0, or installed using the stand-alone Open Transport installer, the initial preference is to load and run Open Transport networking. Classic networking can be enabled using the Network Software Selector utility.

- Classic networking will load and run when booting MacOS systems with less than 5 MB (680x0) or 8 MB (PowerPC) total system memory.

If this constrained-memory situation occurs on a 68030, 68040, or NuBus MacOS system, classic networking will load and run, with full support for AppleTalk and MacTCP.

If this constrained-memory situation occurs on a PCI MacOS system - perhaps due to the definition of a large RAM disk - classic networking will become available, but will be limited to support only for AppleTalk on LocalTalk; no TCP/IP services will be available.

Question: What happens if a boot device is moved to a different system after the preference has been established?

Answer: The stored preference for network software will be honored, if possible, at boot time. Whenever the system configuration being booted meets the minimum requirements for the preferred network software, it will load and run. If the stored preference has been deleted, or is not appropriate for the system being booted, the rules noted above around minimum and recommended memory size, processor, and bus type determine which network software system loads.

Question: Why is the network software preference initially set during system installation time? Wouldn't checking system configuration at boot time be a more flexible way to support the Universal System Folder?

Answer: As described above, a number of system configuration checks are made at boot time - including processor, bus type, and system RAM - and influence the choice of network software when booting a Universal System Folder.

On MacOS systems that support both networking software systems, however, an initial preference is established based on system configuration at installation time. For the majority of users, this system (the installation system) is the same one as where the System Folder being created will be used. In these cases, the update / installation script establishes a preference based on the recommended memory configuration (vs. the minimum required memory, which is still always tested at boot time).

There are two reasons for doing this in this manner:

- Testing for minimum memory requirements at system start-up time assures

a compatible hardware-software combination each time a system is booted. If a system configuration changes to fall below Open Transport's minimum memory requirements - which might happen due to reconfiguration, or by moving an external boot device to a different system - System 7.5.3 automatically drops back to classic networking to provide basic connectivity to the outside world.

- When there is no stored preference, System 7.5.3 selects between classic and Open Transport networking based on the system configurations described above. As this check is based on total memory (including VM but less RAM disk), in the absence of a preference, a seemingly unrelated user action such as turning VM on or off could change the network system used at (next) boot time. For example, enabling VM on an 8 MB system would provide at least 9 MB RAM at next startup, moving the system from classic to Open Transport "unexpectedly"; turning on a RAM Disk could cause another reversal. Thus, setting an initial preference "locks in" a predictable behavior.

Question: How can a user specify a preference for a specific network software system, overriding the system installation preference?

Answer: Apple has developed a utility called the "Network Software Selector" (NSS), which allows a user to indicate a preference for classic or Open Transport networking. Network Software Selector is distributed as a part of System 7.5 Update 2.0, and in other System 7.5.3 configurations - it is located in the Apple Extras Folder.

NSS may not be supplied in all configurations of System 7.5.3; for example, PCI MacOS systems manufactured with System 7.5.3 pre-installed may not have the Network Software Selector utility included, because these systems require Open Transport.

To indicate a preference, the user launches NSS and clicks the radio-button control indicating either classic or Open Transport networking. After quitting NSS, the system must be re-started for the preference to have a change to take effect.

Question: Does the Network Software Selector allow a user to specify a preference for a networking system that is "not valid" for the current system configuration?

Answer: Yes, with the Network Software Selector it is possible to set a preference for classic networking while currently booted on a PCI MacOS system, or to set a preference for Open Transport while booted on a 68000 or 68020 Macintosh. This is designed to allow an administrator to prepare an external boot device with an Universal System Folder that has a configuration different than their own machine.

The Network Software Selector indicates a user preference; the actual network software loaded is determined when the system is booted. If a preference for Open Transport is set but the device is a 68000 or 68020, classic networking

would load, ignoring the preference. If that boot volume is moved to a Power Macintosh 9500, Open Transport would load, as this PCI system requires Open Transport. Move the boot volume to a Quadra 800 and restart; Open Transport would load based on the stored preference.

Question: Can the stored preference be deleted? Why might this be a useful action?

Answer: The preference for network software system is stored as a part of the AppleTalk Prefs file, kept in the System Folder. Deleting this file will also delete the stored preference.

In some support environments it may be useful to create a Universal System Folder that does not include a stored preference. For example, if a network administrator's system is configured differently from the systems found with end-users, the preference set at system software installation time (based on the configuration of the administrator's system) may not be optimum for end-users' systems.

If all of the end user population is configured similarly, the network administrator could use the Network Software Selector utility to modify the stored preference before distributing system software. However, if end-users' system configurations vary widely, deleting the preference would have the effect of deferring the selection of network software to boot time for each individual user.

Should an end-user want to "lock-in" a preference for their system, they would need to simply launch and then close the NSS utility on their machine. This records the network system currently in use as the preference.

Question: When might a user want to use NSS to enable Open Transport, disabling classic networking?

Answer: The Network Software Selector provides System 7.5.3 users an easy way to update to Open Transport networking, without requiring custom system software installations.

Open Transport should be enabled when the user is ready to take advantage of any of Open Transport's features, such as multiple saved network configurations, reconfiguration without restart, support for PowerPC native code; when the user want to run Open Transport-ready or Open Transport-enhanced applications; or when a network manager requires the use of Open Transport to connect to a centrally administered network.

Of course, users that have previously dropped back to classic networking in order to maintain compatibility with an older network application will want to re-enable Open Transport once the application has been updated.

Question: When might a user override the default for Open Transport and specify a preference for classic networking?

Answer: The Network Software Selector provides an easy way to temporarily drop back to classic networking, if needed, on systems that support both networking models. There are two reasons why there might be a call to do so:

- a need to maximize RAM available for running applications, especially if VM is turned off; or,
- a need to run older networking software that is not yet Open Transport compatible.

Before dropping back to classic networking, users are encouraged to check with the application developer to find out if an Open Transport-compatible or Open Transport-ready version of the application is available.

Question: On systems that support both classic and Open Transport networking, how are configuration preferences managed? How does the Network Software Selector interact with these preferences?

Answer: When initially installed, Open Transport AppleTalk and TCP Preferences files are created based on the current settings for classic networking. The Prefs files will each contain a single configuration, entitled "Default". Classic settings are not modified by this installation process.

When booted with Open Transport active, classic networking components and preferences are hidden, and Open Transport initializes with the default configurations. Should the system switch back to classic networking at a later time, Open Transport settings are hidden and the saved classic settings are restored.

Each time the system switches between classic and Open Transport - whether through the use of the Network Software Selector utility or by moving an external boot volume from system to system (where different memory sizes or processor types could cause a switch) - this process will be repeated.

Note that after the initial installation, there is no exchange of configuration information between classic and Open Transport networking. If changes are made in network addressing, and so on while running classic networking, those changes will not be in effect up on switching back to Open Transport. The inverse holds true as well.

For AppleTalk users this would very rarely be any sort of problem, as AppleTalk dynamic addressing and dynamic naming would typically adjust to the system environment at network initialization time.

For TCP/IP users, this could create the potential for some confusion if a user installed Open Transport but continued to run classic networking for a while -- making some configuration changes during that time. Later, when they enable Open Transport networking using the Network Software Selector utility, they'll find that the default Open Transport/TCP configuration reflects their "old" MacTCP settings, not the most recent version.

While there is some potential confusion for users in this behavior, Apple looked carefully at the alternatives, including the possibility of converting information every time the stored preference for network system changed. That approach would have resulted in more frequent and more difficult end-user problems, so was abandoned in favor of the single-conversion at installation time.

Question: On systems that support both classic and Open Transport networking, how are control panels managed? How does the Network Software Selector interact with these files?

Answer: During the boot process, a MacOS system running System 7.5.3 checks for the stored preference for networking software as described above. Once the selection of network software has been determined and validated, the load process also causes the appropriate control panels -- "Network" and "MacTCP" for classic networking; "AppleTalk" and "TCP/IP" for Open Transport -- to be "unhidden". Those associated with the disabled network software are hidden (made invisible).

For the Network Software Selector "show and hide" mechanism to work, it is very important that all files associated with networking be stored in their original and proper locations, with their original file names. Users should not rename these files, nor should they partially install or de-install networking software by dragging copies of files into or out of the System Folder.

Question: Does the Network Software Selector allow running Open Transport on a 68000 or 68020 Mac? If not, why not?

Answer: While NSS can change the stored preference to Open Transport at any time, the preference will be honored at boot time only on those models that can use Open Transport - 68030, 68040, and PowerPC MacOS systems.

68000 and 68020 systems always load and run classic networking. Open Transport was not engineered to support these two older processors as the overall processor and system memory requirements associated with Open Transport's additional features are generally higher than that available in these older systems.

Question: Does the Network Software Selector allow running classic networking on a PCI Power Mac? If not, why not?

Answer: While NSS can change the stored preference to classic networking at any time, that preference will be honored at boot time only on those models that can use classic - 68030, 68040, and NuBus PowerPC MacOS systems.

However, certain MacOS systems with PCI - designed for entry-level markets, where users' networking needs and system memory configurations may be limited - may ship with a default preference to initially support only AppleTalk on LocalTalk using classic networking. On these systems, a user can easily enable Open Transport using NSS when they are ready to take advantage of PCI network

cards, or when they want to gain direct access to TCP/IP networks such as the Internet.

Classic networking is not generally supported on PCI MacOS systems for a number of reasons:

- PCI MacOS systems are based on PowerPC, and only Open Transport provides PowerPC native code;
- Apple simultaneously adopted hardware and software standards for networking by supporting PCI networking via Open Transport's DataLink Provider Interface (DLPI) driver architecture;
- Many of the new features provided by Open Transport, such as multiple saved configurations, reconfiguration without restart, and support for current standards (DHCP, IP multicast, and so on) would have been technically difficult or impossible to retrofit to classic networking; and,
- Open Transport prepares the way for the Copland release of MacOS, by carefully defining an execution model consistent with protected memory and preemptive scheduling.

Question: Can MacTCP be installed on a system running Open Transport?

Answer: With System 7.5.2 it was possible - although not recommended or supported - to install MacTCP on PCI MacOS systems through drag-copy of specific files. Beginning with System 7.5.3, this is no longer possible.

In order to meet the requirements of the Universal System Folder, System 7.5.3 automatically hides files associated with classic networking on systems where Open Transport is in effect (and correspondingly hides Open Transport files on systems where classic networking is running). If a user installs MacTCP on a PCI machine - where Open Transport is always active - the "just installed" MacTCP files will be automatically be hidden by the MacOS immediately upon reboot of the system. This could be confusing to users who may not be aware that this software configuration (MacTCP on PCI machines) is not supported.

If, for any reason, it becomes necessary to reinstall MacTCP on a 68030, 68040, or NuBus PowerPC MacOS system running Open Transport, the end-user must first use the Network Software Selector utility to specify a preference for classic networking and reboot the system. Only after the reboot will MacTCP and the other components of classic networking be visible. The converse would also be true for Open Transport on these machines - only the currently running network system is visible and can be modified or updated.

Question: Does System 7.1.x support both classic and Open Transport networking?

Answer: System 7.1.x continues to support classic networking, and gains the option of running Open Transport v1.1.

Customers running 7.1.x on 68000 and 68020 systems will continue to use classic networking; Open Transport v1.1 will not install on these systems. (System 7.1.x does not support PCI MacOS systems.) Customers running System 7.1.x on 68030, 68040, and NuBus PowerPC MacOS systems can use either classic or Open Transport networking. To enable Open Transport, users must run the Open Transport installer, available as a part of the stand-alone retail distribution package.

Question: Is the Network Software Selector available for System 7.1.x customers?

Answer: No, the Network Software Selector is a feature only found in System 7.5.3.

Open Transport 1.1.1: Network Compatibility FAQ (10/96)

=====

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1, Network Compatibility FAQ (frequently asked questions).

DISCUSSION -----

Question: Is Open Transport interoperable with installed AppleTalk and TCP/IP networks?

Answer: Open Transport 1.0.x is compatible with existing AppleTalk and TCP/IP networks at the "packets on the wire" level. Organizations can introduce one, a few, or hundreds of new MacOS systems running Open Transport into their environment without worrying about interoperability with existing networking services.

Question: There have been reports of problems with the PCI MacOS systems when transferring large files over Ethernet networks. Is this due to running Open Transport software?

Answer: Apple has received reports describing problems transferring large files from PCI Macintosh systems to a variety of AFP servers. The reports state that file transfers stop and a -1072 error is generated. The reports also state that after the problem occurs, both AppleTalk and TCP/IP services are lost and systems must be restarted to restore them. If Ethernet traces are taken, they show that the system disappears from the network.

This problem has been identified as a bug in the Ethernet driver that can exhibit itself if there is a lot of PCI bus activity. In this case, it is possible that Ethernet DMA will start to transmit a packet, and an under run will occur because DMA cannot get enough bandwidth to transfer the entire packet to the Ethernet controller. If this condition occurs more than 10 times in

sequence, the bug in the driver causes it to not recover the buffers associated with the under run. The driver allocates 10 buffers; when they are gone the transmitter will not longer be able to send packets. This problem could occur in some normal situations with a lot of disk activity.

This problem is present only in the built-in Ethernet drivers that shipped with the Power Macintosh 7200, 7500, 8500, and 9500 systems prior to the availability of System 7.5.3. (The first Power Macintosh 9500 systems shipped with v1.0 of this driver; the Power Macintosh 7200, 7500, and 8500 systems shipped with v1.0.1.)

Apple has released an updated driver that fixes this problem, first available as version 1.0.2 of the "Ethernet (Built-In)". The most current version of this driver is included with System 7.5.3.

Question: There have been reports of problems with the Power Mac 7200/90 and its operation on Ethernet networks. Is this due to running Open Transport software?

Answer: Apple has determined that under certain network conditions, independent of the protocol being utilized, a Power Macintosh 7200/90 may fail to send large packets over its built-in Ethernet. The trouble mode is that the 7200/90 may lock-up, time-out, or have extremely slow Ethernet performance under certain conditions. These conditions generally occur only when transferring large packets of data over large and busy networks.

The problem has been isolated to the 7200/90 system logic board, and is limited to the subset of 7200/90 systems with a serial number lower than "XX544XXXXXXX". No other Power Macintosh, Power Macintosh LC, Performa or PowerBook models experience this problem, including the 7200/75. The problem is not related to Open Transport.

Apple has proactively notified customers of this issue, and has instituted troubleshooting procedures to make it easy to determine if a system is impacted. All manufacturing sites have implemented a logic board change and Power Macintosh 7200/90 systems currently available should not be affected by this issue.

If a customer has completed the troubleshooting procedures and finds that their 7200/90 experiences the trouble mode, they should contact their local Apple Authorized service provider or call Apple (1-800-SOS-APPLE in the US) to be advised on how to have the logic board replaced free of charge.

Question: There have been reports of problems with connecting the Power Mac 7200 to token ring networks. Is this due to running Open Transport software?

Answer: Currently, the Apple PCI Token Ring Card will not work with the Power Macintosh 7200. Apple is working on a solution that will provide support for Power Macintosh 7200 models and will advise Apple Authorized Service Providers when that solution becomes available. This problem is due to a bus timing issue and is not related to the use of Open Transport software.

Question: Open Transport doesn't seem to send packets larger than 1500 bytes on a token ring network. Is this normal?

Answer: Due to limitations in Apple's currently available token ring drivers, an artificial limit is imposed on the maximum packet size. This limit is planned to be addressed in a future version of driver software. Open Transport fully supports larger frame sizes.

Question: Is Open Transport compatible with existing Internet Service Provider offerings?

Answer: Open Transport/TCP currently supports dial-up connectivity to TCP/IP networks, including the Internet, through backward compatibility with select third party software modules known as mdevs.

With the appropriate software installed, end-nodes can use either SLIP or PPP to connect to Internet Service Providers and other dial-up IP-access points. Not all versions of all mdevs are supported by Open Transport compatibility services, thus it is important that recommended versions of software be installed for the greatest level of compatibility.

It is also very important that TCP/IP addressing and other configuration information be properly configured. As there is a new human interface provided by Open Transport/TCP, there are some differences in the process as compared to the older MacTCP software. In particular, when running TCP/IP over a SLIP or PPP link only, it is recommended that the "router address" and "subnet mask" fields be left blank in the TCP/IP control panel.

Question: Which MacTCP dial-up extensions ("mdevs") are supported by Open Transport/TCP?

Answer: Apple has worked together with third party developers to test a variety of mdevs with Open Transport 1.1. The following mdevs, when installed, will appear listed by name in the "Connect Via:" pop-up menu in the TCP/IP control panel:

- FreePPP - Apple and the developer recommend that you use version 1.0.5 or more recent.
- InterPPP II - Apple and the developer recommend that you use version 1.1 or more recent.
- InterSLIP - Apple and the developer recommend that you use version 1.0.1 or more recent.
- MacSLIP - Apple and the developer recommend that you use version 3.0.2 or more recent.
- MacPPP - Apple and the developer recommend that you use version 2.1.4 SD or more recent (version 2.2.0 is not recommended).

- SonicPPP - Apple and the developer recommend that you use version 1.0.2 or more recent.

Question: Earlier versions of this Q&A listed VersaTerm SLIP as compatible with Open Transport. What is the current status?

Answer: After additional testing and field experience, Apple and Synergy Software have jointly determined that there is a compatibility problem between the current releases of VersaTerm SLIP and Open Transport. Apple and Synergy are continuing to investigate and work towards a solution.

Question: Are any other mdevs recognized by Open Transport?

Answer: There are a number of third party PPP mdevs that are all derived from a common technology base, FCR PPP. The derivative implementations have not been individually tested by Apple, although Apple and FCR have worked closely together in testing the core technology.

Each of these derivatives registers with Open Transport using the same "signature". When any one is installed, it will appear as "TCP/IP PPP" in the menu, rather than as it's own brand name. These include:

- About Software FCR PPP
- 4-Sight 4-Sight PPP
- InterCon InterPPP
- Network Telesystems NTS PPP
- Pacer Software PacerPPP
- SAT/SAGEM PlanetPPP
- Tribe TribePPP
- White Pine Software WhitePine PPP

Users are always encouraged to check with the third party developer of interest for the most recent information on versions and compatibility.

Question: Is PPP connectivity distributed as a bundled component of Open Transport v1.1.1?

Answer: Not at this time. Apple is developing an Open Transport implementation of PPP, for support of TCP/IP and AppleTalk protocols. When available, current plans call for OT/PPP to be included with future distributions of Open Transport.

Question: Does Apple currently offer a solution for SLIP or PPP dial-up to the Internet?

Answer: Yes. The Apple Internet Connection Kit (AICK) is a selection of the most popular Internet applications from third party companies, including the Netscape Navigator and RealAudio Player from Progressive Networks, as well as Claris

Emailer Lite.

AICK 1.1 includes MacPPP 2.5 (Version 1.0 included MacPPP 2.1.4) along with the Apple Internet Dialer - software designed to make it simpler for MacOS customers to register with a qualified Internet Service Provider (ISP) and get connected to the Internet. To help users work with their Internet applications, the Apple Internet Connection Kit includes AppleGuide software for on-line assistance.

Question: Does the Apple Internet Connection Kit require Open Transport?

Answer: The Apple Internet Connection Kit (AICK) can support either MacTCP 2.0.6 or Open Transport/TCP 1.x. Customers should update their copy of AICK with the Apple Internet Dialer 1.1. This revision of the dialer is fully compatible with Open Transport 1.1 and System 7.5.3

Question: What is MacPPP 2.5 / 2.1.4? Is it available on the Internet?

Answer: MacPPP 2.5 and 2.1.4 are derivatives of the MacPPP 2.1.x SD versions of Merit's PPP. They include code contributed by Apple engineering to enhance compatibility with Open Transport/TCP.

Question: There have been reports of problems with Open Transport, PPP, and the use of Virtual Memory. Is Open Transport compatible with Virtual Memory?

Answer: Open Transport fully supports the use of virtual memory. However there were some problems with MacPPP versions 2.1.x SD and versions of FreePPP prior to 1.0.4; MacPPP 2.5 and FreePPP 1.0.5 have corrected these problems. Users are advised to update to the most recent version of the software, or temporarily turn VM off.

Question: Are there known limitations to backward compatibility mdev support?

Answer: Due to some shortcomings in the Open Transport 1.0.x backward compatibility services, there were some additional limitations with earlier versions of Open Transport:

- Some mdevs were not be able to auto-dial, that is, automatically connect to the service provider when launching a TCP/IP application. This has been addressed with updated versions of mdevs.
- Once a TCP/IP application launched and used a SLIP or PPP mdev, use of a different mdev could have required restarting the Macintosh. Disconnecting from and re-dialing a service provider could also have the same effect. This has been corrected in Open Transport v1.1.

Question: Are there differences in configuring Open Transport/TCP and MacTCP for Internet Service Providers (ISPs)?

Answer: Some ISPs do not strictly follow standards, which call for assigning end-node IP addresses on the same subnet as the router (gateway). Open Transport strictly enforced this requirement in versions prior to 1.0.7. In versions since OT 1.0.7 (including 1.1), the TCP/IP Control Panel automatically generates a compatible router address to facilitate connectivity to the ISP. To take advantage of this feature, the user simply leaves the router and subnet mask fields empty when configuring Open Transport/TCP for dial-up access.

Question: If a user needs an updated copy of an mdev, where can they find the software?

Answer: Sources for software vary, as some products are commercial, and some are shareware or public domain.

- FreePPP is shareware and can be found on a variety of Internet sites; typically at "info-mac" mirror sites in the comm/tcp directory. A list of info-mac mirror sites can currently be found at:

<http://www.mcp.com/hayden/iskm/info-mac-mirrors.html>

Some sites where FreePPP can be found currently include:

<ftp://mirrors.aol.com/pub/info-mac/comm/tcp/>

<ftp://mirror.apple.com/mirrors/Info-Mac.Archive/comm/tcp/>

- InterPPP and InterPPP II are commercial software products. For availability and ordering information contact InterCon Systems, US +1(800) 468-7266 or (703) 709-5500.
- MacSLIP is commercial software developed by Hyde Park Software. For availability and ordering information contact TriSoft, US +1(800) 531-5170 or (512) 472-0744.
- VersaTerm SLIP is commercial software developed by Synergy Software. For availability and ordering information contact Synergy, US +1(610) 779-0522.
- MacPPP (v2.1.4) is available as a part of the Apple Internet Connection Kit, Apple Computer Inc., US +1(800) 462-4396 for fax information or +1(800) 538-9696 to locate an Apple reseller near you.

Open Transport 1.1.1: Network Interface Options FAQ (10/96)

=====

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1, Network Interface Options FAQ (frequently asked questions).

DISCUSSION -----

Question: What network interface options are available with Open Transport?

Answer: Open Transport v1.1 supports PCI and NuBus NICs, CommSlot and built-in (LocalTalk and Ethernet) network adapters. For models without slot-based expansion options, Open Transport v1.1 supports SCSI-attached network adapters, including PC Cards compliant with the Macintosh PC Card specifications.

NIC options available for Open Transport include Ethernet, token ring, fast Ethernet, FDDI, and ATM.

Question: What about dial-up network connectivity solutions?

Answer: For connectivity to AppleTalk networks, Open Transport v1.1 and greater is fully compatible with Apple Remote Access v2.0.1 client and personal server.

For dial-up connectivity to TCP/IP networks including the Internet, Open Transport recognizes third party MacTCP software extensions (known as mdevs), providing SLIP or PPP connectivity. See Network Compatibility for more information.

Apple has now reached the beta milestone with a new, PowerPC native implementation of PPP for Open Transport. This software, OT/PPP, will support TCP/IP connections in its first released version, with AppleTalk on PPP (ATCP) in a future version.

Question: Does Open Transport influence or restrict the choice of modems for dial-up communications?

Answer: No. Open Transport provides a new, consistent programming interface for serial communications from within system software. However, there are no changes in the external behavior of the serial ports based on the presence or absence of Open Transport on a system.

Open Transport 1.1.1: Network Planning & Admin FAQ (10/96)

=====

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1, Network Planning & Administration FAQ (frequently asked questions).

DISCUSSION -----

Question: Does Open Transport offer network managers more control over Mac OS networking?

Answer: Yes. Open Transport allows network managers to specify details of the network connection and configuration in advance, via a "preferences" file. These configurations may contain a mixture of user-provided information and network manager recommended and/or network manager required settings. Recommended data provides a default for the end-user, while required configuration data is locked with an administrator's password.

Open Transport configurations can be prepared on one machine and distributed to other systems. To support this, the Open Transport configuration utilities allow a configuration to "exported" and "imported". Exported configurations can be distributed via electronic mail, a file server, or even "sneaker net".

Question: Will Open Transport require organizations to make changes in network administration, planning, or design?

Answer: The first Open Transport protocols - AppleTalk and TCP/IP - offer new features that give a network manager more flexibility and control. Some of these features, when implemented in a network environment will require additional thought and planning by a network manager.

In particular, Open Transport/AppleTalk adds support for the use of static (manually assigned) AppleTalk node addresses. If implemented, a network manager

may prefer to assign addresses based on a pre-designed protocol address management plan. Open Transport/TCP adds support for the Dynamic Host Configuration Protocol (DHCP). DHCP allows network managers to allocate IP addresses and other configuration information from a DHCP server. Optimum deployment of DHCP services within an enterprise requires planning.

In order to better conform to applicable standards, Open Transport/TCP also has somewhat more rigorous requirements regarding the content and format of the local HOSTS file. This could require some updating of existing MacTCP-compatible host files. See TCP/IP Features for more information.

Question: Does the use of AppleTalk manual addressing increase the requirement for network administration?

Answer: Open Transport/AppleTalk offers network administrators a choice. Sites that prefer to have the network infrastructure automatically assign unique protocol addresses can continue to rely on AppleTalk Address Resolution Protocol (AARP). Sites that find advantage in having fixed and well-known protocol addresses for each end-node can implement manual addressing.

When manual addressing is selected there will be a requirement to allocate and assign the initial protocol addresses, which will subsequently be "locked". Some administrators may prefer to do this allocation based on a central numbering plan, creating individual configuration templates (recommended or required settings) for each user. Others may prefer to allow the network to determine the initial address configuration (that is, use dynamic addressing once), and then lock the uniquely assigned addresses after initialization.

It is important that all nodes on each individual AppleTalk subnet (a given cable segment assigned a unique network number or network number range) be administered consistently - either all with dynamic addressing or all with pre-assigned static addresses. This avoids a potential conflict between a new dynamic node acquiring an address assigned to an off-line, manually-addressed node. Administrators can enforce the addressing policy for a subnet by locking the addressing mode in the "dynamic" or in the "manual" state. As an administrative precaution, however, Open Transport/AppleTalk does continue to check for the presence of duplicate protocol addresses on the LAN when static addressing is configured.

Question: Are there other benefits that arise from the new support for AppleTalk manual addressing?

Answer: Yes. Manual configuration of static AppleTalk addresses supports MacOS products that utilize WAN datalinks where non-full-mesh topologies are important. This includes datalinks such as Frame Relay, SMDS, and ATM.

Question: Does Open Transport/TCP support BootP?

Answer: Yes. Open Transport v1.1 fully supports Boot Protocol (BootP).

With Open Transport v1.0.x, there was an error condition in which Open Transport would fail to accept a BootP Reply if it were sent to the unicast (subnet broadcast) address, that is, xxx.xx.x.255; replies sent to the all-nets broadcast address (that is, 255.255.255.255) were handled properly. Both situations are correctly handled by Open Transport v1.1.

Open Transport 1.1 now also supports BootP gateways located 1 or more hops away. Earlier versions of Open Transport required that the BootP gateway be zero hops away.

Question: Which DHCP servers are supported by Open Transport/TCP?

Answer: Apple's implementation conforms to the current versions of the applicable specification documents (RFCs). To date, Open Transport/TCP has been tested with the following DHCP server implementations:

- Competitive Automation,
- FTP Software <http://www.ftp.com>
- Hewlett Packard HP-UX <http://www.hp.com>
- Microsoft Windows NT Advanced Server
- Silicon Graphics <http://www.sgi.com>
- Sun Solaris and SunOS <http://www.sun.com>
- TGV <http://www.tgv.com>

Question: Does Open Transport/TCP support DHCP address leases?

Answer: Yes. Open Transport/TCP fully supports DHCP address leases. Open Transport/TCP will automatically attempt to renew any address lease that reaches it's renewal interval, which defaults to half of the lease's lifetime. (The Renewal Interval may be configured to a different value by making changes to the configuring DHCP server). Renewal will be attempted regardless of how many times the lease has already been renewed.

Should an interface's IP address lease expire, the interface will be closed down.

Question: Are there interoperability issues of note regarding DHCP servers?

Answer: Some DHCP servers require padding to a fixed packet size; other servers do not accept padded packets. Open Transport 1.1 and greater automatically adapt to the type of DHCP requests that a given server accepts, while earlier (1.0.x) versions sent non-padded packets.

Network managers should also note that Open Transport 1.1 and greater support DHCP gateways located one or more hops away. Earlier versions of Open Transport required that the gateway be zero hops away.

Question: Can Open Transport/TCP act as a DHCP client to a Windows NT Advanced Server?

Answer: Yes. With Open Transport v1.1, MacOS clients are fully interoperable with the Windows NTAS DHCP server.

Macintosh clients running earlier versions of Open Transport (1.0.x) could experience some of the following interoperability problems due to differences between the Microsoft implementation and that of a typical UNIX server.

- Clients running Open Transport v1.0 or v1.0.1 were not able to acquire leased IP addresses.

This was due to unusually long reply-time-out values used in the NTAS implementation. Open Transport v1.0.6 was changed to accommodate NTAS behavior in this regard.

- Clients running Open Transport versions prior to v1.0.8 would be incompletely configured via DHCP.

NTAS sends only IP address, IP address lease information, the configuring server's IP address, and a subnet mask. Investigation revealed that other configuration options entered in the NT DHCP server's database (default gateway address, domain name server addresses, domain name, broadcast address, and so on) were not sent unless specifically requested by the client using the DHCP Parameter Request List option.

Apple believes that requiring use of this option in order for the client to be properly configured is contrary to the DHCP server specification described in RFC 1541 (Dynamic Host Configuration Protocol), and it appears to be unique to the NTAS implementation. However, in interest of interoperability, Open Transport v1.0.8 and v1.1 use the Parameter Request List option to request default gateways, DNS servers, domain name, subnet mask, and broadcast address. This permits Open Transport/TCP clients to be fully configured by these servers, at the expense of a few additional packets on the wire during the initialization phase.

Question: Can Open Transport/TCP act as a WINS client to a Windows NT Advanced Server?

Answer: No, not at this time. The Microsoft WINS server is dependent on Microsoft extensions to TCP/IP (requiring NetBIOS support) that provide some automation for assignment and registration of IP host and domain names. The Internet Engineering Task Force (IETF) is developing a cross-platform industry standard technology for dynamic registration and look-up of IP names through the Dynamic Service Location working group. Apple has no current plans to implement the WINS extensions. Instead, we are fully committed to implementation of the applicable IETF standards as they emerge. We welcome customer feedback on this topic - should sufficient demand for a WINS client materialize, we'd be open to exploring this issue. A future MacOS WINS client would be dependent upon Microsoft releasing sufficient technical detail regarding their proprietary extensions to IP to make an interoperable implementation possible.

Question: When installing and configuring Open Transport, are there any additional issues of note for network managers?

Answer: The following comments have been developed based on feedback from customers.

- Because the new domain name resolver supplied with Open Transport/TCP is both more capable and more standards compliant than the one included with MacTCP, configuration changes may be desirable or necessary. For example, although common practice in configuring MacTCP, it is no longer necessary to repeat the primary DNS server address in the configuration.
- Network managers should note that although the TCP/IP control panel can properly receive and utilize multiple gateway and name server addresses from a DHCP server, only the first one returned has been displayed in the TCP/IP control panel. This has been resolved in OT 1.1.1.
- Error -3205 can result if the user has manually modified (moved, renamed, or deleted) files installed by Open Transport. Both the Shared Library Manager and Shared Library Manager PPC files must be present on a PowerPC MacOS system. In general, users should not attempt to modify the OT installation through any means other than the Apple supplied installer scripts.
- Users are occasionally encountering an error message like 3Cannot open connection to DNS Name Server2 when trying to run classic MacTCP applications. This can result if the user has manually modified (moved, renamed, or deleted) files installed by Open Transport. The MacTCP DNR file must remain in the System Folder at the root level for backward compatibility to function.
- With System 7.5, TCP/IP support was included but was not automatically installed (it required a Custom Install action). As of System 7.5.3 and Open Transport, TCP/IP services are always installed. However, if there are no MacTCP preferences on the target disk, TCP/IP is installed with a default configuration specifying configuration via MacIP in the current AppleTalk zone, but it is set to 3Never Load2. To enable TCP/IP, use the TCP/IP Control Panel in the Advanced or Administrator mode and select the Options dialog.

Open Transport 1.1.1 and Servers FAQ (10/96)

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1 and Servers FAQ (frequently asked questions).

DISCUSSION -----

Question: What role does Open Transport play for servers?

Answer: The Open Transport architecture is designed to provide server applications: file, print, database, e-mail, directory, and other: with a foundation for higher performance and for more flexible configuration, while maintaining the historical differentiation of MacOS servers - ease of configuration and administration.

Question: How will Open Transport enhance server flexibility?

Answer: Open Transport introduces the capability of activating more than one network connection at the same time, using the same networking protocol. This capability is known as multihoming, and enables servers to support more clients, to offer greater total performance, and to increase the reliability of mission critical applications.

Open Transport also enables the development of transport independent applications. This will be especially valuable for server applications which need to be deployed in AppleTalk, or TCP/IP, or NCP/IPX, or other protocol environments.

Question: How will Open Transport enhance server performance?

Answer: Servers, as network-aware applications, gain access to the higher

performance PowerPC native implementation of networking protocols that Open Transport provides. To exploit this performance opportunity, server applications must be accelerated for PowerPC and must utilize the new Open Transport XTI APIs.

Severs will also benefit through access to new high-speed PCI datalink implementations such as fast Ethernet and ATM.

Question: Will Apple's server products such as AppleShare exploit Open Transport features?

Answer: Yes. AppleShare 4.2.1 is the first version of AppleShare to be both PowerPC native and Open Transport ready. It takes advantage of other Open Transport features as well, including support for multihoming.

Question: Are PCI MacOS systems with Open Transport recommended as application servers?

Answer: Apple recommends that server application developers adopt Open Transport v1.1 as the basis for new network applications development as soon as is possible within their product life cycles. As these updated versions of server software become available customers will find that the combination of PCI, Power Macintosh, and Open Transport makes a great platform for flexible, high-performance network applications.

It should also be noted that Apple generally recommends the Apple Workgroup Server product family, rather than re-purposed desktop hardware, for use as server platforms.

Open Transport 1.1.1: Performance FAQ (10/96)

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1, Performance FAQ (frequently asked questions).

DISCUSSION -----

Question: Is Open Transport native on PowerPC MacOS? Does this make networking faster?

Answer: Open Transport is written to take advantage of the PowerPC processor - it is native code. This provides the necessary foundation for significantly increased networking performance in MacOS. To realize the performance gains at the application level, however, it is equally important that networking applications also be accelerated for Power Macintosh, and that applications adopt the new Open Transport XTI programming interfaces.

The compatibility services for existing AppleTalk and TCP/IP applications run as 680x0 code in emulation on Power Macintosh. This protects a customer's investment in networking applications, but also obscures - or in some cases, outweighs - the underlying performance increases from the native protocol implementations.

Question: Does Open Transport PowerPC native code include drivers for Macintosh onboard Ethernet

Answer: PCI Power Macintosh systems ship with a PowerPC native DLPI driver for built-in Ethernet Power Macintosh 6100, 7100, and 8100 models currently have 680x0 drivers.

Question: Will existing networking applications see performance improvements

with Open Transport on PowerPC MacOS systems?

Answer: In general, current MacOS networking applications are written for the 680x0 processor and use the classic networking programming interfaces. These are not likely to see performance boosts with Open Transport, as most of the performance potential comes from the move to native code for the PowerPC processor. Even for PowerPC native applications, use of the backward compatibility libraries offsets most of the performance gains in the low level protocol handling.

Users that select PowerPC native applications that are Open Transport-ready will realize the greatest performance gains. Performance of specific network applications may also be significantly influenced by the underlying processor speed of the system. Customers with demanding, network I/O intensive applications should give strong consideration to the higher performance PowerPC MacOS systems.

However, even with existing applications using backward compatibility, TCP/IP users are likely to see some performance improvements with Open Transport. This is because of the differences in the way compatibility is provided for MacTCP vs. AppleTalk, and differences in the two protocol architectures.

Question: Will networking applications see performance improvements with Open Transport on 680x0 based applications?

Answer: Not in general, as most of the potential for increased performance with Open Transport comes from the move to PowerPC native code. However, users may find that Open Transport TCP exhibits superior performance to MacTCP, especially under adverse networking circumstances (slow links, noisy lines), due to its more robust implementation and more sophisticated error handling and recovery.

Question: When will new or updated applications that support the native Open Transport APIs become available?

Answer: Applications that are PowerPC native and Open Transport ready are available now. Users are urged to contact the specific third party vendor of interest for more details on their specific products.

Question: How is Open Transport performance being measured?

Answer: Apple has established plans for measuring the performance of Open Transport and related system components through four benchmark test suites:

- SpudPPC - this low-level benchmark tool focuses on measuring the raw throughput potential of Open Transport. It supports both AppleTalk and TCP/IP protocols, is PowerPC native code, and uses Open Transport programming interfaces. Because it measures point-to-point, memory-to-memory data transfers, it most directly measures the performance of Open Transport.

Because this test has the most direct access to Open Transport (the application layer is "thin"), and because it is fully accelerated for PowerPC, this benchmark will generally indicate an upper bound on the performance potential of Open Transport.

- AppleShare file copy - this end-user benchmark focuses on measuring the throughput of the AppleShare client while drag-copying a file from the MacOS desktop using the Finder. It is specific to the AppleTalk protocol suite, runs in 680x0 emulation, and depends upon backward compatibility services to access Open Transport networking. Because it measures user-perceived throughput of a complete application chain, this test only indirectly measures the performance of Open Transport.

Because this test depends upon emulated code, backward compatibility, and AppleTalk protocols, this benchmark will generally indicate a lower bound on the performance potential of Open Transport.

- Fetch 3.x - this end-user benchmark focuses on measuring the throughput of the popular ftp client, Fetch. It is specific to the TCP/IP protocol suite, runs as PowerPC native code, and uses Open Transport programming interfaces. Because it measures user-perceived throughput of a complete application chain, this test only indirectly measures the performance of Open Transport.

Because this test is PowerPC native, Open Transport ready, and is based on TCP/IP protocols, this benchmark will generally tend toward the upper bound on the performance potential of Open Transport.

- ZD Labs NetBench 4.0 - this suite of benchmarks is designed to test file server implementations. It is specific to the AppleTalk protocol suite, runs in 680x0 emulation, and depends upon the File System and backwards compatibility services to access Open Transport networking. Because it measures user-perceived throughput of a complete client-server environment, this test only indirectly measures the performance of Open Transport.

Because this test depends upon emulated code, backward compatibility, and AppleTalk protocols, this benchmark will generally indicate a lower bound on the performance potential of Open Transport. However, because it interacts with an AFP server - which may be PowerPC native and Open Transport ready - it can be useful in measuring the multi-client scalability of file server implementations built on Open Transport.

Only a combination of tests can provide good coverage, as user-perceived networking performance is heavily influenced by a combination of a number of MacOS components including the file system, the Finder, driver code, and the applications used to move data across the network.

Question: How much faster will native Open Transport applications be?

Answer: Networking performance is influenced by many factors. As noted elsewhere in this document, customers will see the highest performance when using PowerPC

native applications that fully support Open Transport APIs.

Performance potential will be greater with protocols that use larger datagram sizes, such as TCP/IP, than with AppleTalk which has a fixed and limited datagram size. On high-speed datalinks such as fast Ethernet, FDDI, or ATM, both the performance of the network interface card (NIC) driver code and the number of allocated buffers are significant factors.

Open Transport has been clocked at over 9.3 Mbps using the SpudPPC tool. A pre-release version of a third party implementation of NFS was benchmarked at over 8.4 Mbps. Both figures approach theoretical maximum performance for 10 Mbps Ethernet

Question: What about high-speed networking connections like fast Ethernet, ATM, and FDDI?

Answer: Benchmarking on fast Ethernet, FDDI, and ATM datalinks has been underway for some time. Some sample results include:

- 48 Mbps with a Rockwell fast Ethernet card and driver (1500 byte block size)
- 72 Mbps with a Rockwell FDDI card and driver (4K block size)
- 93 Mbps with an Interphase ATM-155 card and driver (8K block size)

These tests were performed using Open Transport/TCP 1.1 beta software, running on a Power Macintosh 9500/132, using the SpudPPC tool.

Other tests, such as the one conducted by Fore Systems on their 155 Mbps ATM cards, have shown even higher throughput. In one test, Fore was able to transmit UDP over their LAN-E stack on ATM (using 1500 byte datagrams) at over 100 Mbps.

AppleTalk performance is lower than TCP/IP performance due to the smaller DDP packet size and the ATP retry-acknowledgment algorithm. Current testing on fast Ethernet is turning in figures around 35-45 Mbps with a PowerPC native ATP test tool. This is a significant performance improvement, and further progress should be realized as application code is revised to take full advantage of Open Transport and PowerPC.

Question: Does Open Transport support the use of large datagram sizes? Does datagram size have an impact on network throughput?

Answer: Maximum allowable datagram size is dependent on both the selected datalink and the selected protocol stack. Open Transport supports the use of large datagram sizes as appropriate to the protocol and datalink in use.

Because Open Transport/AppleTalk is based on the Phase 2 architecture, datagram size for AppleTalk is limited to a maximum of 617 bytes. Open Transport/TCP supports larger datagrams; up to 1,500 bytes on Ethernet and fast Ethernet, and up to 16K on token ring; even larger block sizes can be used on FDDI and ATM.

Block size does play a role in maximum throughput; the larger the block size used, the greater the potential end-to-end throughput. Users demanding the highest network throughput may find FDDI to be a more attractive alternative than fast Ethernet because it can support larger block sizes at the same bit rate.

Open Transport 1.1.1: System Requirements FAQ (10/96)

Revised: 10/23/96
Security: Everyone

Open Transport 1.1.1: System Requirements FAQ (10/96)

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1, System Requirements FAQ (frequently asked questions).

DISCUSSION -----

Question: Which MacOS systems can take advantage of Open Transport?

Answer: Open Transport is designed to work on portable and desktop Apple Macintosh or MacOS compatible computers with a Motorola 68030 or 68040 family microprocessor, or a PowerPC 601, 603(e), or 604 microprocessor.

Apple recommends running MacOS System 7.5.3 with Open Transport, although the earlier System 7.1, 7.1.1 and 7.1.2 releases are also compatible. System 7.5.3 requires a minimum of 4 MB (680x0) or 8 MB (PowerPC) total memory; Open Transport requires a minimum of 5 MB (680x0) or 8 MB (PowerPC).

Systems running Open Transport may be able to benefit from larger than minimum memory configurations when using FDDI or ATM, as these datalinks can provide increased performance by taking advantage of larger datagrams and buffer sizes. Effective use of additional system RAM for buffers is application dependent.

Question: How do settings such as Virtual Memory and RAM disk affect Open Transport's minimum memory requirements.

Answer: Open Transport minimum memory requirements are based on total system memory including VM, less the size of any RAM disk and Disk Cache defined.

Question: How is the Memory Available as reported by the "About this Macintosh..." dialog related to Open Transport's actual memory requirements.

Answer: The "About this Macintosh..." dialog reports on both the total free memory and the largest block of contiguous free memory. In practice, the latter figure is a better indicator of whether an additional application can be launched.

If a user repeatedly opens (launches) and closes (quits) multiple applications that use Internet networking services, and if the user has set Open Transport TCP/IP preferences to load networking services only when needed, this can, over time, result in a situation where Open Transport loads into memory "between" other running applications. This "memory fragmentation", in turn, can result in a smaller value reported by "About this Macintosh..." for free contiguous memory. In extreme cases, this could limit the number of concurrent applications that a user could run.

If this situation arises, Apple recommends use of the Advanced Mode of the TCP/IP Control Panel to access the Options dialog; remove the "X" in the "Load only when needed" option. After restarting the system, Open Transport TCP/IP will load when called on by an application for the first time, but will then remain loaded. This will help avoid memory fragmentation.

Open Transport 1.1.1 includes some additional internal changes designed to reduce the frequency and significance of memory fragmentation due to the dynamic loading and unloading of TCP/IP. Depending on the pattern of use, however, it may still be desirable to disable the "load only when needed" option as discussed above

Question: Does Open Transport require more system RAM than classic networking?
If so, how much more, and why?

Answer: Open Transport provides many new features and capabilities to MacOS customers and, in general, will require more system memory (RAM) than does classic networking. However, the actual memory requirements of Open Transport are dynamic; they vary depending upon the networking services in use at a given time. This is different from classic networking, which allocates memory to networking services and keeps it allocated even after networking services are no longer in use.

Factors which contribute to differences in memory requirements include:

- Open Transport provides implementations of networking as both 680x0 and native PowerPC code; RISC code is typically larger - but also faster - than CISC programming,
- Open Transport provides "mixed-mode" applications support, making it possible for both PowerPC native and 680x0 applications to use native networking on PowerPC MacOS systems,
- Open Transport includes both the new implementations of networking and the libraries required to provide backward compatibility support for the older AppleTalk and MacTCP programming interfaces,

- Open Transport is very "VM-friendly", and has a lower memory footprint on systems with virtual memory enabled; classic network has about the same footprint regardless of the VM setting,
- Open Transport is based on the cross-platform standard STREAMS environment, which increases the total size of the implementation as compared to the proprietary classic networking implementation, and,
- To lay the groundwork for Copland's protected memory model, Open Transport allocates memory for TCP/IP applications in the system area; MacTCP allocated memory in each application.

Thus the difference in memory requirements will depend upon which configurations are measured. Some examples of base memory requirements include:

- On a PowerPC system with VM on, classic AppleTalk and MacTCP require about 350-450K; Open Transport will require about 200K to load; in other words, Open Transport base memory requirements are about 200K smaller.
- On a 680x0 system with VM off, classic AppleTalk and MacTCP require about 350-450K total system memory; Open Transport will require about 700-800K to load; in other words, Open Transport is about 350K larger.
- On a PowerPC system with VM off, classic AppleTalk and MacTCP require about 350-450K; Open Transport can require up to 1.2 MB to load, in other words, Open Transport is about 800K larger.

Question: Why does Apple recommend System 7.5.3 (System 7.5 Update 2.0)? What about System 7.5, 7.5.1, and 7.5.2?

Answer: Open Transport internal and external testing included work with all MacOS system software releases from System 7.1 forward, however, Apple's testing was most concentrated on System 7.1.x and System 7.5.3.

In moving from earlier versions of System 7.5 to System 7.5.3 a user's system will benefit from a number of updates and bug fixes that -- while not a part of Open Transport -- can improve system performance and reliability on the network for a variety of tasks, including printing and file transfers. The combination of the deeper test coverage and the important system updates that are a part of the system software update leads the Open Transport team to overall recommend System 7.5.3.

System 7.1.x users are encouraged to evaluate their needs and to consider updating to System 7.5.3.

Question: Was Open Transport 1.1 released in Japan for System 7.5.2? If so, why isn't this generally recommended?

Answer: Apple did not provide Kanji localized versions of Open Transport 1.0.8; thus, Kanji customers with PCI MacOS systems had not been able to benefit from the fixes released in OT 1.0.8. Because of the lead times required to localize

System 7.5.3 for Kanji, Apple elected to complete the localization and testing of Open Transport 1.1 independently of plans to localize System 7.5.3-J.

This decision resulted in delivery of Open Transport 1.1-J for System 7.5.2-J customers. This is a regional exception to Apple's overall recommendation to use Open Transport 1.1 in combination with System 7.5.3. When KanjiTalk 7.5.3 becomes available, Apple will recommend that all KanjiTalk 7.5.2 customers update to 7.5.3.

Question: Why didn't Open Transport 1.1 support Power Macintosh 5200/5300/6200/6300 desktop computers?

Answer: Very late in the final quality assurance cycle of Open Transport 1.1, the OT team was notified of a reproducible crash affecting some, but not all, customers with Power Macintosh or Performa 5200/5300/6200/6300 desktop computers.

Rather than delay the release of OT 1.1 and System Update 2.0 (System 7.5.3) further - which both brought many significant improvements to MacOS customers - the Performa, Open Transport, and System 7.5.3 teams working together decided that the best alternative was to disable OT 1.1 on these systems until the problem(s) were fully identified and an appropriate solution could be implemented and tested.

After additional research, this problem was isolated as a hardware issue. In response, Apple announced an Repair Extension program.

Open Transport 1.1.1 - which includes Apple Shared Library Manager 2.0.1 - (re-)enables Open Transport on these previously restricted MacOS systems. OT 1.1.1 now includes a hardware test that runs at boot time. If OT is called for on a system affected by the hardware problem, a new dialog alerts the user that classic networking is being substituted, and directs them to consult their Apple service provider for hardware service.

Question: What models are included in the Repair Extension program; that is, which models require Open Transport 1.1.1 to take advantage of Open Transport?

Answer: The models included are:

- Power Macintosh 5200/75 LC, 5300/100 LC
- Macintosh Performa 5200, 5215, 5300
- Macintosh Performa 6200, 6205, 6214, 6216, 6218, 6220, 6230, 6290, 6300

Question: What is the nature of the hardware issue that led to the original decision to disable Open Transport on these systems?

Answer: These systems might experience a system freeze upon start-up. The system freeze may be caused by known component problems on the logic board. The Repair Extension program includes replacing the logic board, as appropriate, to correct the system freezes.

Open Transport 1.1.1: TCP/IP Features FAQ (10/96)

=====

Article Created: 16 October 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article is the Open Transport 1.1.1, TCP/IP Features FAQ (frequently asked questions).

DISCUSSION -----

Question: What are some of the features of Open Transport/TCP?

Answer: With the broad cross-platform adoption of TCP/IP - and the tremendous visibility of the Internet - Apple has made a significant investment in bringing a workstation-class implementation of TCP/IP protocols to MacOS. As with Apple's earlier MacTCP, Open Transport/TCP is a full 32-bit stack.

Open Transport/TCP adds support for:

- dynamic path MTU discovery, for more efficient network use in heterogeneous network topologies;
- Dynamic Host Configuration Protocol (DHCP), for centralized IP address configuration management. DHCP is an Internet Engineering Task Force (IETF) standards-track protocol;
- IP multicast, for participation as an MBone client;
- simultaneous TCP connections limited only by installed memory and processor power, for increased functionality as a Internet or other TCP/IP network server;
- a new, more robust and standards-compliant domain name resolver (a caching stub DNR);
- support for RFC 1123 and RFC 793 TCP Urgent Pointer semantics;

- support for developer access to raw IP services, as well as TCP and UDP;
- Ethernet version 2 and IEEE 802.3 framing, for better interoperability with a wider range of TCP/IP hosts;
- implicit and explicit domain name search paths, for increased control of domain name resolution; and,
- multiple IP routers with fail-over, for increased robustness in mission critical applications.

Question: How does the new support for Dynamic Path MTU discovery work?

Answer: Open Transport/TCP sets the "don't fragment" bit in the IP datagram header on transmission unless the packet size is larger than the MTU for the network. Intermediate routers are required by current RFCs to send back an "ICMP can't fragment" error when presented with a "don't fragment" packet that cannot be forwarded without fragmentation with that MTU size. In that event, Open Transport/TCP moves to the next smaller MTU size for that path and re-sends the packet, again with the "don't fragment" bit set. This process automatically results in using the largest supported MTU size for off-subnet traffic.

Question: How does the new Open Transport/TCP domain name resolver (DNR) work?

Answer: The Open Transport/TCP DNR implements name-to-address (A), address-to-name (PTR), system CPU and OS (HINFO), and mail exchange (MX) queries. It does not implement negative caching, but depends on a local full service resolver to provide this facility. The DNR will always request recursion, but will follow references if recursion is not available.

The DNR caches name-to-address and cname-to-name mappings; this feature cannot be disabled. However, conforming to DNS practice, a reply that includes a Time to Live (TTL) of zero will result in a mapping that is used only once - it will not be cached and not be reused. (TTL values for DNS entries are configured by the administrator of the DNS server.) Unlike the older MacTCP DNR implementation, which has a cache limited to a maximum of nine entries, the Open Transport DNR is dynamically-sized with no hard limit; it expands as needed, limited only by the available system RAM.

The DNR does not cache host info (OS and CPU type information) nor does it cache Mail Exchange/Preference information. It does not save name server references after a query is resolved; further queries begin anew at the configured name servers.

Fully qualified domains names or FQDNs (those ending with a "."), and provisional FQDNs (those containing at least one "." internally but not ending with ".") are submitted for resolution without manipulation. Otherwise the name is assumed to be a partially qualified domain (PQDN).

The first - but optional - step in PQDN resolution is the use of an Implicit

Search Path. To be used, Implicit Search must first be configured using the Advanced or Administrator view by entering values in the "Implicit Search Path: Starting Domain Name" and "Ending Domain Name" fields. When so configured the DNR will attempt to change the PQDN to a FQDN for resolution by concatenating the PQDN with domain names in the ancestor hierarchy delimited by the Starting and Ending Domain Name values (that is, searching for a PQDN of joe could result in a search for joe.hardware.support.apple.com, joe.support.apple.com and joe.apple.com). Implicit searching stops when the FQDN is resolved, or when the Ending Domain Name value has been tried and fails (that is, joe.com would not be tried, assuming an Ending Domain Name value of apple.com).

If the PQDN has not yet been resolved (including the case where an Implicit Search Path was not configured), explicit Additional Search Domains are searched. For each Search Domain configured, name server(s) are contacted in the order specified in the Name Servers field. If the name is resolved in the first search domain from which an answer is returned other Search Domains will not be checked. Note that at least one Search Domain (roughly equivalent to MacTCP's Default Domain) must be explicitly configured in order to resolve any PQDNs.

If an authoritative answer that the "name-does-not-exist" is returned, the DNR immediately begins the search in the next configured Search Domain. The search continues through the configured Search Domains.

The DNR has an overall time-out of 2 minutes, after which it will abandon the search.

Question: Does Open Transport/TCP support a local HOSTS file?

Answer: Open Transport/TCP supports one or more HOSTS file, stored in the System Preferences folder, that may be used to supplement and/or customize the domain name resolver's initial cache of information. The selected file is opened and parsed when Open Transport/TCP is initialized. As with MacTCP, the supported HOSTS file features follow a subset of the Domain Name System Master File Format (RFC 1035).

Supported features include blank lines, comments (indicated by a semicolon), and data entry. Comments may begin at any location in a line; they may follow data entry on the same line. A comment extends from the semicolon to the end of the line. Data entry must follow the format:

```
<domain-name> <rr> [<comment>]
```

where <domain-name> is an absolute or Fully Qualified Domain Name, and where

```
<rr> = [<ttl>] [<class>] <type> <rdata> OR [<class>] [<ttl>] <type> <rdata>
```

The only <class> currently supported is IN (Internet Domain); <ttl>, time to live, indicates the record's configured lifetime in seconds; and <type> can be A (host address), CNAME (canonical name of an alias), or NS (name server). If <ttl> is not present the entry is assumed to have an infinite lifetime; this may also be indicated by specifying a value of minus-one (-1). \$INCLUDE and \$ORIGIN are not supported.

Open Transport/TCP is more stringent regarding the content and format of the HOSTS file than was MacTCP, which permitted violation of the FQDN requirement for . For instance, this format:

```
charlie          A          128.1.1.1
```

which was acceptable to the MacTCP DNR, is no longer permitted because of the use of domain search lists in Open Transport/TCP (charlie could potentially exist in any or all of the configured domains). To accomplish the same effect, use this format instead:

```
charlie          CNAME      myhost.mydomain.edu
myhost.mydomain.edu  A      128.1.1.1
```

This associates the local alias charlie with the fully qualified domain name myhost.mydomain.edu, and resolves it to the address 128.1.1.1. Use of local aliases is limited to CNAME entries; NS and A entries must use fully qualified domain names.

If a HOSTS file is used, every effort should be made to keep it as small as possible and to only include entries that will be accessed frequently. This reduces the total memory footprint required to cache the DNS information and minimizes the need to maintain and update the HOSTS files as system information changes over time.

In order to activate a HOSTS file, the Advanced or Administrator mode must be used to select the desired file. The text file must already exist; it could have been created with any text editor or word processor.

The HOSTS file is tied to the selected configuration. An administrator might, for example, specify different HOSTS files for use when connecting via Ethernet to the campus LAN and when dialing-in from a remote location. Thus, each OT/TCP configuration must individually specify a HOSTS file - even if the same one is to be used with each configuration.

Question: What are some of the changes to the human interface for Open Transport/TCP?

Answer: The Open Transport/TCP configuration application represents a complete overhaul of the human interface from the MacTCP software it replaces. In addition to generic new features noted elsewhere (multiple saved configurations, recommended and required settings, on-line documentation, and so on), key new features include:

- direct entry of IP addresses and subnet mask in standard "dot notation";
- explicit selection of desired configuration method, now including Manual, RARP, BootP, MacIP, and DHCP;
- support for attachment to networks using Classless InterDomain Routing (CIDR);

- support for multiple entries in the router, name server, and explicit domain search lists; and
- improved support for large AppleTalk networks when using MacIP server/gateways.

Question: Does Open Transport/TCP support MacTCP "Server" addressing?

Answer: MacTCP Server mode addressing is a combination of the Bootstrap Protocol (BootP) and Reverse Address Resolution Protocol (RARP) configuration methods. When Server mode is selected, MacTCP will use BootP to attempt to acquire an IP address. If BootP fails to provide a valid address it then tries RARP. Whichever protocol is successful is stored as a preference, and is used first on next system startup. While this "fall-back" approach adds a degree of robustness from the users point of view, it also adds a degree of unpredictability from a network administrators point of view.

Based on customer feedback, Open Transport/TCP has been designed to allow a network administrator to explicitly specify the single method they prefer to use. Thus while both RARP and BootP are individually supported, Server mode does not appear as a choice in the Open Transport/TCP configuration utility.

Question: Does Open Transport/TCP support MacTCP "Dynamic" addressing?

Answer: No. MacTCP "Dynamic" mode addressing was based on an Apple-proprietary extension to TCP/IP protocols, which applied the address negotiation and assignment rules used by the AppleTalk protocols to TCP/IP networks. This made it very easy to set-up a MacOS only TCP/IP network, but could create additional work for a network administrator in more typical heterogeneous TCP/IP networks.

The Internet community (the IETF) has since developed a multivendor standard for the dynamic assignment of IP addresses, known as Dynamic Host Configuration Protocol (DHCP). Apple has adopted the industry standard DHCP and dropped support for the earlier Apple "Dynamic" mode addressing with Open Transport/TCP.

Question: What is MacIP?

Answer: MacIP, sometimes also referred to as KIP (Kinetics Internet Protocol), is a protocol specification developed as a method for carrying TCP/IP traffic on AppleTalk only networks - originally these would have been LocalTalk networks. MacIP is today frequently used in conjunction with AppleTalk Remote Access Protocol (ARAP) to provide mobile users access to TCP/IP network services. MacIP specifies encapsulation of TCP/IP datagrams in AppleTalk packets for transmission over such connections.

Use of MacIP requires a gateway. AppleTalk encapsulated IP packets are sent to the gateway using AppleTalk protocols (DDP). The gateway strips off the encapsulation and places the IP packet on the TCP/IP LAN. When packets are

destined for a MacIP end-node, the gateway provides the needed encapsulation services.

MacIP gateway support is most frequently offered as an integrated service within a multiprotocol router. The gateway (router) attaches to both an AppleTalk and a TCP/IP network, acting as a middleman between the MacIP end-node and the appropriate TCP/IP based hosts on the LAN or WAN.

Open Transport supports MacIP end-nodes. It is selected using the TCP/IP configuration utility by choosing "AppleTalk (MacIP)" in the "Connect via:" pop-up menu. The user (or network administrator) must also specify which zone contains the desired MacIP gateway. Once selected, TCP/IP will be encapsulated in AppleTalk and will be sent to the gateway via the NIC selected using the AppleTalk configuration utility.

Question: How is MacIP support improved with Open Transport/TCP?

Answer: Open Transport/TCP offers new features in the human interface for selecting the MacIP server, including:

- AppleTalk zones are now displayed in a scrolling list in a movable window. This display is easier to view compared to MacTCP's pop-up menu, especially when there are a large number of zones in the network.
- The Zone list window now supports selection using the mouse, the arrow keys, and/or "type-select", allowing the user to more quickly select a specific zone from the list.
- There is an option to display only those AppleTalk zones containing MacIP servers. When selected, this creates a background search task which when completed filters the zone list display to show only those zones containing active MacIP servers.
- There is a short cut "Current Zone" option which causes the Mac to check the current AppleTalk zone for a MacIP server without requiring the user to select a specific zone. This can be a time-saver for the user and a potential bandwidth-saver on the network, especially when there are mobile users that connect in different locations to a enterprise-wide network for MacIP services.

Security: Everyone

At Ease 4.0: Auto-Mounting Server Volumes (10/96)

Article Created: 16 October 1996

TOPIC -----

Will At Ease 4.0 let server volumes mount automatically without having to enter a name and password? In my lab, when a user selects a Workgroup they are prompted to enter a name and password for each volume marked to automatically mount. This happens for the volume designated as the place to Save the Workgroup data and any other volumes selected to mount when the workgroup is opened.

DISCUSSION -----

Overview

Workgroup data volumes and other server volumes can automatically be mounted by At Ease 4.0. The At Ease Administrator adds the volumes to a list of "approved volumes". This is done by selecting "Access to Volumes" from the Security Menu in the At Ease Administration program. When a volume is added to the list the volume setting "At Ease Users will log in to this volume using:" defaults to "Users must enter their own name and password"

Before a volume will auto-mount (mount without prompting for a user name and password) the volume setting needs to be changed to use a predefined name and password.

Steps to configure Server Volumes

The steps to add server volumes to the list and change the volume settings are as follows:

- 1) From the At Ease Administration workstation, mount the server volume on the desktop. If it is to be a workgroup data server you must mount it using a name and password that has write privileges.

- 2) From the At Ease Administration program Security menu select "Access to Volumes".

3) Select the "Add Volume" button. This takes you to the Add Volume screen. Select the server volume and press the add button.

4) In the window of Approved Server Volumes select the newly added volume and click the Volume settings button.

5) In the settings window click the radio button stating At Ease users will log into this volume using "The user name and password for" below this options it reflects the name used to mount the volume on the desktop. This is not the default option for volumes added to the approved volumes list that is why the system forces the users to enter a name and password every time. The default is enter "Their own name and password"

With the volumes settings changed any volume designated as the workgroup location will auto-mount and not prompt the user to log in. The same is true for any other volumes marked to mount when a workgroup loads. Volumes are designated to mount via the Workgroup Login panel.

Macintosh 5200/5300/6200/6300: Using Open Transport (11/96)

Revised: 11/12/96
Security: Everyone

Macintosh 5200/5300/6200/6300: Using Open Transport (11/96)

=====

Article Created: 17 October 1996
Article Reviewed/Updated: 12 November 1996

TOPIC -----

This article contains the questions and answers about using Open Transport on Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers.

Questions Answered in this Article

=====

- 1) Why didn't Open Transport 1.1 support Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers?
- 2) What was the cause of Open Transport 1.1 not working on the Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers?
- 3) Does Open Transport 1.1.1 work on all Power Macintosh 5200, 5300, 6200, and 6300 series computers?
- 4) What specific computer models are included in the Repair Extension Program and consequently require Open Transport 1.1.1 to take advantage of Open Transport?

DISCUSSION -----

1) Question: Why didn't Open Transport 1.1 support Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers?

Answer: Very late in the final quality assurance cycle of Open Transport 1.1, the engineering team was notified of a reproducible crash affecting some, but not all, customers with Power Macintosh or Performa 5200, 5300, 6200, or 6300 series computers.

Rather than further delay the release of Open Transport 1.1 and System Update 2.0 (System 7.5.3)--which both brought many significant improvements to Mac OS

customers--the Performa, Open Transport, and System 7.5.3 teams worked together to decide that the best alternative was to disable Open Transport 1.1 on these systems until the cause was fully identified and an appropriate solution could be implemented and tested.

2) Question: What was the cause of Open Transport 1.1 not working on the Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers?

Answer: The cause was isolated as a hardware issue caused by specific, known component issues that have been identified by Apple. Symptoms of these issues include frequent system freezes, which can be traced to these hardware issues. Apple initiated the Repair Extension Program to resolve these issues that some customers were experiencing.

3) Question: Does Open Transport 1.1.1 work on all Power Macintosh 5200, 5300, 6200, and 6300 series computers?

Answer: Yes, Open Transport (OT) 1.1.1 can be used on the Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers. However, when you install OT 1.1.1 on one of these computers, a dialog box may appear indicating that a hardware issue was detected. If this alert is displayed, Open Transport cannot be installed until the Cache/ROM DIMM is replaced. The required repairs are covered under the Apple Repair Extension Program. Contact an Apple-authorized service provider to have your computer repaired. (Your computer will continue to run classic networking until it is repaired.)

4) Question: What specific computer models are included in the Repair Extension Program and consequently require Open Transport 1.1.1 to take advantage of Open Transport?

Answer: The models included are:

- * Power Macintosh 5200/75 LC, 5300/100 LC
- * Macintosh Performa 5200, 5215, 5300
- * Macintosh Performa 6200, 6205, 6214, 6216, 6218, 6220, 6230, 6290, 6300

This article was published in the Information Alley on 24 October 1996.

At Ease 4.0: Internet Prefs Not Copied Back to Server (10/96)

Revised: 10/17/96
Security: Everyone

At Ease 4.0: Internet Prefs Not Copied Back to Server (10/96)

=====

Article Created: 17 October 1996

TOPIC -----

This article describes an Internet preferences issue copying back to an At Ease 4.0 Workgroup server.

DISCUSSION -----

If the User Setting "Copy Internet User Preferences" is selected, the user preferences are copied from the server to the workstation when the user signs into any workgroup. When the user quits or restarts, the preferences are copied back to the server. However, if the user is logged into At Ease under a Finder workgroup, the Internet preferences are not copied back to the server.

The workaround is to switch to a Panels or Restricted Finder workgroup, with the At Ease menu, before quitting or restarting. The internet preferences will then be copied back to the server.

This issue will be addressed in a future release of At Ease. There is no known time frame for future At Ease releases.

System 7.5.5 Update: For Non-US Systems Read Me (10/96)

=====

Article Created: 17 October 1996

TOPIC -----

This article is the System 7.5.5 Update, For Non-US Systems ReadMe file.

DISCUSSION -----

Important information about System 7.5.5 Update for customers using non-U.S. English systems

On September 19, 1996, Apple Computer released System 7.5.5 Update for U.S. English systems. If your computer does not have the U.S. English version of System 7.5.3, you should not attempt to download and install the System 7.5.5 Update files located in this directory. As stated in the press update and Q&A document, Apple expects localized versions of System 7.5.5 Update to be available in many countries within 90 days after the U.S. introduction. Please contact your local Apple support center for local availability.

System 7.5.5 Update Tips Read Me (10/96)

Article Created: 17 October 1996

TOPIC -----

This article is the System 7.5.5 Update Tips ReadMe file.

DISCUSSION -----

System 7.5.5 Update: Tips for Installation

This document gives you late-breaking news about installing System 7.5.5 Update. Follow the instructions here to make installing System 7.5.5 Update as smooth as possible.

Installation when using Energy Saver version 1.2 and earlier. If you have Energy Saver version 1.2 or earlier on your system, you may experience problems installing System 7.5.5 Update. To determine the version of your Energy Saver, follow these steps:

- 1) Make sure you are in the Finder by choosing Finder from the Application menu at the top right of your screen.
- 2) Open your hard disk.
- 3) Open the System Folder.
- 4) Open the Control Panels folder.
- 5) Look for the Energy Saver control panel. If you don't see it, close the Control Panels window, open the Control Panels (disabled) folder, and look for the Energy Saver control panel. If you don't see the control panel in this folder either, you can install System 7.5.5 Update now.
- 6) Click the Energy Saver icon once to select it and choose Get Info from the File menu.
- 7) Look at the section called Version in the middle of the Info window.

If the version number is 2.0 or higher, you can install System 7.5.5 Update now. If the version number is 1.2 or lower, follow these steps:

- 1) Drag the Energy Saver control panel out of your Control Panels folder

to your desktop.

- 2) Install System 7.5.5 Update.
- 3) Restart your computer.
- 4) Drag the Energy Saver control panel back to your Control Panels folder.
- 5) Restart your computer.

System 7.5.5 Update does not install QuickTime 2.5. System 7.5.5 Update is ready to work with QuickTime 2.5. However, the update does not install QuickTime 2.5. You must install QuickTime 2.5 separately. You can download QuickTime 2.5 software from Apple Computer's web site at <http://www.quicktime.apple.com>.

System 7.5.5 Update should not be installed on Apple Workgroup Servers. System 7.5.5 Update is not currently approved for installation on Apple Workgroup Servers.

System 7.5.5 Update should only be installed on U.S. English systems. System 7.5.5 Update will incorrectly install over systems based on languages other than U.S. English. You should not attempt to do this, as it may disable your system. Apple expects localized versions of System 7.5.5 Update to be available in many countries within 90 days after the U.S. introduction. Please contact your local Apple support center for local availability.

At Ease: Update History & How to Get Latest Version (10/96)

Revised: 10/18/96
Security: Everyone

At Ease: Update History & How to Get Latest Version (10/96)

=====

Article Created: 17 October 1996

TOPIC -----

With all the recent At Ease updates made available, which should I apply to my At Ease environment?

DISCUSSION -----

At Ease 3.0 was released in summer of 1995 as both a workgroups and basic product. A few bugs were reported by schools using the 3.0 workgroups product, and 3.0.1 was released late in 1995 to both fix those bugs and to increase performance. There was no concurrent release of the basic product to version 3.0.1 since the majority and more serious of the problems were network or workgroups related.

In early 1996, a security bug that existed in workgroups version 3.0 and 3.0.1 was found to cause a problem on certain IDE disk drives that required an immediate fix. Additionally, an incompatibility with Open Transport (shipped in System 7.5.3) caused problems with At Ease 3.0.x on some newer computers. Version 3.0.2 workgroups was created to fix these problems.

At Ease 3.0.3 is primarily a recompile of the current At Ease workgroups 3.0.2 sources, along with a small change to the basic admin application, At Ease Setup.

The At Ease 3 CDROM Prefs Patch fixes a problem discovered shortly after version 3.0.3 was released.

The following table summarizes how to get to the best update level.

Begin_Table

What you have now	What to install to get the fixes for that version
-----	-----

At Ease (Basic) 2.0.x	At Ease Update 1.0
At Ease (WG) 2.0.x	At Ease 2.0.3 Update + At Ease Update 1.0
At Ease (Basic) 3.0	At Ease 3.0.3 Updater + At Ease 3 CDROM Prefs Patch
-- or --	At Ease Update 1.0 + At Ease 3 CDROM Prefs Patch
At Ease (WG) 3.0.x	At Ease 3.0.3 Updater + At Ease 3 CDROM Prefs Patch
At Ease 4.0	No updates are currently available for At Ease 4.0
End_Table	

The At Ease Update software mentioned above can be found on Apple Computer's software update locations. These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

System 7.5.5: Won't Work on Some Mac OS Compatibles (10/96)

Revised: 10/18/96
Security: Everyone

System 7.5.5: Won't Work on Some Mac OS Compatibles (10/96)

=====

Article Created: 18 October 1996

TOPIC -----

I have read that System 7.5.5 will not work on some Mac OS compatible computers.
Is this correct?

DISCUSSION -----

This is correct. On some Mac OS compatible computers, System 7.5.5 will not work. You should use the version of the Mac OS installed on your Mac OS Compatible computer, or contact the manufacturer of your computer to find out what version of the Mac OS you can use.

StyleWriter 1200: Use Latest Driver to Improve Speed (10/96)

Revised: 10/18/96
Security: Everyone

StyleWriter 1200: Use Latest Driver to Improve Speed (10/96)

=====

Article Created: 18 October 1996

TOPIC -----

I have a StyleWriter 1200 and a StyleWriter II printer. The StyleWriter 1200 takes longer to print the same document than the StyleWriter II does.

DISCUSSION -----

You need to use the StyleWriter 1500 printer driver with the StyleWriter 1200 printer. When you upgrade to the StyleWriter 1500 software, you will notice an increase in speed using the StyleWriter 1200 printer.

All customers who own a StyleWriter 1200 should upgrade to the StyleWriter 1500 printer software v2.2 or higher, since it is the most recent software for the StyleWriter 1200 printer.

Read Me for International Keyboards (10/96)

Revised: 10/21/96
Security: Everyone

Read Me for International Keyboards (10/96)

Article Created: 21 October 1996

TOPIC -----

This article is the ReadMe for International Keyboards file.

DISCUSSION -----

IMPORTANT KEYBOARD INFORMATION

This document provides late-breaking information that could not be included in the PC Compatibility Card User's Manual or in the DOS Compatibility Software Update User's Manual.

INSTALLING APPLE KEYBOARD FILES ON WINDOWS 3.1

1. Start Windows.
2. Insert the "International keyboard files" floppy in the drive.
3. Open the International control panel.
4. Select the desired language in the Keyboard layout area; then click OK.
5. In the Install Driver dialog box, click Browse.
6. Select the appropriate drive containing the keyboard file of the desired language. (Keyboard files have .dll file name extensions). The path is <floppy drive>\KEYBOARD\WIN31\<language>\<filename>.dll
7. Select the desired file, then close the control panel and restart Windows.

INSTALLING APPLE KEYBOARD FILES ON WINDOWS 95

1. Start Windows 95 and click the Start button.
2. Verify the keyboard file (file names have .kbd extension) for the desired language does not exist the System directory (under the Windows directory). Otherwise, delete it by dragging the file in the Recycle Bin and deleting.

3. Click on Settings; then select Control Panel.
4. Double click on the Keyboard icon.
5. Click on the Language tab.
6. If the language you desire to install already appears in the language list, select it and click on the Remove button.
7. Click on the Add button.
8. In the list that appears, select the desired language and click OK.
9. Click the name of the language whose keyboard layout you want to use; then click Set as Default.
10. On the bottom of the window, click on the Apply button.
11. At this point, a small dialog box for locating the keyboard file will appear if Windows is searching for the keyboard file for the first time.
12. Insert the "International keyboard files" floppy in the drive.
13. Click on the Browse button; then select the floppy drive.
14. In the Folders window, locate the folder containing the desired file, then click OK. The path is: <floppy drive>\KEYBOARD\WIN95\<language>
15. Make sure to switch the language in the keyboard bar on bottom right hand (this bar is where the current time appears).
16. Restart any applications that were running during the keyboard installation to active recently selected keyboard file.

ADDITIONAL INFORMATION

The keyboard drivers included on the "International keyboard files" floppy correspond to the keyboard layout of the Apple Design Keyboard and the Apple ISO Extended Keyboard II. Some of the drivers are updates to the ones included on the PC Utility CD; users should install keyboard files from the floppy rather than from the CD.

Keyboard drivers are included for Window 3.1 and Windows 95 in support the following layouts: Belgian, British, Danish, Dutch, Finnish, French-Canadian, French, German, Italian, Norwegian, Spanish, Swedish, Swiss-French

In some drivers, the numeric separator in the numeric keypad does not match the separator of the Apple Design Keyboard and the Apple ISO Extended Keyboard II. If that is the case with your desired keyboard driver, you should enter the separator from the main portion of the keyboard.

Monitors & Sound CP: Sound Out Doesn't Adjust RCA Volume (10/96)

Revised: 10/21/96
Security: Everyone

Monitors & Sound CP: Sound Out Doesn't Adjust RCA Volume (10/96)

=====

Article Created: 21 October 1996

TOPIC -----

On my Power Macintosh 7500 computer I am trying to adjust the volume of the RCA Sound Out connectors. I have tried to adjust the volume using the Sound Out Level and Computer Speaker Volume in the Monitors & Sound control panel. But neither of these adjust the volume of the RCA Sound Out connectors.

DISCUSSION -----

What you are describing is normal for the Sound Out connector. The RCA Sound out plugs in the back of several Power Macintosh models including the Power Macintosh 7500, 7600 and 8500 give a continuous "line-out" level used in most stereo equipment. There is no way to adjust the sound level of the RCA sound out level. You can mute the sound of the RCA sound out connectors by selecting Mute in the Computer Speaker Volume level in the Monitors & Sound control panel.

The purpose of the Sound Out Level volume control in the Monitors & Sound Control Panel is to adjust the volume of the headphone connector. With the two controls (Sound Out Level and Computer Speaker Volume), you can adjust the Internal computer speaker and the headphone connector independently of each other.

NOTE:

Monitors & Sound control panel automatically mutes and un-mutes the Computer Speaker Volume when you plug a headphone plug into the headphone connector. You can go into the Control Panel and un-mute the control panel manually, but it defaults to mute when the computer is restarted.

Power Macintosh: Memory FAQ (10/96)

Revised: 10/22/96
Security: Everyone

Power Macintosh: Memory FAQ (10/96)

Article Created: 22 October 1996

TOPIC -----

This article contains the answers to frequently asked questions about memory expansion in Power Macintosh computers.

Note: The majority of this information is taken directly from the Developer Technical Support TECHNOTE: SIMMs to DIMMs: Making Sense Out of Memory Expansion for the Power Macintosh.

Questions Answered in this FAQ

1) Why has Apple transitioned memory expansion from 72-pin SIMMs to 168-pin DIMMs for Power Macintosh computers?

2) Why do SIMMs need to be installed in complementary pairs, when DIMMs can be added on a per module basis?

3) How does the PowerPC address memory?

4) What is memory interleaving and what advantage does it provide?

5) How is memory interleaving enabled?

6) What speed SIMMs and DIMMs are required for Power Macintosh computers?

7) Can faster speed memory modules be used in Power Macintosh computers and will they increase system performance, for example, 60 nsec instead of 70 nsec modules for a performance increase of 10 - 15 percent?

8) Can different speed memory modules be intermixed, for example, 60 and 70 nsec modules in a Power Macintosh computer that is specified at 70 nsec?

9) What does refresh rate or count refer to (such as, 1K, 2K, or 4K)?

- 10) How do Power Macintosh computers provide continuous refreshing?
- 11) How are different sized SIMMs and DIMMs -- 16 Mbytes, 32 Mbytes, etc. -- designed with different types of DRAM devices, such as 4M x 4, 2M x 8, and 1M x 16 parts?
- 12) Do Macintosh computers support composite memory modules?
- 13) Can memory modules with different refresh rates or counts be intermixed?
- 14) What is EDO memory and do Macintosh computers support it?
- 15) What is parity memory and do Power Macintosh computers support it?
- 16) What is ECC memory and do Macintosh computers support it?

DISCUSSION -----

1) Question: Why has Apple transitioned memory expansion from 72-pin SIMMs to 168-pin DIMMs for Power Macintosh computers?

Answer: New Macintosh computers incorporating DIMMs provide a number of key advantages for an ever-increasing RAM footprint and memory-hungry applications (such as in multimedia development):

- * a wider 64 bit data path
- * higher memory capacity
- * greater flexibility because systems do not require DIMMs to be installed in complementary pairs.

2) Question: Why do SIMMs need to be installed in complementary pairs, when DIMMs can be added on a per module basis?

Answer: The reason is because of differences in the "width" of the data bus. On SIMMs, the data bus is 32 bits wide while the data bus on DIMMs is 64 bits wide.

To span the PowerPC 64 bit data bus, SIMMs need to be installed in complimentary pairs . DIMMs, with their 64 bit data bus, can be installed individually in second generation Power Macintosh computers.

The only exception to this are some entry-level Power Macintosh computers, such as the Power Macintosh 5200/75 LC, which incorporate a PowerPC 603 processor configured with a 32 bit bus. In such computers, SIMMs are used for memory expansion and not installed in identical pairs.

3) Question: How does the PowerPC address memory?

Answer: PowerPC microprocessors are 32 bit processors that have 4 Gbytes of address space. This means that the processor instructions are encoded in 32 bits, and that they can address or access 4 Gbytes of data. Although the PowerPC has 4G of address space, only a portion of the 4G is allocated for main memory

(DRAM memory). For example, the total RAM expansion on entry-level Macs can be as much as 136 Mbytes, while RAM expansion on Power Mac 9500 can be as much as 1.5G. The remaining portion of the address space is allocated for system ROM, PCI cards, system control, etc.

Data is transferred between the PowerPC and main memory via the 64 bit data bus by memory reads or memory writes.

There are two types of memory transactions: single- and four-beat transfers. A single-beat memory transaction reads or writes between one to 8 bytes of data. (Equating 8 bytes to 64 bits and noting that the data bus is 64 bits wide, the PowerPC can read or write eight bytes in a single memory operation.) A four-beat memory transaction reads or writes a cache block of 32 bytes to or from memory. Each of the four beats encompasses 8 bytes.

What's important to understand is that the memory bus is 64 bits wide and up to 8 bytes can be transferred in a single memory operation.

4) Question: What is memory interleaving and what advantage does it provide?

Answer: Even though the system data bus is 64 bits wide, the memory controller in Power Macintosh 7500, 7600, 8500, and 9500 computers can support 128 bit data read and write operations by interleaving data between corresponding DIMMS.

Memory interleaving provides higher bandwidth (MBytes per second) between the PowerPC microprocessor and main memory. It also provides a significant performance boost, increasing the execution speed of memory-intensive programs. How much faster depends on the program's software architecture and whether an L2 cache is present.

5) Question: How is memory interleaving enabled?

Memory interleaving is a function of the memory controller used in Power Macintosh 7500, 7600, 8500, and 9500 computers. Memory interleaving is enabled by the power-up software when it detects two DIMMs in corresponding expansion slots (such as, A1 and B1, A2 and B2, and so on) that are the same density, have the same memory bank configuration, and have the same DRAM addressing modes.

6) Question: What speed SIMMs and DIMMs are required for Power Macintosh computers?

Answer: The access time of DRAMs used to expand memory on most Power Macintosh computers are 80 nsec, 70 nsec, and faster, as we move into the future. Always be sure to check memory expansion specifications for your particular computer before making a purchase.

7) Question: Can faster speed memory modules be used in Power Macintosh computers and will they increase system performance, for example, 60 nsec instead of 70 nsec modules for a performance increase of 10 - 15 percent?

Answer: Faster speed memory modules will most likely work fine in Power Macintosh computers, for example, 60 nsec instead of 70 nsec modules. This will not increase CPU performance, however. The PowerPC processor will not access memory any faster with faster memory module speed, since Power Macintosh computers do not use memory module speed sense lines.

Note: Apple recommends that for memory expansion that you stay with the speed specified for the computer. Although faster devices most likely will work, keep in mind that these are untested configurations.

8) Question: Can different speed memory modules be intermixed, for example, 60 and 70 nsec modules in a Power Macintosh computer that is specified at 70 nsec?

Answer: As long as memory modules speeds are equal to or less than the Power Macintosh-specified memory speed, installing different speed modules should have no impact on the Power Macintosh computer's functionality.

9) Question: What does refresh rate or count refer to (such as, 1K, 2K, or 4K)?

Answer: The term "4K refresh," for example, refers to the number of refresh cycles required to refresh all sections of the memory array and is determined by the number of row addresses. (12 addresses will address 4096, or 4K, locations. Similarly, 11 addresses will address 2048, or 2K, locations.)

Data stored in DRAM devices is volatile. To maintain data integrity, DRAM requires a power source and continuous refreshing.

DRAMs are specified at different refresh rates that may or may not be compatible with a particular PC model. Macintosh computers are compatible with widely available DRAM devices.

For example, below are three common 16 MBit DRAM devices used to construct SIMMs or DIMMs.

Begin_Table

Organization	Refresh - Addressing	Refresh - Addressing
=====	=====	=====
4M x 4	4K - 12/10	2K - 11/11
2M x 8	4K - 12/9	2K - 11/10
1M x16	4K - 12/8	1K - 10/10

End_Table

This information demonstrates that 4M x 4 devices come in 4K and 2K refresh rates, with 12/10 and 11/11 addressing, respectively. Addressing notation refers to a matrix array organization where 4K refresh devices (12/10) have 12 row addresses and 10 column addresses. Likewise, 2K refresh devices (11/11) have 11 row addresses and 11 column addresses. Both modes (12/10 & 11/11) have 22 address lines (number of column plus row lines) which is required for an address

space of 4,194,304 (or 4M) locations, each of which contains a 4-bit word.

Note: 4M x 4 refers to a DRAM device with an address space of 4M locations, each containing a data word 4 bits wide. (4M x 4 equals 16 Mbits; DRAM devices are usually referred to by size [total number of bits].)

10) Question: How do Power Macintosh computers provide continuous refreshing?

Answer: The power source and refreshing are provided as long as the computer is powered on. The Memory Controller in Apple Macintosh and Power Macintosh computers generate a CAS (Columb Address Strobe) before RAS (Row Address Strobe) refresh cycle every 15.6 msec. DRAM devices contain an address refresh counter which is triggered by a CAS before RAS memory cycle.

A 16 MBit (11/11) device with an 11 row address - referred to as a 2K refresh part - requires all row address combinations (2048) to be accessed every 32 msec. A 4K refresh device (12/10) requires 64 msec to refresh all row addresses. DRAM row addresses are refreshed by the Refresh Address Counter, which is triggered by a CAS before RAS refresh cycle.

The importance, therefore, lies less in whether or not a Macintosh CPU supports 1K, 2K, and/or 4K refresh DRAM parts than whether the Macintosh Memory Controller and DRAM devices have compatible addressing schemes, and whether the DRAM devices are compatible with CAS before RAS refresh cycles every 15.6 use.

11) Question: How are different sized SIMMs and DIMMs -- 16 Mbytes, 32 Mbytes, etc. -- designed with different types of DRAM devices, such as 4M x 4, 2M x 8, and 1M x 16 parts?

Answer: Consider three different DIMM modules designed using 4M x 4, 2M x 8, and 1M x 16 devices: DIMM #1, DIMM #2, and DIMM #3.

Remembering that DIMMs and SIMMs have a 64 bit and 32 bit wide data bus, respectively, the following examples can be applied to SIMM modules by using half the number of devices to span 32 bits.

DIMM #1
=====

This is a 32 Mbyte DIMM using 4M x 4 devices in a single bank design. SIMM and DIMM memory modules accommodate one or two memory banks. This DIMM has the following characteristics:

- * a single bank implementation;
- * the memory is laid out to span 64 bits, so 4M x 4 devices require 16 parts per bank;
- * the addressing is common across all DRAM on the module and is multiplexed via RAS and CAS singles, as noted by Control;
- * the module has a density of 4M x 64 (address space of 4M by 64 bits wide), or 32 Mbytes.

Note: Macintosh computers will size and determine the addressing mode (e.g., 4M x 4, 2M x 8, etc.) of memory modules at system startup.

DIMM #2

=====

This is a 16 Mbyte DIMM using 2M x 8 devices in a single bank. You may be asking yourself: if both 4M x 4 and 2M x 8 parts are considered 16 Mbit devices and both examples are single bank designs, why is DIMM #1's design 32 Mbytes and DIMM #2's design 16 Mbytes?

Since the data path of a 2M x 8 device is 8 bits wide, rather than 4 bits wide -- as for 4M x 4 parts -- it requires half the number of devices to span across 64 bits.

Note: DIMM #2 uses 8 devices and DIMM #1 uses 16. DIMM #2 thus has a module density of 2M x 64, or 16, Mbytes.

DIMM #3

=====

This is a 16 Mbyte DIMM using 1M x 16 devices in a two bank design. What's important to note for this particular design is the following:

- * There are two separate memory banks;
- * each bank contains four devices - spanning 64 bits
- * both banks have common address and data buses

In this example, there are two 1M x 64 banks, resulting in a module density of 2M x 64 or 16 Mbytes.

12) Question: Do Macintosh computers support composite memory modules?

Answer: No. Apple defines a composite memory module as one that loads the data bus with more than one DRAM input load per bank. Both SIMM and DIMM can accommodate a maximum of two memory banks per module.

13) Can memory modules with different refresh rates or counts be intermixed?

For first generation Power Macintosh computers that require SIMMs to be installed in pairs, the two SIMMs within a pair need to be identical. Other pairs can have different supported refresh rates.

DIMMs with different supported refresh rates can be intermixed. But if it's intended to enable memory interleaving, DIMMs with different refresh rates may or may not have DRAM devices with same addressing modes.

Note: DRAM devices require the same addressing mode to enable interleaving.

14) Question: What is EDO memory and do Macintosh computers support it?

EDO (Extended Data Out -- sometimes called hyperpage) memory are DRAM devices that improve access timing by extending its data out timing while allowing the

memory controller to address the next column address. Although EDO devices will improve timing efficiency to main memory by approximately 10%, it does not necessarily mean programs will execute 10% faster. Because much of the time the CPU fetches instructions and data from cached memory, for example, L1 cache within the PowerPC microprocessor and or L2 cache on the mother board.

EDO DRAM is a superset of conventional (also called Fast Page Mode) DRAM. This means that an EDO DRAM can be used in place of a Fast Page Mode DRAM, although unless the memory controller is designed to utilize the faster EDO timing, the memory performance will be the same as Fast Page Mode.

Power Macintosh computers do not yet support the extended data out timing that EDO DRAM devices can provide. In the future, Power Macintosh computers will support the extended data out timing, taking full advantage of EDO DRAM devices.

Macintosh Computers that CAN use EDO memory

=====

* Although you will not derive any performance benefits by using EDO DIMMs, you can use them in Power Macintosh 5400, 7500, 7600, 8500, and 9500 and Macintosh Performa 6400 series computers.

Macintosh Computers that CANNOT use EDO memory

=====

* You cannot use EDO DIMMs in the Power Macintosh 7200 computer. Using EDO memory in the Power Macintosh 7200 computer can cause damage to the logic board and to the DIMMs. Because of this, Apple does not support using EDO memory in the Power Macintosh 7200 computer. Any damage incurred from using EDO memory in the Power Macintosh 7200 computer may not be covered under Apple Computer's limited hardware warranty.

* Also, the Power Macintosh 6100, 7100, and 8100 series computer do not support EDO memory.

15) Question: What is parity memory and do Power Macintosh computers support it?

Answer: If a computer is designed for parity RAM, the parity bit allows the memory controller to check for DRAM errors in the form of a parity error. A parity error cannot correct system errors, but the system can be designed to alert the user that a memory error has occurred.

Apple's newly-introduced Network Server 500 and 700 products are the only computers that support parity memory; all other Power Macintosh Desktop, Tower, and PowerBook computers do not. Parity memory modules add one parity bit to each byte. Thus, a 64 bit DIMM -- eight bytes -- expands from 64 bits to 72 bits wide.

16) Question: What is ECC memory and do Macintosh computers support it?

Answer: Macintosh computers do not support ECC memory. ECC (Error Correction

Coding) memory has additional check bits for each byte. This entails the memory controller calculating and writing error control check bits on each memory write operation, and recalculating and comparing the check bits on memory read operations, and then if necessary correcting the bad bits. As opposed to parity, this can automatically correct single bit RAM errors.

- 11) How are different sized SIMMs and DIMMs -- 16 Mbytes, 32 Mbytes, etc. -- designed with different types of DRAM devices, such as 4M x 4, 2M x 8, and 1M x 16 parts?
- 12) Do Macintosh computers support composite memory modules?
- 13) Can memory modules with different refresh rates or counts be intermixed?
- 14) What is EDO memory and do Macintosh computers support it?
- 15) What is parity memory and do Power Macintosh computers support it?
- 16) What is ECC memory and do Macintosh computers support it?
- 17) My manual suggests that when upgrading my cache, I use Apple-branded cache. I would like to purchase a 512k cache module, but it does not appear that Apple sells this size. What size should I purchase?

DISCUSSION -----

1) Question: Why has Apple transitioned memory expansion from 72-pin SIMMs to 168-pin DIMMs for Power Macintosh computers?

Answer: New Macintosh computers incorporating DIMMs provide a number of key advantages for an ever-increasing RAM footprint and memory-hungry applications (such as in multimedia development):

- * a wider 64 bit data path
- * higher memory capacity
- * greater flexibility because systems do not require DIMMs to be installed in complementary pairs.

2) Question: Why do SIMMs need to be installed in complementary pairs, when DIMMs can be added on a per module basis?

Answer: The reason is because of differences in the "width" of the data bus. On SIMMs, the data bus is 32 bits wide while the data bus on DIMMs is 64 bits wide.

To span the PowerPC 64 bit data bus, SIMMs need to be installed in complimentary pairs . DIMMs, with their 64 bit data bus, can be installed individually in second generation Power Macintosh computers.

The only exception to this are some entry-level Power Macintosh computers, such as the Power Macintosh 5200/75 LC, which incorporate a PowerPC 603 processor configured with a 32 bit bus. In such computers, SIMMs are used for memory expansion and not installed in identical pairs.

3) Question: How does the PowerPC address memory?

Answer: PowerPC microprocessors are 32 bit processors that have 4 Gbytes of address space. This means that the processor instructions are encoded in 32 bits, and that they can address or access 4 Gbytes of data. Although the PowerPC has 4G of address space, only a portion of the 4G is allocated for main memory (DRAM memory). For example, the total RAM expansion on entry-level Macs can be as much as 136 Mbytes, while RAM expansion on Power Mac 9500 can be as much as 1.5G. The remaining portion of the address space is allocated for system ROM, PCI cards, system control, etc.

Data is transferred between the PowerPC and main memory via the 64 bit data bus by memory reads or memory writes.

There are two types of memory transactions: single- and four-beat transfers. A single-beat memory transaction reads or writes between one to 8 bytes of data. (Equating 8 bytes to 64 bits and noting that the data bus is 64 bits wide, the PowerPC can read or write eight bytes in a single memory operation.) A four-beat memory transaction reads or writes a cache block of 32 bytes to or from memory. Each of the four beats encompasses 8 bytes.

What's important to understand is that the memory bus is 64 bits wide and up to 8 bytes can be transferred in a single memory operation.

4) Question: What is memory interleaving and what advantage does it provide?

Answer: Even though the system data bus is 64 bits wide, the memory controller in Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 computers can support 128 bit data read and write operations by interleaving data between corresponding DIMMS.

Memory interleaving provides higher bandwidth (MBytes per second) between the PowerPC microprocessor and main memory. It also provides a significant performance boost, increasing the execution speed of memory-intensive programs. How much faster depends on the program's software architecture and whether an L2 cache is present.

5) Question: How is memory interleaving enabled?

Memory interleaving is a function of the memory controller used in Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 computers. Memory interleaving is enabled by the power-up software when it detects two DIMMs in corresponding expansion slots (such as, A1 and B1, A2 and B2, and so on) that are the same density, have the same memory bank configuration, and have the same DRAM addressing modes.

6) Question: What speed SIMMs and DIMMs are required for Power Macintosh computers?

Answer: The access time of DRAMs used to expand memory on most Power Macintosh computers are 80 nsec, 70 nsec, and faster, as we move into the future. Always

be sure to check memory expansion specifications for your particular computer before making a purchase.

7) Question: Can faster speed memory modules be used in Power Macintosh computers and will they increase system performance, for example, 60 nsec instead of 70 nsec modules for a performance increase of 10 - 15 percent?

Answer: Faster speed memory modules will most likely work fine in Power Macintosh computers, for example, 60 nsec instead of 70 nsec modules. This will not increase CPU performance, however. The PowerPC processor will not access memory any faster with faster memory module speed, since Power Macintosh computers do not use memory module speed sense lines.

Note: Apple recommends that for memory expansion that you stay with the speed specified for the computer. Although faster devices most likely will work, keep in mind that these are untested configurations.

8) Question: Can different speed memory modules be intermixed, for example, 60 and 70 nsec modules in a Power Macintosh computer that is specified at 70 nsec?

Answer: As long as memory modules speeds are equal to or less than the Power Macintosh-specified memory speed, installing different speed modules should have no impact on the Power Macintosh computer's functionality.

9) Question: What does refresh rate or count refer to (such as, 1K, 2K, or 4K)?

Answer: The term "4K refresh," for example, refers to the number of refresh cycles required to refresh all sections of the memory array and is determined by the number of row addresses. (12 addresses will address 4096, or 4K, locations. Similarly, 11 addresses will address 2048, or 2K, locations.)

Data stored in DRAM devices is volatile. To maintain data integrity, DRAM requires a power source and continuous refreshing.

DRAMs are specified at different refresh rates that may or may not be compatible with a particular PC model. Macintosh computers are compatible with widely available DRAM devices.

For example, below are three common 16 MBit DRAM devices used to construct SIMMs or DIMMs.

Begin_Table

Organization	Refresh - Addressing	Refresh - Addressing
=====	=====	=====
4M x 4	4K - 12/10	2K - 11/11
2M x 8	4K - 12/9	2K - 11/10
1M x16	4K - 12/8	1K - 10/10

End_Table

This information demonstrates that 4M x 4 devices come in 4K and 2K refresh rates, with 12/10 and 11/11 addressing, respectively. Addressing notation refers to a matrix array organization where 4K refresh devices (12/10) have 12 row addresses and 10 column addresses. Likewise, 2K refresh devices (11/11) have 11 row addresses and 11 column addresses. Both modes (12/10 & 11/11) have 22 address lines (number of column plus row lines) which is required for an address space of 4,194,304 (or 4M) locations, each of which contains a 4-bit word.

Note: 4M x 4 refers to a DRAM device with an address space of 4M locations, each containing a data word 4 bits wide. (4M x 4 equals 16 Mbits; DRAM devices are usually referred to by size [total number of bits].)

10) Question: How do Power Macintosh computers provide continuous refreshing?

Answer: The power source and refreshing are provided as long as the computer is powered on. The Memory Controller in Apple Macintosh and Power Macintosh computers generate a CAS (Columb Address Strobe) before RAS (Row Address Strobe) refresh cycle every 15.6 msec. DRAM devices contain an address refresh counter which is triggered by a CAS before RAS memory cycle.

A 16 MBit (11/11) device with an 11 row address - referred to as a 2K refresh part - requires all row address combinations (2048) to be accessed every 32 msec. A 4K refresh device (12/10) requires 64 msec to refresh all row addresses. DRAM row addresses are refreshed by the Refresh Address Counter, which is triggered by a CAS before RAS refresh cycle.

The importance, therefore, lies less in whether or not a Macintosh CPU supports 1K, 2K, and/or 4K refresh DRAM parts than whether the Macintosh Memory Controller and DRAM devices have compatible addressing schemes, and whether the DRAM devices are compatible with CAS before RAS refresh cycles every 15.6 use.

11) Question: How are different sized SIMMs and DIMMs -- 16 Mbytes, 32 Mbytes, etc. -- designed with different types of DRAM devices, such as 4M x 4, 2M x 8, and 1M x 16 parts?

Answer: Consider three different DIMM modules designed using 4M x 4, 2M x 8, and 1M x 16 devices: DIMM #1, DIMM #2, and DIMM #3.

Remembering that DIMMs and SIMMs have a 64 bit and 32 bit wide data bus, respectively, the following examples can be applied to SIMM modules by using half the number of devices to span 32 bits.

DIMM #1

=====

This is a 32 Mbyte DIMM using 4M x 4 devices in a single bank design. SIMM and DIMM memory modules accommodate one or two memory banks. This DIMM has the following characteristics:

- * a single bank implementation;
- * the memory is laid out to span 64 bits, so 4M x 4 devices require 16 parts per bank;

..TIL20575-Power_Macintosh-Memory_FAQ_3-97_(TA36147).pdf

- * the addressing is common across all DRAM on the module and is multiplexed via RAS and CAS singles, as noted by Control;
- * the module has a density of 4M x 64 (address space of 4M by 64 bits wide), or 32 Mbytes.

Note: Macintosh computers will size and determine the addressing mode (e.g., 4M x 4, 2M x 8, etc.) of memory modules at system startup.

DIMM #2

=====

This is a 16 Mbyte DIMM using 2M x 8 devices in a single bank. You may be asking yourself: if both 4M x 4 and 2M x 8 parts are considered 16 Mbit devices and both examples are single bank designs, why is DIMM #1's design 32 Mbytes and DIMM #2's design 16 Mbytes?

Since the data path of a 2M x 8 device is 8 bits wide, rather than 4 bits wide -- as for 4M x 4 parts -- it requires half the number of devices to span across 64 bits.

Note: DIMM #2 uses 8 devices and DIMM #1 uses 16. DIMM #2 thus has a module density of 2M x 64, or 16, Mbytes.

DIMM #3

=====

This is a 16 Mbyte DIMM using 1M x 16 devices in a two bank design. What's important to note for this particular design is the following:

- * There are two separate memory banks;
- * each bank contains four devices - spanning 64 bits
- * both banks have common address and data buses

In this example, there are two 1M x 64 banks, resulting in a module density of 2M x 64 or 16 Mbytes.

12) Question: Do Macintosh computers support composite memory modules?

Answer: No. Apple defines a composite memory module as one that loads the data bus with more than one DRAM input load per bank. Both SIMM and DIMM can accommodate a maximum of two memory banks per module.

13) Can memory modules with different refresh rates or counts be intermixed?

For first generation Power Macintosh computers that require SIMMs to be installed in pairs, the two SIMMs within a pair need to be identical. Other pairs can have different supported refresh rates.

DIMMs with different supported refresh rates can be intermixed. But if it's intended to enable memory interleaving, DIMMs with different refresh rates may or may not have DRAM devices with same addressing modes.

Note: DRAM devices require the same addressing mode to enable interleaving.

14) Question: What is EDO memory and do Macintosh computers support it?

EDO (Extended Data Out -- sometimes called hyperpage) memory are DRAM devices that improve access timing by extending its data out timing while allowing the memory controller to address the next column address. Although EDO devices will improve timing efficiency to main memory by approximately 10%, it does not necessarily mean programs will execute 10% faster. Because much of the time the CPU fetches instructions and data from cached memory, for example, L1 cache within the PowerPC microprocessor and or L2 cache on the mother board.

EDO DRAM is a superset of conventional (also called Fast Page Mode) DRAM. This means that an EDO DRAM can be used in place of a Fast Page Mode DRAM, although unless the memory controller is designed to utilize the faster EDO timing, the memory performance will be the same as Fast Page Mode.

There are three categories of Power Macintosh computers based on their level of EDO memory support. In some Power Macintosh computers, you can use EDO memory and get some potential performance boosts. In others, you can use EDO memory even though you will not derive any benefits from doing so. Finally, there are some Power Macintosh computers in which Apple does not recommend using EDO memory because doing so may damage your computer.

Power Macintosh Computers that Support EDO Memory

The following Power Macintosh computers fully support EDO memory and may experience increased performance:

- Power Macintosh 4400 series
- Power Macintosh 5500 series
- Power Macintosh 6500 series
- Macintosh Performa 6400/200 with internal Zip drive

All memory installed must be EDO to take advantage of the benefits. If you mix FPM and EDO RAM, the EDO modules will perform as if they were FPM.

IMPORTANT: There are two types of EDO memory--5 Volt and 3.3 Volt. The Power Macintosh 4400 series requires 3.3 Volt EDO memory whereas the Power Macintosh 5500, 6500, and 6400 computers require 5 Volt EDO. The two types of EDO memory are NOT interchangeable. Most 5 V and 3.3 V EDO memory are physically keyed differently to prevent you from using the wrong type, but even if the DIMM can be installed, verify that you are installing the correct type.

Additionally, EDO memory can also be used as video memory in the Power Macintosh 4400 ONLY. However, when using EDO memory as video memory, the Power Macintosh 4400 uses 5 Volt EDO memory rather than the 3.3 Volt used as DRAM.

Power Macintosh Computers that Can Use EDO memory

Although you will not derive any performance benefits by using EDO DIMMs, you can use them in the following Power Macintosh computers:

- Power Macintosh 6100 series
- Power Macintosh 7100 series
- Power Macintosh 8100 series
- Power Macintosh 5200 series
- Power Macintosh 5300 series
- Power Macintosh 5400 series
- Power Macintosh 6200 series
- Power Macintosh 6300 series
- Power Macintosh 6400 series
- Power Macintosh 7500 series
- Power Macintosh 7600 series
- Power Macintosh 8500 series
- Power Macintosh 9500 series
- Macintosh Performa 6360 series
- Some Macintosh Performa 6400 series

Power Macintosh Computers that CANNOT use EDO memory

You cannot use EDO DIMMs in the Power Macintosh 7200 computer. Using EDO memory in the Power Macintosh 7200 computer can cause damage to the logic board and to the DIMMs. Because of this, Apple does not support using EDO memory in the Power Macintosh 7200 computer. Any damage incurred from using EDO memory in the Power Macintosh 7200 computer may not be covered under Apple Computer's limited hardware warranty.

15) Question: What is parity memory and do Power Macintosh computers support it?

Answer: If a computer is designed for parity RAM, the parity bit allows the memory controller to check for DRAM errors in the form of a parity error. A parity error cannot correct system errors, but the system can be designed to alert the user that a memory error has occurred.

Apple's newly-introduced Network Server 500 and 700 products are the only computers that support parity memory; all other Power Macintosh Desktop, Tower, and PowerBook computers do not. Parity memory modules add one parity bit to each byte. Thus, a 64 bit DIMM -- eight bytes -- expands from 64 bits to 72 bits wide.

16) Question: What is ECC memory and do Macintosh computers support it?

Answer: Macintosh computers do not support ECC memory. ECC (Error Correction Coding) memory has additional check bits for each byte. This entails the memory controller calculating and writing error control check bits on each memory write operation, and recalculating and comparing the check bits on memory read operations, and then if necessary correcting the bad bits. As opposed to parity, this can automatically correct single bit RAM errors.

17) Question: My manual suggests that when upgrading my cache, I use

..TIL20575-Power_Macintosh-Memory_FAQ_3-97_(TA36147).pdf

Apple-branded cache. I would like to purchase a 512k cache module, but it does not appear that Apple sells this size. What size should I purchase?

Answer: At this time, 256k is the largest cache module Apple sells for the 7200/7300/7500/7600/8500/8600 models.

This article was published in the Information Alley on 22 October 1996.

Article Change History:

24 Mar 1997 - Added info on largest cache Apple sells.

28 Feb 1997 - Updated information with latest computers.

Color StyleWriter 2500: PhotoGrade Print Kit General Info 10/96

=====

Article Created: 23 October 1996
Article Reviewed/Updated: 24 October 1996

TOPIC -----

This article contains a general Information about the Color PhotoGrade Print Kit (M5577LL/A) including; contents, printing with the Color PhotoGrade Print Kit, tips for color printing, and purchasing supplies.

DISCUSSION -----

Color PhotoGrade Print Kit Contents
=====

In the Color PhotoGrade Print Kit you have everything you need to begin printing photo realistic images on your Color StyleWriter 2500. The kit contains :

- a Color PhotoGrade Ink Cartridge (approx. 45 pages per cartridge)
- a packet of Color Ink Jet PhotoGrade Paper (60 sheets)
- Color StyleWriter 2500 PhotoGrade Updater software (on a floppy disk)
- ink cartridge storage case
- PhotoEnhancer Plus software

Printing with the Color PhotoGrade Print Kit
=====

IMPORTANT:

To get the results you want, you must use the kit contents together. That is, use the Color PhotoGrade Ink Cartridge to print on the Color PhotoGrade Paper, and choose the appropriate settings in the printer dialog box.

Step 1

Install the PhotoGrade ink cartridge in the printer.

Step 2

Load the PhotoGrade paper into the sheet feeder.

Make sure the whiter side faces you.

Step 3

Open the document you want to print.

Step 4

Choose Print from the File menu.

Step 5

Choose PhotoGrade from the Paper Type pop-up menu in the Print dialog box.

Step 6

Click Color.

Step 7

Select Scatter and verify ColorSync is turned on in the Color Options dialog

An X in the checkbox means ColorSync is turned on. Scatter blends the ink colors in a random scattering of dots for the best quality image.

Step 8

Click OK when you are finished.

Step 9

Click Print when you are ready.

Tips for color printing

=====

- You must use the PhotoGrade paper and the PhotoGrade ink cartridge.
- Be sure to load the PhotoGrade paper so the whiter side faces you.
- Choose PhotoGrade from the Paper Type pop-up menu in the Print dialog box.
- Be sure to turn on ColorSync and leave the ColorSync settings on Automatic.
- Select the Scatter halftoning option (instead of Pattern).
- Make sure the ColorSync extension is enabled in your Extensions folder. If it is not, you must reinstall the Color StyleWriter 2500 software that came with your printer.
- If dark streaks or ink stains appear on printed documents, move the internal paper selector to the "envelope" position (leaving a bit more space between the printhead and the surface of the paper).

- The PhotoGrade Updater software does not support QuickDraw GX. You must disable QuickDraw GX before printing with the Color PhotoGrade Print Kit.

Purchasing Supplies

=====

When you run out of PhotoGrade ink or paper, you can purchase replacement supplies from your local reseller. Each item is sold separately.

- Color StyleWriter 2500 Color PhotoGrade Ink Cartridge: M5579G/A
- Color StyleWriter 2500 Color PhotoGrade Paper, Letter-size: M5578G/A
- Color StyleWriter 2500 Color PhotoGrade Paper, A4-size: M5581G/A

AppleVision 1710AV: ADB Devices Can Cause Video Distortion 10/96

Revised: 10/23/96
Security: Everyone

AppleVision 1710AV: ADB Devices Can Cause Video Distortion 10/96

Article Created: 23 October 1996

TOPIC -----

I have an AppleVision 1710AV Display connected to my Power Macintosh. I use my computer primarily for video conferencing. I have noticed that when I am in the highest resolution (1024x768), that the image is blurred slightly.

DISCUSSION -----

The AppleVision 1710AV Display uses the Apple Desktop Bus (ADB) signals to synchronize video scan rates, when scan rates are changed and at startup.

When other peripheral devices use power from the ADB line, this may cause the video image to become slightly blurred when in the highest resolution (1024x768), however less dense formats display properly.

If you remove the devices using power from the ADB line, the image should return to normal. In order to use the ADB devices, you should use an alternate power source, or a different system configuration selected to avoid the loss of sharpness at high pixel density formats.

Other Apple Multiple Scan Displays do not use ADB in this way, and are unaffected by added ADB peripherals.

Macintosh Performa 5400/160 (non-US): Description (10/96)

=====

Article Created: 24 October 1996

TOPIC -----

This article contains a description of the Macintosh Performa 5400/160 computer, which is only available outside of the United States.

DISCUSSION -----

With its state-of-the-art RISC-based processor and advanced multimedia capability, the all-in-one Macintosh Performa 5400/160 computer is ready to inspire your creativity and boost your productivity.

The computer's 160-megahertz PowerPC 603e processor and its 16 megabytes of RAM let you easily run an abundance of Macintosh applications--and there's plenty of room to store them on the 1.6-gigabyte internal hard drive. To get you started, there are more than a dozen learning, home, and entertainment programs, plus a collection of multimedia reference CDs.

The Performa 5400/160 includes a CD-ROM drive for multimedia applications and a 15-inch monitor (12.8-inch diagonal viewable image size) to display vibrant colors. There's also a built-in microphone to directly record your own sounds. Multimedia playback is made more lifelike through the built-in stereo speakers enhanced by SRS 3D surround sound and the Macintosh 16-bit stereo sound system.

To connect to the world of information services, including the Internet, the Performa 5400/160 features a built-in 28.8-kilobit-per-second modem. The modem also allows you to use your computer as a fax or answering machine.

If you need even more advanced capabilities in the future, expansion is easy through the industry-standard Peripheral Component Interconnect (PCI) slot and built-in SCSI support. You can also add the capabilities of watching television in a Macintosh window and recording video from VCRs and video cameras.

The Macintosh Performa 5400/160: A powerful, convenient system for all your home and office computing tasks.

Features

=====

Complete, ready-to-use system

- * Computer, multiple-scan 15-inch color display (12.8-inch diagonal viewable image size), CD-ROM drive, floppy disk drive, hard disk, microphone, and stereo speakers integrated into one convenient package
- * Keyboard, mouse, and all necessary cables
- * Apple System 7.5.3 software, including Apple Guide software for step-by-step help with basic system operation, QuickTime multimedia software, Macintosh PC Exchange software, and QuickDraw 3D
- * Internal 28.8-Kbit/s modem for data, fax, voice, and digital answering machine
- * Built-in 8x-speed, tray-loading CD-ROM drive
- * Front-panel volume control and headphone/speaker jack
- * CD-quality digital sound with SRS 3D surround sound enhancement

Preinstalled software

- * Apple System 7.5.3

Ordering Information

=====

Macintosh Performa 5400/160

Computer with built-in multiple-scan 15-inch display (12.8-inch diagonal viewable image size), 28.8-Kbit/s modem, 1.6GB hard disk, 8x-speed CD-ROM drive, and floppy disk drive. Mouse, keyboard, and cables also included. Check with your Apple reseller for specific configuration information and ordering numbers.

Optional Enhancements

* High Performance Module
(256K level 2 cache)
Order No. M4505LL/A

* Apple Video System
Order No. M2894LL/D

* Apple TV/FM Radio System
Order No. M4586LL/A

* Apple Presentation System
Order No. M2895LL/A

* Apple External Video Connector
Order No. M4099LL/D

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

Macintosh Performa 5400/160 (non-US): Specifications (10/96)

Revised: 10/24/96
Security: Everyone

Macintosh Performa 5400/160 (non-US): Specifications (10/96)

=====

Article Created: 24 October 1996

TOPIC -----

This article contains the technical specifications for the Macintosh Performa 5400/160 computer, which is only available outside of the United States.

DISCUSSION -----

Technical Specifications

=====

Microprocessor

- * PowerPC 603e processor running at 160 MHz
- * 32K internal cache
- * Integrated floating-point unit
- * 64-bit memory bus
- * Optional High Performance Module (256K level 2 cache)

Memory

=====

- * Comes with 16 MB of RAM (8 MB on the logic board and an 8MB DIMM in one of the DIMM sockets)
- * Can be expanded to 136 MB using two 64 MB DIMMs
- * Uses 64-bit-wide, 168-pin, 70-nanosecond or faster, fast-paged-mode DIMMs (1K and 2K refresh)

Disk drives

=====

- * Internal 1.6GB hard disk drive
- * Internal Apple SuperDrive floppy disk drive
 - Uses high-density, 1.4MB floppy disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- * Internal AppleCD 8x-speed CD-ROM drive

Display

=====

Built-in display

- * 15-in. RGB color display (12.8-in. diagonal viewable image size)
- * 0.28-mm dot pitch
- * Noninterlaced, flat, square cathode-ray tube (CRT)
- * User-adjustable resolutions from 640 by 480 pixels to 832 by 624 pixels
- * Resolution can be changed without restarting the computer
- * Refresh rate up to 75 Hz
- * Built-in base tilts from -5 to +15 degrees, swivels a full 360 degrees
- * Meets SWEDAC MPR2 international guidelines for magnetic-field emissions

Display support

- * 16-bit color for display of up to 32,768 colors at 640- by 480-pixel or 800- by 600-pixel resolution
- * 8-bit color for display of 256 colors at 832- by 624-pixel resolution
- * 1MB video frame buffer (independent of system RAM)

Built-in modem

=====

- * 28.8-Kbit/s, V.34, data/fax/voice modem
- * Works with supplied software to provide answering machine capability
- * Built-in error correction and compression (MNP4, V.42, MNP5, V.42bis)

Sound

=====

- * Stereo 16-bit sound
- * Built-in stereo speakers
- * Built-in microphone
- * Sound-output port
- * Sound-input port
- * Front headphone jack and volume control
- * Apple sound enhancements, including SRS 3D surround sound

Expansion interfaces

=====

- * PCI expansion slot for industry-standard 6.88-in., 15-watt expansion cards
- * Apple Desktop Bus port for mouse, keyboard, and other devices (multiple devices can be connected to each other from one port)
- * RS-232/RS-422 serial port for an AppleTalk network connection, other networking connections, communications equipment (including GeoPort-compatible devices), or a printer
- * SCSI interface port for as many as six external SCSI devices, such as disk drives, CD-ROM drives, and/or digital scanners
- * Optional video-out port for connection to an external monitor for video mirroring (also supports connection to an NTSC or PAL video-out interface box, such as the Apple Presentation System)
- * Communications slot (used by the built-in 28.8-Kbps data/fax/voice modem)
- * Video slot (used by the optional Apple Video System to connect a VCR, video camera, or other video equip-ment; supports both composite and S-video input)
- * TV tuner slot (used by the optional Apple TV/FM Radio System)

Electrical requirements

=====

- * Line voltage: 110 to 240 V AC, RMS, single phase, nominal
- * Frequency: 50 to 60 Hz
- * Power: 220 W maximum (continuous)
- * Includes low-power sleep mode
- * U.S. EPA Energy Star compliant

Size and weight

=====

- * Height: 17.5 in. (44.5 cm)
- * Width: 15.1 in. (38.3 cm)
- * Depth: 16 in. (40.6 cm)
- * Weight: 47 lb. (21 kg)

Operating environment

=====

- * Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- * Storage temperature: -40 to 116 degrees F (-40 to 47 degrees C)
- * Relative humidity: 5% to 95%, noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Disability access

=====

- * CloseView software magnifies screen image up to 16 times
- * Easy Access software permits combination keys to be pressed sequentially and enables cursor control from the numeric keypad instead of the mouse
- * "Visual beep" replaces audible system alerts

Macintosh Performa 5400/180 (non-US): Description (10/96)

Revised: 10/24/96
Security: Everyone

Macintosh Performa 5400/180 (non-US): Description (10/96)

=====

Article Created: 24 October 1996

TOPIC -----

This article contains the specifications for the Macintosh Performa 5400/180 computer.

IMPORTANT: This computer is only available for sale outside of the United States.

DISCUSSION -----

From its state-of-the-art RISC-based processor to its sleek graphite color, the Apple Macintosh Performa 5400/180 computer is like no other Macintosh you've ever seen. This sophisticated all-in-one system is ready to use right out of the box, with everything you need to inspire your creativity and increase your productivity.

The computer's 180-megahertz PowerPC 603e processor and 16 megabytes of RAM let you easily run an abundance of Macintosh applications--and there's plenty of room to store them on the 1.6-gigabyte internal hard drive. To get you started, there are more than a dozen learning, home, and entertainment programs, plus a collection of multimedia reference CDs.

The Performa 5400/180 includes multimedia features that are expensive add-ons with other computers, including a CD-ROM drive for multimedia applications and a 15-inch monitor (12.8-inch diagonal viewable image size) to display vibrant colors. Using the built-in capabilities, you can watch television in a window, listen to FM radio, and view and record video from VCRs and video cameras. There's also a built-in microphone to directly record your own sounds. These multimedia features are made more lifelike through the built-in stereo speakers enhanced by SRS 3D surround sound and the Macintosh 16-bit stereo sound system.

To connect to the world of information services, including the Internet, the Performa 5400/180 features a built-in 28.8-kilobit-per-second modem. The modem

also allows you to use your computer as a fax or answering machine.

If you need even more advanced capabilities in the future, expansion is easy through the industry-standard Peripheral Component Interconnect (PCI) slot and built-in SCSI support.

The Macintosh Performa 5400/180: Performance, convenience, and sophistication that will add elegance to your home or office.

Features

=====

Complete, ready-to-use system

- * Computer, multiple-scan 15-inch color display (12.8-inch diagonal viewable image size), CD-ROM drive, floppy disk drive, hard disk, microphone, and stereo speakers integrated into one convenient and stylish package
- * Apple TV/FM Radio System and video input
- * Matching keyboard, mouse, and all necessary cables
- * Apple System 7.5.3 software, including Apple Guide software for step-by-step help with basic system operation, QuickTime multimedia software, Macintosh PC Exchange software, and QuickDraw 3D
- * Internal 28.8-Kbit/s modem for data, fax, voice, and digital answering machine
- * Built-in 8x-speed, tray-loading CD-ROM drive
- * Front-panel volume control and headphone/speaker jack
- * CD-quality digital sound with SRS 3D surround sound

Preinstalled software

- * Apple System 7.5.3

Ordering Information

=====

Macintosh Performa 5400/180

Computer with built-in multiple-scan 15-inch display (12.8-inch diagonal viewable image size), 28.8-Kbit/s modem, 1.6GB hard disk, 8x-speed CD-ROM drive, floppy disk drive, Apple TV/FM Radio System, and video input. Mouse, keyboard, and cables also included.

Optional Enhancements

- * High Performance Module
(256K level 2 cache)
Order No. M4505LL/A
- * Apple Presentation System
Order No. M2895LL/A
- * Apple External Video Connector
Order No. M4099LL/D

At Ease 3.0.3 Read Me (10/96)

Revised: 10/24/96
Security: Everyone

At Ease 3.0.3 Read Me (10/96)

=====

Article Created: 24 October 1996

TOPIC -----

This article is the At Ease 3.0.3 ReadMe file.

DISCUSSION -----

This document reflects the latest information on At Ease version 3.0.3. Please read this document carefully. The software may have changed slightly since the manual was printed.

Installing At Ease

You should use the Installer program to install At Ease. Do not attempt to install At Ease by dragging files onto your hard disk. The Installer places the files in the correct locations on the disk.

Before using the At Ease Installer program, make sure you have quit all other application programs. If you have trouble installing, temporarily turn off all extensions by holding down the Shift key while you restart your computer. Then try installing again.

If you install At Ease 3.0.3 on a computer running system software version 7.0 or 7.1 and you later install version 7.5 on your computer, use the Custom Install option of the At Ease Installer to install the At Ease Guides. If you are using the Custom Install option and you check one or more features to be installed, the selected size field may be incorrect. You can click the small Info button for each selected feature to look at the actual size.

Installing Mouse Practice

If your version of At Ease came with Mouse Practice, install it immediately after installing At Ease.

Removing At Ease

If you decide to remove At Ease, use the At Ease Installer program. Never attempt to remove At Ease from your System Folder while At Ease is turned on. See the manual for more information on removing At Ease.

Getting Help in At Ease

In addition to the manual and this Read Me file, there are several ways of obtaining online help in At Ease.

Apple Guide (System 7.5 Users)

If you are using system software version 7.5 or later, you can use Apple Guide to get instructions for using At Ease. At Ease Guide, the Apple Guide for the At Ease panels, is available from the Guide menu whenever At Ease is the active application program. At Ease Setup Guide, the Apple Guide for the At Ease Setup program, is available from the Guide menu whenever At Ease Setup is the active program.

At Ease Setup Help (System 7.0 or 7.1 Users)

If you are using system software version 7.0 or 7.1, At Ease includes online help for the At Ease Setup program. To use At Ease Setup Help, click the question mark button that appears on each page of the At Ease Setup program.

Balloon Help

Balloon Help is available for almost every function of At Ease. To activate Balloon Help, choose Show Balloons from the Guide menu (system software version 7.5) or the Help menu (system software version 7.0 or 7.1). When you are finished using Balloon Help, choose Hide Balloons from the Guide menu or Help menu.

Upgrading From Earlier Versions of At Ease

For most upgrades, your administrator password (if you had one) will remain the same in the At Ease Setup program in version 3.0.3. When the At Ease Setup program asks for an administrator name, type "At Ease Administrator," which is the default administrator name.

Upgrading From Version 1.x

If you are upgrading from At Ease version 1.x to version 3.0.3, you must first remove the old version by using the At Ease Installer program that came with the old version. When the Installer screen appears, hold down the Option key to change the Install button to Remove. Then click Remove to remove the old version.

Any items you created in version 1.x are automatically assigned to a setup or user named At Ease 1.0.

Upgrading From Version 2.x

Upgrading from version 2.x to version 3.0.3 occurs automatically when you first run the At Ease Setup program of version 3.0.3. At Ease turns itself off at the end of the installation process, so you must run the At Ease Setup program to turn At Ease back on.

Installing Other Programs While Running At Ease

You should not install programs onto your hard disk while running At Ease. Before you install programs, turn At Ease off in the At Ease Setup program and restart your computer. When you finish installing programs, turn At Ease back on and restart the computer again. Programs you install onto your hard disk are not automatically added to At Ease setups or users; you must use the At Ease Setup program to provide access to the new programs.

If some program buttons are not displayed properly in At Ease after you install new software, you should rebuild your desktop. To do so, turn At Ease off and restart your computer. While the computer is restarting, hold down the Command and Option keys until you see a message asking whether you want to rebuild the desktop file. Click OK. When the computer has finished starting up, turn At Ease back on in the At Ease Setup program and restart the computer again.

Restrictions on Floppy Disk Use

Floppy disks can be used only if a user has been given the access privileges to open and save documents on floppy disks. If a user is not allowed to open and save on floppy disks, any disk the user inserts will be ejected.

Restricted Finder Users

There are several things you should know about the restricted Finder environment.

Security in the Restricted Finder

In trying to maintain compatibility with other programs, the restricted Finder environment can sometimes allow programs to bypass some of the security features you selected in the At Ease Setup program. If programs you use seem to pose security problems, you may want to remove them from your hard disk.

Security is maintained for restricted Finder users by creating a list of "approved" application programs, desk accessories, and control panels that can be opened by the user. This list includes

- all items in the current setup folder
- items in the Apple Menu Items folder (if you have given access to them)
- the Chooser (if you have given access to it)
- the Print Monitor
- items in the Startup Items folder (only if the setup will open them)
- items in the Shutdown Items folder
- items in the Control Panels folder (if you have given access to them)
- the At Ease Setup program (administrator password required)
- approved sublaunched programs (for more information, see "Sublaunching Programs" later in this Read Me file)

If a document exists in any of these places, the application that created the document can also be opened.

The At Ease Setup program can always be opened because the administrator password restricts access.

The list of approved programs does not include programs in the user's own documents folder. (If it did, a user could copy a program from a floppy disk to his or her documents folder and attempt to open it without permission.)

Macintosh Guide and the Restricted Finder

Because of changes in the Finder made for restricted Finder users, instructions in Macintosh Guide (available from the Guide menu in system software version 7.5 or later) may not always be accurate. For example, when users who do not have access to control panels use Macintosh Guide to request instructions on adjusting the sound volume, they will not be able to complete the required steps.

Desktop Items and the Restricted Finder

When a user connects to (mounts) a disk other than the startup disk, items on the desktop of the disk are placed in a folder called "Items for Desktop," located at the top level of that disk. When the user disconnects from (unmounts) the disk, the items are not replaced on the desktop.

Copying in the Restricted Finder

If a user drags a folder for which he or she doesn't have access (such as another user's folder) into his or her own folder, the computer will not copy any files from the dragged folder, but it will add an empty folder of the same name to the hierarchy for the user's folder.

File Sharing and the Restricted Finder

File sharing does not work with the restricted Finder. When a restricted Finder user logs in, At Ease turns off file sharing. The next regular Finder user who logs in and wants to use file sharing must return to the Sharing Setup control panel and turn file sharing on again.

Do not use file sharing on computers that will be updated via the Update Computers command in At Ease Setup.

RAM Disks and the Restricted Finder

Do not use RAM disks if any user works in the restricted Finder; doing so may cause your computer to crash.

Sublaunching Programs

Sublaunching is the process by which one program opens another program (called a subprogram) without the user having directly opened the subprogram. The security

features of At Ease can sometimes interfere with a program's ability to sublaunch necessary subprograms. When a program attempts to sublaunch a subprogram to which a user has not been given access, the computer usually displays a -5000 error code.

There are two ways to allow programs to sublaunch the subprograms they need. In either case, the subprogram bypasses the security that At Ease provides.

- In the At Ease Setup program, open the Settings menu and choose Application Preferences. Add the necessary subprograms to the list, then select each subprogram and click the checkbox labeled "Can be launched by other applications." This setting applies to all users and setups, so you need to follow this procedure only once. You should be aware that this setting allows all users—including restricted Finder users—to open the subprogram.
- In the At Ease Setup program, give access to all the necessary subprograms. This procedure allows you to specify which users or setups have access to the subprograms. The disadvantage of this procedure, however, is that users see a button for each subprogram even though they normally won't need to open the subprograms directly.

At Ease 3.0.3 and Kid Pix Studio

Kid Pix Studio sublaunches each subprogram a child uses. But because of a software incompatibility, At Ease does not view these subprograms as application programs. To allow Kid Pix Studio to sub-launch its subprograms successfully, choose Application Preferences from the Settings menu of At Ease Setup and click the Custom button in the screen that appears. In the Custom Add screen, add each of the following subprograms:

Name	File Creator
-----	-----
KPS 0	Kîd0
KPS 1	Kîd1
KPS 2	Kîd2
KPS 3	Kîd3
KPS 4	Kîd4
KPS 5	Kîd5

To type the î character in the file creator names, hold down the Option key while you type the letter i, then release the Option key and immediately type the letter i again.

For more information on using the Custom Add screen, see "Application Preferences" later in this Read Me file.

At Ease 3.0.3 and Control Panels

Users who start out in the At Ease panels and switch to the Finder may experience problems when opening control panels. If they choose Control Panels from the Apple menu of the Finder, the Control Panels folder appears as expected. If they choose a particular control panel from the Control Panels submenu, however, they are returned to the At Ease panels. In most cases, the

selected control panel appears in front of the At Ease panels. But for certain control panels, such as the Extensions Manager in system software version 7.5, a message appears saying that the selected control panel can't be opened in At Ease.

To avoid these problems, At Ease users who switch to the Finder should not use the Control Panels submenu. Instead, they should choose Control Panels from the Apple menu of the Finder and then double-click the control panel they want in the Control Panels window that appears.

At Ease 3.0.3 and CD-ROM Discs

At Ease can display only one CD-ROM panel at a time. If a user inserts another CD-ROM disc to which he or she has access, a message appears indicating that the disc can be accessed using buttons. If the user ejects the first CD-ROM disc, the second CD-ROM disc appears as a panel.

The CD-ROM Preferences feature does not work properly with audio CDs.

At Ease 3.0.3 and the Find File Feature in System 7.5

While At Ease is running, Find File finds only those items in locations to which the user has complete access, including the user's documents folder and the Trash folder. Most other locations (including server volumes and the user's setup folder) do not return any information when Find File is used.

At Ease 3.0.3 and the Startup Items Folder in System 7.5

Any item in the Startup Items folder will be opened at startup, even if you didn't give the user access to the item or to the program used to create it. If you don't want all users to have access to an item, don't place the item in the Startup Items folder.

Application Preferences

The Custom button in the Application Preferences screen should be used only when At Ease security settings are interfering with a program's ability to sublaunch other programs that it needs and the "Can be launched by other applications" setting doesn't solve the problem. It is very unlikely that you will need to use the Custom button.

When you click the Custom button, the Custom Add screen appears. You provide a name (which can be anything you like, since it's needed only for display in the list of applications) and the file creator for each subprogram you are having difficulty sublaunching. You must type the file creator exactly, including any spaces and special characters. (You can usually get the name of the file creator from the developer of the software.)

The Custom button also allows you to remove programs from the Application Preferences list—even programs that you added to the list using the Add Other button. To do so, click a program's name in the list and click the Custom button. If the Custom Add screen does not already include a name and file creator for the program, type the program's name (exactly as it appears in the

list) and its file creator. Then click Remove.

Macintosh Performa 5400/180: Specifications (10/96)

Revised: 10/24/96
Security: Everyone

Macintosh Performa 5400/180: Specifications (10/96)

=====

Article Created: 24 October 1996

TOPIC -----

This article contains the technical specifications for the Macintosh Performa 5400/180 computer.

IMPORTANT: This computer is only available for sale outside of the United States.

DISCUSSION -----

Microprocessor

=====

- * PowerPC 603e processor running at 180 MHz
- * 32K internal cache
- * Integrated floating-point unit
- * 64-bit memory bus
- * Optional High Performance Module (256K level 2 cache)

Memory

=====

- * Comes with 16MB of RAM (uses one DIMM socket)
- * Can be expanded to 136MB using two 64MB DIMMs
- * Uses 64-bit-wide, 168-pin, 70-nanosecond or faster, fast-paged-mode DIMMs (1K and 2K refresh rate)

Disk drives

=====

- * Internal 1.6GB hard disk drive
- * Internal Apple SuperDrive floppy disk drive
 - Uses high-density, 1.4MB floppy disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- * Internal 8x-speed CD-ROM drive

Display

=====

Built-in display

- * 15-in. RGB color display (12.8-in. diagonal viewable image size)
- * 0.28-mm dot pitch
- * Noninterlaced, flat, square cathode-ray tube (CRT)
- * User-adjustable resolutions from 640 by 480 pixels to 1,024 by 768 pixels
- * Resolution can be changed without restarting the computer
- * Refresh rate up to 75 Hz
- * Built-in base tilts from -5° to +15°, swivels a full 360°
- * Meets SWEDAC MPR2 international guidelines for magnetic-field emissions

Display support

- * 16-bit color for display of up to 32,768 colors at 640- by 480-pixel or 800- by 600-pixel resolution
- * 8-bit color for display of 256 colors at 832- by 624-pixel or 1,024- by 768-pixel resolution
- * 1 MB video frame buffer (independent of system RAM)

Built-in modem

=====

- * 28.8-Kbit/s, V.34, data/fax/voice modem
- * Works with supplied software to provide answering machine capability
- * Built-in error correction and compression (MNP4, V.42, MNP5, V.42bis)

Sound

=====

- * Stereo 16-bit sound
- * Built-in stereo speakers
- * Built-in microphone
- * Sound-output port
- * Sound-input port
- * Front headphone jack and volume control
- * Apple sound enhancements, including SRS 3D surround sound

Expansion interfaces

=====

- * PCI expansion slot for industry-standard 6.88-in., 15-watt expansion cards
- * Apple Desktop Bus port for mouse, keyboard, and other devices (multiple devices can be connected to each other from one port)
- * RS-232/RS-422 serial port for an AppleTalk network connection, other networking connections, communications equipment (including GeoPort-compatible devices), or a printer
- * SCSI interface port for as many as six external SCSI devices, such as disk drives and/or CD-ROM drives
- * Optional video-out port for connection to an external monitor for video mirroring (also supports connection to an NTSC or PAL video-out interface box, such as the Apple Presentation System)
- * Communications slot (used by the built-in 28.8-Kbit/s data/fax/voice modem)
- * Video slot (used by the Apple Video System to connect a VCR, video camera, or other video equipment; supports both composite and S-video input)

- * TV tuner slot (used by the Apple TV/FM Radio System)

Electrical requirements

=====

- * Line voltage: 110 to 240 V AC, RMS, single phase, nominal
- * Frequency: 50 to 60 Hz
- * Power: 220 W maximum (continuous)
- * Includes low-power sleep mode
- * U.S. EPA Energy Star compliant

Size and weight

=====

- * Height: 17.5 in. (44.5 cm)
- * Width: 15.1 in. (38.3 cm)
- * Depth: 16 in. (40.6 cm)
- * Weight: 47 lb. (21 kg)

Operating environment

=====

- * Operating temperature: 50° to 104° F (10° to 40° C)
- * Storage temperature: -40° to 116° F (-40° to 47° C)
- * Relative humidity: 5% to 95%, noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Disability access

=====

- * CloseView software magnifies screen image up to 16 times
- * Easy Access software permits combination keys to be pressed sequentially and enables cursor control from the numeric keypad instead of the mouse
- * "Visual beep" replaces audible system alerts

At Ease: ClarisWorks Document in Shared Folder (10/96)

Revised: 10/24/96
Security: Everyone

At Ease: ClarisWorks Document in Shared Folder (10/96)

=====

Article Created: 24 October 1996

TOPIC -----

I put a ClarisWorks document into the shared folder for my users to use as a template. But when more than one user tries to open the document it says "This item could not be used because it contains items that are in use." How do I let all of my users access this document at the same time?

DISCUSSION -----

To do this, you must save the ClarisWorks document as "stationary." This will let all of your users access that document and use it as a template.

QuickTime: What is CoolTalk? - Description (10/96)

Revised: 10/25/96
Security: Everyone

QuickTime: What is CoolTalk? - Description (10/96)

=====

Article Created: 25 October 1996

TOPIC -----

I've seen some discussions mentioning CoolTalk. What is it?

DISCUSSION -----

Apple Computer Inc. and Netscape are collaborating on a video conferencing part of Navigator called CoolTalk. CoolTalk allows Navigator users to audio conference to any other CoolTalk client (Macintosh, Windows, or various flavors of Unix) as well as share data. When a Macintosh based CoolTalk user connects to another Macintosh-based CoolTalk user, they can also use video.

As of September 1996, CoolTalk is still a beta product. Since Netscape usually opens up their beta software to the public, it is available to Netscape users as public beta software.

CoolTalk is based on QuickTime Conferencing. CoolTalk has both Apple's and Netscape's name on the product, but it is distributed and supported by Netscape.

Systems Supported

=====

- * Windows 3.1/NT/95
- * MacOS 7.5.3 - Power Macintosh only
- * HP-UX 9.0X
- * IRIX 5.x
- * OSF1 3.2
- * Solaris 2.4 or higher
- * SunOS 4.1.3 or higher

Requirements

- * PC - 486 class with 8MB of RAM, running MS Windows 95, NT, or 3.1

- * Macintosh - Power Macintosh with System Software 7.5.3 or higher
- * Unix - Solaris 1, Solaris 2, HP-UX, Irix, or Digital Unix (with Multimedia Services)
- * 9600 bps or faster TCP/IP Internet connection (28800 or faster for Macintosh)
- * Sound card (Windows compatible for PC, Macintosh built-in sound)
- * Microphone and speakers (if you wish to use the audio features; external speakers/headphones recommended)

For additional information on CoolTalk, visit Netscape's homepage.

Macintosh Performa: No Hard Disk to Restore On (11/96)

Revised: 11/12/96
Security: Everyone

Macintosh Performa: No Hard Disk to Restore On (11/96)

=====

Article Created: 28 October 1996
Article Reviewed/Updated: 12 November 1996

TOPIC -----

I am attempting to use the system software CD-ROM disc to restore the system software on my Macintosh Performa 6400 computer. However, when I run the Apple Restore program an error message appears stating, "No hard disk to restore on". How can I restore the system software?

DISCUSSION -----

The likely cause of this error is starting up the computer using the Shift-Option-Command-Delete key sequence. Holding down these keys at startup forces the system to start up from the next SCSI device (above 0), which is the CD-ROM disc. However, if you start up the computer using this key sequence on a computer with an IDE hard drive, the system may have difficulty seeing the hard disk.

Instead, you should start up the computer while holding down the C key (lower case) when you need to restore your system software. (This is noted in the User's Manual for the Macintosh Performa 6400 series computers)

Holding down the C key at startup has the same effect as does the Shift-Option-Command-Delete key sequence, but it allows the hard drive to be properly recognized.

MegaPhone: GeoPort Telephone Tool Named Changed (10/96)

Revised: 10/28/96
Security: Everyone

MegaPhone: GeoPort Telephone Tool Named Changed (10/96)

=====

Article Created: 28 October 1996

TOPIC -----

I installed the GeoPort-EM 3.0 Update, now when I launch MegaPhone I get a message stating that the GeoPort(tm) Telephone Tool cannot be found. Will use GeoPort Telephone Tool Instead temporarily. Why?

DISCUSSION -----

The name of the GeoPort Telephone Tool changed in the GeoPort-EM 3.0 Update. The trademark symbol was dropped from the extension.

Workaround

In order to avoid getting error message every time you launch MegaPhone, you need to change the connection tool.

Step 1

Launch MegaPhone

Step 2

Choose Preferences from the File menu

Step 3

Click the Change button under Hardware.

Step 4

Choose GeoPort Telephone Tool

Step 5

Click OK.

Macintosh 6360,6400,5400: SCSI Devices Aren't Recognized (2/97)

Revised: 2/28/97
Security: Everyone

Macintosh 6360,6400,5400: SCSI Devices Aren't Recognized (2/97)

=====

Article Created: 29 October 1996
Article Reviewed/Updated: 25 February 1997

TOPIC -----

We are trying to use SCSI devices with our Macintosh Performa and Power Macintosh 6360, 6400, and 5400 series computers, but some of the devices are not being recognized.

- * Is this a known issue with these computers?
- * If so, what is the solution?

DISCUSSION -----

Yes, Apple is aware of some timing issues with SCSI on these computers. However, many SCSI problems can be attributed to termination, cable or SCSI ID issues. Be sure to follow standard SCSI troubleshooting before assuming this is a SCSI timing problem. Also, verify that any software required for your particular SCSI device is properly installed. For more information, check the manuals that came with the computer and SCSI device. Or, use the search strings "connecting and SCSI" or "0009387" in the Tech Info Library to locate the article, "Macintosh: Connecting SCSI Devices".

Apple has developed an update for the Macintosh Performa and Power Macintosh 6360, 6400, and 5400 series computers to correct a SCSI timing issue that can occur when using some SCSI devices. Apple developed this update based on reports from users who are having difficulty using some UMAX and Agfa scanners and some SCSI-based printers such as the Apple LaserWriter II SC, Personal LaserWriter SC, and some GCC SCSI-based printers. The 6360/64xx/54xx Update is available from the Apple Software Updates sites. Apple plans on including this update in future versions of the Mac OS.

The 6360/64xx/54xx Update fixes have been rolled into Mac OS 7.6. If you have installed Mac OS 7.6, you do not need the 6360/64xx/54xx Update.

The 6360/64xx/54xx Update disk will do the following:

* Fix issues with using some external SCSI devices, such as external hard disks, scanners, or removable storage devices.

* Fix issues with printing to a Personal LaserWriter SC or LaserWriter II SC printer.

Apple recommends using the LaserWriter IISC GX printer driver under QuickDraw GX, as there are known line layout problems with the non-GX Personal LaserWriter SC printer driver. QuickDraw GX can be installed from your System Software CD that came with your computer. Or, if you do not have QuickDraw GX, it is available from Apple's Software Update sites.

* Add support for additional Ethernet network protocols. If your computer uses the optional Ethernet CS II card to provide Ethernet networking, the 6360/64xx/54xx Update installs files that provide support for the MacIPX and Local Area Transport (LAT) network protocols.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Network Server: How To Eject A Floppy Disk (10/96)

=====

Article Created: 29 October 1996

TOPIC -----

On my RS6000, I have an eject button for the floppy drive. On the Apple Network Server, there is no eject button. How do I get the floppy disk out?

DISCUSSION -----

Open a terminal window (if you are in CDE) and type the command "fdeject" to eject the floppy disk.

PowerBook: What Is Trackpad Climate Control? (10/96)

Revised: 10/29/96
Security: Everyone

PowerBook: What Is Trackpad Climate Control? (10/96)

=====

Article Created: 29 October, 1996

TOPIC -----

This article contains the text of the Read Me file for the Trackpad Climate Control software.

DISCUSSION -----

What Is Trackpad Climate Control?

Trackpad Climate Control is a system extension that will reduce or eliminate unexpected movements of the pointer caused by moisture on the trackpad or humidity. The extension is designed for the Macintosh PowerBook 190, Macintosh PowerBook 1400, and Macintosh PowerBook Duo 2300.

Who Should Use Trackpad Climate Control?

You should use Trackpad Climate Control if you notice the pointer moving abruptly when you initially touch the trackpad or "jumping" to its previous position when you lift your finger after moving the pointer or tapping the trackpad.

Do not use Trackpad Climate Control if you have not had pointer-movement problems on your computer. (The extension could make the pointer less responsive when you use the trackpad.)

The extension works only with the PowerBook 190, PowerBook 1400, and PowerBook Duo 2300.

Installing Trackpad Climate Control

Follow these steps to install the extension.

1. Drag the Trackpad Climate Control icon to the icon of the System Folder on your computer's hard disk.

2. When a message appears, click OK to place the file in the Extensions folder.
3. Restart your computer.

Pointer Movement with Trackpad Climate Control Installed

The Trackpad Climate Control extension monitors pointer movements and attempts to eliminate the undesired jumps that can result from moisture on or around the trackpad. Because the extension affects pointer movement, you may notice that the pointer is somewhat less responsive when you use the trackpad.

Once you've installed the Trackpad Climate Control, you can turn it off with the Extensions Manager control panel (by removing the checkmark beside its name in the control panel and restarting the computer).

Mac Display Card 24AC: ROM V1.0 Isn't Compat w/7.5.3 (10/96)

Revised: 10/30/96
Security: Everyone

Mac Display Card 24AC: ROM V1.0 Isn't Compat w/7.5.3 (10/96)

Article Created: 30 October 1996

TOPIC -----

I just upgraded from Mac OS version 7.5.1 to 7.5.3 and now I am unable to use my 24AC Display Card. When I change resolutions or the bit depth (number of colors displayed), the screen is not legible. What could be happening?

DISCUSSION -----

The symptom you are describing is related to the ROM version of the Macintosh Display Card 24AC. Version 1.0 of the ROM is not compatible with System 7.5.3 or greater. When Apple shipped the Macintosh Display Card 24AC, it had ROM v1.1 installed. ROM version 1.1 is fully compatible with System 7.5.3 and greater.

The only way you would have ROM version 1.0 on your Macintosh Display Card 24AC would be if you had a DVT card (developer version) or the card was purchased from Radius.

Identifying ROM Versions

=====

To identify what version of the ROM is installed on the Macintosh Display Card 24AC, look for a label on the solder side of the display card. The label has Mac Display Card 24AC printed on it. A Bar Code number is also printed on the card. If the Macintosh Display Card 24AC

If you have a DVT card, contact Apple Computer, or your local Service Provide to get a replacement card. If you have a Radius version of the display card, contact Radius for additional help and instructions.

Early Childhood Connections: Description (10/96)

Revised: 10/30/96
Security: Everyone

Early Childhood Connections: Description (10/96)

=====

Article Created: 30 October 1996

TOPIC -----

This article contains a description of the Early Childhood Connections Bundle.

DISCUSSION -----

Early Childhood Connections is a developmentally appropriate, computer-based learning program designed to introduce early number and language concepts, problem solving, music, and creative arts to children ages three through five. The program combines hardware, software, books, and interactive CD-ROMs to create a multisensory learning environment for young children.

Powerful, easy-to-use computer

The Apple Macintosh computer is so easy to use that teachers and students are free to concentrate on learning concepts--not computer skills. And Apple's At Ease interface, through graphics and sound, allows very young children access to their own work, while offering protection for teacher files and programs. Yet for all this ease of use, the Macintosh is a powerful machine that can be upgraded as your computing needs grow.

Resources for students

The library of innovative software for the very young is designed to promote learning through exploration that involves animation and sound. A selection of children's literature is provided to expand the learning possibilities inherent in the software.

Resources for the teacher

Software is provided to help teachers create high-quality newsletters and classroom materials. And to facilitate teachers' instructional efforts, the Teacher Resource Guide offers ideas on how to integrate technology into your classroom. In addition, toll-free technical support is provided for the lifetime

of your product.

Open-ended design

Best of all, Early Childhood Connections is flexible, and its open-ended design allows teachers to create dynamic learning environments and easily integrate the program into existing classroom practices.

Purchase Options

=====

Choose the featured solution--a convenient way to order a Power Macintosh 5260/120 computer and the Early Childhood Connections Kit with just one part number.

or

Choose one of the other computers listed below and order the computer and kit separately. Both items must appear on the same purchase order.

Computer Options

=====

Power Macintosh 5260/120 (featured computer)

Equipped with 16 MB of RAM, built-in 14-inch color display, 1.2 GB hard disk drive, 8x-speed CD-ROM drive, stereo speakers and microphone, AppleDesign Keyboard, and mouse.

Power Macintosh 5400/180

Equipped with 16 MB of RAM, built-in tilt-and-swivel 15-inch color multiple-scan display, 1.2 GB hard disk drive, 8x-speed CD-ROM drive, Ethernet networking, video-input/output, stereo speakers and microphone, AppleDesign Keyboard, and mouse; includes a PCI expansion slot.

Power Macintosh 6400/200

Equipped with 16 MB of RAM, 256K level 2 cache, 2.4 GB hard disk drive, 8x-speed CD-ROM drive, Ethernet networking, microphone, AppleDesign Keyboard, and mouse; includes two 7-inch PCI expansion slots; supports 16-bit color for display of up to 32,768 colors on a variety of monitors. (Monitor is sold separately.)

Early Childhood Connections Kit

=====

The kit includes:

Two-Volume Binder Set

-
- * Volume 1, Teacher Resource Guide: A manual that provides a thematic approach to curriculum integration.
 - * Volume 2, Student Software: User documentation for all software included in the software library.

Early Childhood Connections Installation CD

Contains the software applications. See descriptions that follow.

* Four Books on CD-ROM

- Just Grandma and Me from Living Books, a Random House/Brøderbund Company
- A Silly Noisy House from The Voyager Company
- My Silly CD of Colors from Discis Knowledge Research, Inc.
- My Silly CD of Counting from Discis Knowledge Research, Inc.

* Two Children's Books

- We Are All Alike ... We Are All Different from Scholastic Inc.
- Sing a Song of Popcorn from Scholastic Inc.

* At Ease from Apple Computer, Inc.

An easy-to-use alternative to the standard Macintosh user interface that has been specially designed for young children.

* Bailey's Book House from Edmark Corporation

Five activities designed to provide early literacy experiences for children, including learning letter names and sounds, playing with rhymes, and composing a story.

* Davidson's Kid Works 2 from Davidson & Associates, Inc.

A word processing program specifically geared to the needs of the very young, with a built-in text-to-speech feature that lets children create and then hear their own illustrated stories.

* Easy Street from Mindplay

A child's classification program that uses a shopping metaphor to introduce such concepts as memory, problem solving, and matching.

* Kid Pix 2 from Broderbund Software, Inc.

A multimedia paint program and supplemental software designed especially to help young artists get started, with helpful features such as a talking alphabet and a number of "rubber-stamp" images.

* Millie's Math House from Edmark Corporation

Six activities that lead young learners through an exploration of basic mathematical concepts, such as numbers, counting, and patterns.

* The Writing Center from The Learning Company

An easy-to-use word processing and page-layout program that makes it a snap for teachers to create high-quality, visually appealing documents such as parent handouts and newsletters.

Additional Product Information

=====

Setup and Consultation

Setup of your Early Childhood Connections computer is optional. An authorized Apple representative will come out to your location, set up your system, and answer any questions you have about getting started with your new equipment.

Technical Support

With your Early Childhood Connections purchase, you are entitled to toll-free telephone support for the lifetime of your product. Support service is available from 7 a.m. to 6 p.m. Pacific time, Monday through Friday, excluding holidays. If you have any questions, just call 1-800-800-APPL (2775).

Apple Education Finance Program

For information on the advantages of leasing Early Childhood Connections, please contact the Apple Education Finance Program at 1-800-255-2652.

Math Education Bundle: Description (10/96)

Revised: 10/30/96
Security: Everyone

Math Education Bundle: Description (10/96)

Article Created: 30 October 1996

TOPIC -----

This article contains a description of the Apple Education Series: Math Grades 5-8 Bundle.

DISCUSSION -----

When schools put computers on students' desktops, the teachers and students both benefit. Now Apple has made that easier to do.

The Apple Education Series Math: Grades 5-8 Bundle provides a Macintosh computer and the Math: Grades 5-8 Kit--a collection of some of the most useful math software available. The kit offers students a rich set of software programs and learning options that are engaging, interactive, and fun. Each program emphasizes different aspects of math, from problem solving to probability, allowing students more participation than ever in a math class.

The National Council of Teachers of Mathematics has been looking for innovative methods to teach new priorities in math. In the Math Kit, you'll discover some of those new methods. The software and curriculum materials were specifically chosen to fill the gap in accessible math software for grades 5-8. Each program supports the standards set by the NCTM.

The Math: Grades 5-8 Kit--the perfect complement for computers in the math class.

s
More Choices, More Flexibility

=====

Now, when you order a Macintosh computer with the Teacher Solution Kit, you may also order two other Apple Education Series kits.

It's as easy as 1-2-3.

1. Select a computer. Order the featured solution--which includes a Power

Macintosh 5260/120 and the kit--or choose one of the other computers listed below and order the computer and kit separately. Refer to the computer data sheets for more details. Refer to the computer data sheets for more details.

2. Choose two other kits. If you wish to order additional Apple Education Series kits, you can find out what's available on the Education Price List and review the contents on their respective data sheets.

3. Purchase everything at once. The Macintosh computer and up to three kits must all appear on the same purchase order.

Computer Options

=====

Power Macintosh 5260/120 (featured computer)

Equipped with 16 MB of RAM, built-in 14-inch color display, 1.2 GB hard disk drive, 8x-speed CD-ROM drive, stereo speakers and microphone, AppleDesign Keyboard, and mouse.

Power Macintosh 5400/180

Equipped with 16 MB of RAM, built-in tilt-and-swivel 15-inch color multiple-scan display, 1.2 GB hard disk drive, 8x-speed CD-ROM drive, Ethernet networking, video-input/output, stereo speakers and microphone, AppleDesign Keyboard, and mouse; includes a PCI expansion slot.

Power Macintosh 6400/200

Equipped with 16 MB of RAM, 256K level 2 cache, 2.4 GB hard disk drive, 8x-speed CD-ROM drive, Ethernet networking, microphone, AppleDesign Keyboard, and mouse; includes two 7-inch PCI expansion slots; supports 16-bit color for display of up to 32,768 colors on a variety of monitors. (Monitor is sold separately.)

Math: Grades 5-8 Kit

=====

* Building Perspective from Sunburst Communications, Inc.

A challenging activity of spatial perception in which students examine buildings of different heights viewed from the side. Then they must determine the top view of an entire block of buildings based on their ground-level observations.

* Divide and Conquer from Sunburst Communications, Inc.

A code-breaking activity in which letters stand for the numbers 0-9. The computer calculates the quotient and remainder, but the answers are in code and the students must crack the code. Students must find clues in patterns, form hypotheses, reason logically, and exchange opinions about numerical relationships, place-value notations, and unknowns.

* Measurement in Motion from Learning in Motion

Students investigate relationships between points, lines, angles, areas, and time. Using QuickTime technology and easy-to-use measurement tools, they can analyze movies of their own or use the ones that are included. Students create points, lines, angles, areas, and numerical data on each changing frame of the movie display. Students can display information in numeric tables, line graphs,

bar charts, histograms, or scatter plots.

* Probability Constructor from LOGAL

Students perform many different probability experiments by working with six familiar models instead of relying solely on abstract numbers and symbols.

By controlling and observing colorful animations, students experiment with the laws of probability, choosing marbles from a jar, tossing coins, rolling dice, spinning color wheels, generating random digits, and using an area model. The results of each experiment are then translated to graphs, tables, or Venn-like diagrams for easy analysis. By analyzing the data, students learn about probability concepts such as the difference between experimental and theoretical probability, relationships between frequency and outcome of events, and the law of large numbers.

* TesselMania! from MECC

A creative tool that reveals the important connections between math and the graphic arts. Students use this program to generate their own tessellations, explore transformational geometry, and examine pattern symmetry. The program's special tools allow students to add color, letters, numbers, and facial features and even animate the construction of their designs. The result is a greater appreciation for math's role in the arts—and some M.C. Escher-inspired art to hang on the refrigerator at home.

* ClarisWorks from Claris Corporation

An award-winning product that combines word processing, database, spreadsheet, graphics, presentation, and communications software in one familiar, efficient environment. With 25 drawing and painting tools, 12 types of charts, and 100 built-in calculations, students can easily create memos, lab reports, news-letters, room layouts, charts, graphs, and reports.

Apple Media Tool: Creating X-platform QTVR movies (10/96)

Revised: 10/31/96
Security: Everyone

Apple Media Tool: Creating X-platform QTVR movies (10/96)

=====

Article Created: 30 October 1996

TOPIC -----

When I try using the Apple Media Tool Converter v2.0 on my QuickTime VR movie, I get an error message that reads "not a cross-platform panoramic movie! Use QuickTime VR Utilities to convert it." Where can I find QuickTime VR Utilities?

DISCUSSION -----

The error message you are seeing is the result of using the wrong type of tool to convert a QuickTime VR (QTVR) movie. The addendum which came with Apple Media Tool 2.0 recommends using the Apple Media Tool Converter, however it is incorrect. You cannot use Apple Media Tool Converter v2.0 to convert QuickTime VR movies. In fact, if you try checking your already-flattened QTVR movie with the converter, you will get the same error.

How to Convert QuickTime VR Movies

=====

Step 1

Launch QTVR Player.

The QTVR Player come with the QuickTime VR Authoring Tools, which is on QuickTime VR Tools CD.

Step 2

Open your QuickTime VR movie.

Step 3

Choose Save As... from the File menu.

Step 4

Check Make Movie Self-Contained and Playable on non-Apple computers options.

Step 5

Type in a name for the new cross-platform QTVR movie.

Step 6

Select the OK button.

You now have a cross-platform QTVR movie.

Total Recall Corporation (10/96)

Revised: 10/31/96
Security: Everyone

Total Recall Corporation (10/96)

=====

Article Created: 31 October 1996

Total Recall

2462 Waynoka Rd.
Colorado Springs, CO 80915

Phone: (800) 743-0594
(719) 380-1616

FAX: (719) 380-7022

WWW Address: <http://www.recallusa.com>

Company Profile:

Total Recall, the former makers of Data Recovery Toolkit, are now using a different approach to data recovery. Users now need to connect to Total Recall's web site and download the Disk Recover software (which fits on a single floppy) and run it on their hard drive. The program recovers what it can and then you must call Total Recall for a "key" to unlock the recovered data. The charge is based on the amount of data that the program can recover, and the size of the hard drive. If the Disk Recover program cannot recover anything, you can send your hard drive to Total Recall for professional data recovery.

Dispatcher Software: Type 11 Error with HP DeskWriter (3/97)

Revised: 3/10/97
Security: Everyone

Dispatcher Software: Type 11 Error with HP DeskWriter (3/97)

=====

Article Created: 10 October 1996
Article Reviewed/Updated: 10 March 1997

TOPIC -----

When trying to print a scanned image from the Color OneScanner Dispatcher software v1.0, 1.2, or 2.0, to a Hewlett-Packard DeskWriter, the Dispatcher software crashes. The error is usually a Type 11 error.

DISCUSSION -----

Service & Support Engineering has been able to reproduce the issue consistently. Hewlett-Packard is aware of the situation.

Updated software that remedies this behavior has been posted by Hewlett-Packard to their World Wide Web site. The updated software for the DeskJet 800 family of printers is version 9.3. For the DeskWriter 600 family, the updated software is version 9.2.1.

As a workaround, you can print from an application other than Dispatcher.

Font Extension 3 Version 1.0.4 Information: Read Me (11/96)

=====

Article Created: 1 November 1996

TOPIC -----

This article is the Font Extension 3 Version 1.0.4 Information Read Me file.

DISCUSSION -----

Font Extension 3 version 1.0.4 fixes a hang (infinite loop) in Japanese Language Kit (JLK) 1.2 when using Adobe Acrobat. This problem was found testing System 7.5.2 on the PowerBook 190. Font Extension 3 version 1.0.3 was made with this fix to ship with the PowerBook 190. 1.0.3 was a 68K only version. Font Extension was later rebuilt as a Fat binary extension to work on both 68K and PowerPC based machines. Apple recommends JLK users upgrade Font Extension 3 to version 1.0.4.

Macintosh Performa: Can't Choose Partition to Restore (12/96)

Revised: 12/19/96
Security: Everyone

Macintosh Performa: Can't Choose Partition to Restore (12/96)

=====

Article Created: 1 November 1996
Article Reviewed/Updated: 19 December 1996

TOPIC -----

Using Drive Setup, I have partitioned the hard drive in my Macintosh Performa 6400 computer. I want to be able to choose which partition I want to restore the system software and applications from the Macintosh Performa system CD-ROM disc. However, the Restore All Software and Restore System Software applications do not allow me to specify which volume to restore to nor do they identify which volume will be used. How can I control which hard disk the Restore applications will use?

DISCUSSION -----

At this time, the Performa Restore application does not permit you to choose the volume on which to restore the System Software or All Software. The restoration application defaults to the internal hard disk and then to the first created partition on this disk.

However, there are two different methods you can use if you have to restore to a volume other than the internal hard drive's first partition.

* You can manually drag the necessary software from the "Hard Disk Files" folder on the Performa CD-ROM disc to the preferred volume.

* Once you start-up using the Performa CD-ROM disc, each of the hard disk volumes will appear on the desktop. Simply drag each volume, except the one you wish to restore to, into the Trash. If the volumes are not mounted, the Restore applications will not see them, and will not try to restore to them.

Note that if you subsequently run Disk First Aid or Drive Setup, the volumes may get mounted.

At Ease Admin: User Info Could Not Be Authenticated (10/96)

=====

Article Created: 2 November 1996

TOPIC -----

When I launch the At Ease Administration application, I get an error that says "Can't access the server because the user information could not be authenticated." What user information does this refer to? How can I fix it?

DISCUSSION -----

The user information being referred to is the name and password you are entering. The error message is informing you that you do not have privileges which can be proven. Make sure you are entering your AppleShare user name and password exactly as it was set up with the AppleShare Admin application on the server. Also make sure your user's login is enabled with AppleShare Admin.

This error can be recreated by just entering the wrong name and password when trying to configure the At Ease server for the first time.

WEB (http and WWW) Servers for the Mac OS (10/96)

Revised: 11/5/96
Security: Everyone

WEB (http and WWW) Servers for the Mac OS (10/96)

=====

Article Created: 2 November 1996

TOPIC -----

This article provides a partial list of third-party software which provides WEB servers for the Mac OS. This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

DISCUSSION -----

WEB (http and WWW) Servers for the Apple Macintosh

Web*Star 1.3.1

From StarNine/QuarterDeck
<http://www.starnine.com/>

WebSTAR helps you publish hypertext documents to millions of Web users around the world, right from your Macintosh. You can also use WebSTAR to put any Macintosh file on the Web, including GIF and JPEG images, Shockwave movies, QuickTime VR, and Java applets. And yet, using WebSTAR is as easy as double-clicking. Plus, it's faster than many Web servers running on UNIX.

Currently Bundled on Apple Internet Server Solutions for the WWW.

NetPresenz 4.0.1

From Peter Lewis, Stairways Software
<http://www.share.com/peterlewis/>

NetPresenz allows your Macintosh to become an FTP, WWW, or Gopher server so that other people can get information from your Mac over the Internet. It honors the Users & Groups privileges and passwords and supports multiple logins, anonymous FTP (user name "anonymous" or "ftp"), full CGI support, MacBinary and BinHex

transfers and much more. It runs either as a background only application or as a normal application displaying the log file.

MacHTTP 2.2.2

From Chuck Shotton

<http://www.biap.com/>

<http://www.starnine.com/>

MacHTTP is a shareware product, and is best used for small or internal web sites. It is the most widely-used desktop Web server on the Internet.

WebSTAR and StarNine - The commercial version of MacHTTP has become StarNine's new WebSTAR product. For more details on WebSTAR, upgrades from MacHTTP, etc., check StarNine Technology's home page.

Boulevard 1.0b21

<http://www.resnova.com/boulevard/>

Boulevard for MacOS is a high performance, full featured web server, designed to host professional web sites. The Boulevard interface is rich, elegant, and easy to use. Boulevard supports CGIs, ACGIs, and W*API plug-ins. The server has built-in support for many functions that are traditionally handled by CGIs, making Boulevard a faster and more economical choice than other Macintosh web servers.

RushHour

<http://www.maxum.com/>

RushHour is the Macintosh Web server optimized for what is probably the vast majority of your server volume - Graphics. Your full-featured Web server, like StarNine's WebSTAR, handles all sorts of files under virtually any conditions, but most of the overhead involved in doing so is unnecessary for most files. RushHour cuts out the overhead and adds a high-performance RAM cache to serve your GIF, JPEG, and other large binary data with extreme speed.

Sonic Servers

<http://www.sonicsys.com/>

Sonic Internet Servers are a group of high performance software Internet Servers which make it easy and economical for businesses to establish a presence on the Internet as well as providing Intranet solutions for intra-office communications. This group of highly integrated Internet Servers includes Web, E-mail, FTP, DNS and DHCP. These servers run on any Macintosh computer and offer easy set-up and maintenance.

All Sonic Internet Servers can be configured and managed via InterManage, Sonic's common management interface application which is included with the Internet Servers. InterManage can access each Internet Server over the LAN or through the Internet, giving the network manager the flexibility to perform

configuration and maintenance from anywhere in the world!

Web for One

<http://www.resnova.com/>

Web for One(TM) is a personal web server designed to let every MacOS computer on a TCP/IP network publish documents on the Internet or LAN. For small business and home users with continuous Internet connections, this provides an easy and inexpensive way to establish a presence on the Internet.

Web for One is a full featured web server, optimized to run in the background using very little memory. The web server supports CGIs, ACGIs, and has built-in support for image maps, server-side includes, server push, directory browsing and automatic form processing. By integrating these features with the server, users can create dynamic, interactive web pages without using expensive and cumbersome CGIs.

WebCenter

From Chris Hawk)

<http://www.slaphappy.com/>

WebCenter is a high-performance web server for the Macintosh and Macintosh compatibles. It offers a wide range of features, making it suitable for virtually any Macintosh-based web site with features like: Multi-threading for fast connection handling, Full CGI compatibility with other MacOS web servers, Server Side Includes to create dynamic web pages, Memory-based file caching for fast file access, Customizable through AppleScript-ability and attach-ability Password-based file access through server realms, Allow or deny clients based on their network address, Power Mac native for quick performance, Open Transport native for maximum performance.

Distributed as freeware. No other MacOS web server has WebCenter's breadth of features. WebCenter is capable of handling tens of thousands of hits per day, enabling it service even the busiest of Macintosh-based web sites.

FireSite v1.0.2

<http://www.clearway.com/>

FireSite gives you fast, interactive Web serving power at an affordable price. Before ClearWay created FireSite, running a Web server had to be expensive and complicated. FireSite cuts through the cost and complications, and makes your own interactive Web server an affordable reality. With FireSite, all you need to connect your own Web server to the Internet is a simple 28.8K modem and a regular phone line. FireSite automatically uses your Internet Service Provider as a lightning-fast 'graphics cache', and accelerates your Web site far beyond the speed limits of your modem!

Common Lisp Hypermedia Server (CL-HTTP)

<http://www.ai.mit.edu/projects/iiip/doc/cl-http/home-page.html>

CL-HTTP is a full-featured server for the Internet Hypertext Transfer Protocol (HTTP 1.1, HTML 2.0, & pre-HTML 3.0) that comes complete with source code.

A World-Wide Web (WWW) server was implemented in Common LISP in order to facilitate exploratory programming in the interactive hypermedia domain and to provide access to complex research programs, particularly artificial intelligence systems. The server was initially used to provide interfaces for document retrieval and for email servers. More advanced applications include interfaces to systems for inductive rule learning and natural-language question answering.

InterServer Publisher 1.2.1

<http://www.intercon.com/products/interserverp.html>

InterCon's InterServer Publisher* answers the increasing demand for distributing information electronically. As the industry's first integrated Macintosh-based Internet server package, InterServer Publisher allows you to create a highly interactive Web, FTP (File Transfer Protocol), and Gopher server presence on the Internet in a matter of minutes.

NetWings HTTP Server

http://netwings.com/nw_home_pages/prod_info.html

Our NetWings and those Macs can get you and your students surfing and serving the Internet now. If you've got one Mac, or twenty. NetWings can let you serve and surf over any type of internet connection. It's software only, you don't need a router and it works on a LocalTalk or EtherTalk LAN. It caches pages. It has site blocking. It does web, ftp, gopher, email, and much more.

Web Server 4D

<http://www.mdg.com/>

Web Server 4D is a fast web server and a very fast relational database in one. This provides unparalleled site tracking without sacrificing performance. In fact, the author of Web Server Construction Kit For Macintosh (Hayden Books), Stewart Buskirk wrote in the comparisons of various packages that, "Web Server 4D is wicked fast!"

Web Server 4D can track new vs. repeat users, serves different pages based on domain, IP or browser, serves files from memory not slow disks, supports clickable maps, Guest Books, form to Email, inserts page counts, odometer page counts, current date, current time all without using CGI - although WS4D is compatible with CGI! Security for any file/folder is available with users and groups support (and tracking history for each realm, user and group!). Supports multiple hosts from one server. Other web servers cannot compare to the standard built-in features of WS4D. Developer edition includes open 4D source code which allows complete customization or integration with existing databases.

Apple Quality Bundles: CDs Labeled for Windows (12/96)

Revised: 12/11/96
Security: Everyone

Apple Quality Bundles: CDs Labeled for Windows (12/96)

=====

Article Created: 4 November 1996
Article Reviewed/Updated: 11 December 1996

TOPIC -----

I have the Early Learning Kit, which is one of the Apple Quality Bundles, and I noticed that some of the CD-ROM discs are labeled as Windows, Windows 3.1 and Windows 95 compatible. Are these discs mislabeled or are they supposed to also work on a PC running Windows or Windows 95?

DISCUSSION -----

The Early Learning Kit includes the following CD titles:

- Playskool Puzzles by Hasbro Interactive
- Sesame Street, Let's Make a Word by Creative Wonders
- How Many Bugs in a Box? by Simon & Schuster
- Millie's Math House by Edmark
- FisherPrice Sing-Alongs by Davidson
- Putt-Putt Saves the Zoo by Humongous Entertainment
- Jump Start Kindergarten by Knowledge Adventure
- Kids Art Center by Creative Wonders

With the exception of "Jump Start Kindergarten by Knowledge Adventure", all of the above CD's are labeled as Windows, Windows 3.1 or Windows 95 compatible on the silk screen of the CD. This is incorrect as none of these CD's labeled as Windows, Windows 3.1 or Windows 95 compatible will actually run on a PC running these operating systems. This was an error during the manufacturing process of these titles. All of the titles in this bundle were developed to run under the Macintosh System Software 7.5.3 or later only. The minimum system recommendations that appear on the box are as follows:

- A PowerPC processor-based Apple Macintosh
- 5 megabytes of RAM available for running the applications
- Macintosh operating system software version 7.5.3 or later
- A double-speed CD-ROM drive
- A 13-inch monitor that can display 256 colors at 640x480 DPI resolution

Apple Printers: Which Support 2-Byte Printing? (11/96)

Revised: 11/4/96
Security: Everyone

Apple Printers: Which Support 2-Byte Printing? (11/96)

=====

Article Created: 4 November 1996

TOPIC -----

Which Apple printers (both LaserWriter and StyleWriter models) are able to print Japanese characters?

DISCUSSION -----

You can print Japanese Characters (Kanji) or any other 2-byte characters to ALL Apple Printers (both QuickDraw and PostScript), provided you are using 2-byte TrueType fonts. However, if you are using 2-byte PostScript Type 1 outline fonts, then you need to use a PostScript printer specifically localized for that language. The following Apple printers were specifically designed to print Kanji characters:

LaserWriter IINTX-J
LaserWriter Select 610 (360-J)
LaserWriter Pro 400
LaserWriter Pro 405
LaserWriter 16/600-J
LaserWriter 12/600-J

For additional information about printing Kanji characters, use the search string "kanji and printing" to locate the following articles in the Tech Info Library:

- Printing Kanji Characters
- LaserWriters: Printing 2-byte Languages/Characters

Performa 6400: Demo Runs Automatically After Restore (11/96)

=====

Article Created: 5 November 1996

TOPIC -----

After restoring all the software on my Macintosh Performa 6400 series computer, the screen flashes while the desktop is appearing. Then, the Performa demo starts running automatically. How can I stop this?

DISCUSSION -----

The Restore All Software function on the Performa CD-ROM disc installs a Performa demo that automatically launches on startup. Before the demo launches, a script runs to verify that the display resolution is set to 640x480. This causes the flashing that you see as the desktop appears.

If, after restoring all software, you would like to stop the Performa Demo from automatically launching, remove the Launch Performa Demo or Launch Welcome Sequence files located in the Startup Items folder in the System Folder on the Hard Drive.

PowerPC Interrupt Extension: Read Me (2/97)

Revised: 2/6/97
Security: Everyone

PowerPC Interrupt Extension: Read Me (2/97)

=====
Article Created: 6 November 1996
Article Reviewed/Updated: 06 February 1997

TOPIC -----

This article contains the ReadMe file for the PowerPC Interrupt Extension.

DISCUSSION -----

Where Can I Find the Extension online?

=====

* America Online - keyword: applecomputer

* CompuServe - GO APLSUP

* Internet (specific location)

ftp://ftp.info.apple.com/Apple_Support_Area/Apple_SW_Updates/US/Macintosh/System/Other_System/PowerPC_Interrupt_Extension.sea.hqx

Overview and Installation

=====

* What is the PowerPC Interrupt Extension?

This system extension may improve reliability and performance on Power Macintosh computers, PowerPC-based Performa computers, Mac OS-compatible computers, and on desktop computers upgraded with a PowerPC upgrade card. This extension requires System 7.5.5.

* Who should install the PowerPC Interrupt Extension?

Apple recommends installing the PowerPC Interrupt Extension for all customers who have installed System 7.5.5 Update on a desktop Power Macintosh,

PowerPC-based Performa, Mac OS-compatible, or on a desktop computer with with a PowerPC upgrade card.

* What does installing the PowerPC Interrupt Extension do?

After installing the PowerPC Interrupt Extension, you may notice improvements in reliability and stability. You may have experienced your computer freezing for several seconds before returning to normal operation, or completely freezing and requiring a restart. This extension fixes one source of this problem.

* I have a PowerBook with a PowerPC upgrade card. Should I install the PowerPC Interrupt Extension?

PowerBooks, both with and without the PowerPC upgrade card, do not experience the problems resolved by the PowerPC Interrupt Extension. Therefore, it is unnecessary for customers with these computers to install the extension.

* I have a PowerPC-based PowerBook**. Should I install the PowerPC Interrupt Extension?

PowerBooks do not experience the problems resolved by the PowerPC Interrupt Extension. Therefore, it is unnecessary for customers with these computers to install the extension.

** The following computers are in the PowerPC-based PowerBook computer family: PowerBook 5300, 5300c, 5300ce, 5300cs, 2300c, 1400c, and 1400cs. Additionally PowerBook 200 and 500 series computers which have PowerPC upgrade cards installed are included in the PowerPC-based PowerBook computer family.

* I have a Macintosh based on the 680x0 processor. Should I install the PowerPC Interrupt Extension?

Macintosh computers with a 68000, 68020, 68030, or 68040 processor do not experience the problem fixed by the PowerPC Interrupt Extension. Therefore, it is unnecessary for customers with these computers to install the extension.

* How do I get System 7.5.5 Update?

To use the PowerPC Interrupt Extension, you must have System 7.5.5 Update installed. You can download the PowerPC Interrupt Extension and System 7.5.5 Update from the Internet at <http://www.support.apple.com/> as well as through America Online (keyword: applecomputer) and CompuServe (shortcut: GO APLSUP). You can also order the System 7.5.5 update for \$13 by calling the Apple Order Center at 1-800-293-6617 ext.1322.

* Once I install the PowerPC Interrupt Extension, do I need to do anything else?

No. The PowerPC Interrupt Extension works automatically once you install it according to the installation instructions.

* How do I install the PowerPC Interrupt Extension?

To install this extension follow these steps:

1. Locate the System Folder icon on your computer's hard disk.
2. Drag the PowerPC Interrupt Extension icon onto the System Folder icon.
3. Click on the OK button when you see the message "Extensions need to be stored in the Extensions folder in order to be available to the Macintosh. Put 'PowerPC Interrupt Extension' into the Extensions folder?"
4. Select Restart from the Special menu for the changes to take effect.

* How do I disable the PowerPC Interrupt Extension?

To disable this extension follow these steps:

1. Select Control Panels from the Apple Menu.
2. Locate the Extensions Manager icon and double click it.
3. Scroll through the list until you see PowerPC Interrupt Extension.
4. Click on the PowerPC Interrupt Extension name so that the check mark beside it disappears.
5. Select Restart from the Special menu.

Technical Details

=====

The following is provided for application developers and others who are interested in the technical details of the PowerPC Interrupt Extension. You do not need to understand the following information to use the extension.

The PowerPC Interrupt Extension applies a fix to the low level interrupt services on desktop PowerPC-based Macintosh, Performa, and Mac OS-compatible computers, and on desktop computers upgraded with a PowerPC. Before this fix, a condition could exist where no interrupt was pending but the computer would wait for an interrupt. In this condition the computer would ignore all lower priority interrupts and no processing would continue until a higher or equal priority interrupt occurred. In some cases this would cause intermittent, long interrupt latencies. In other cases this could cause the computer to freeze.

One condition which creates the problem is when a completion routine or interrupt task lowers the current interrupt mask value during its execution.

..TIL20621-PowerPC_Interrupt_Extension-Read_Me_2-97_(TA36190).pdf

Installing the PowerPC Interrupt Extension applies a fix which will prevent this from causing a freeze or long interrupt latency.

Article Change History:

06 Feb 1997 - Added online locations to download file.

20 Jan 1997 - Added details about which PowerBooks are PPC-based.

Cyberdog 1.1, OpenDoc 1.1, and Macintosh SE/30 (10/96)

Revised: 11/7/96
Security: Everyone

Cyberdog 1.1, OpenDoc 1.1, and Macintosh SE/30 (10/96)

=====

Article Created: 7 November 1996

TOPIC -----

I'm trying to install System 7.5.5, OpenDoc 1.1, and Cyberdog 1.1 on a Macintosh SE/30. The SE/30 freezes when I try installing OpenDoc and Cyberdog.

I've tried performing a clean system install. Stated the SE/30 with only Apple extensions with the addition of Mode 32. I have also tried starting with no SCSI devices, rebuilt the desktop, reset PRAM, start with all extensions off. Is there a known issue I do not know about?

DISCUSSION -----

The first 680x0-based version of Cyberdog is 1.1 which also requires OpenDoc 1.1. OpenDoc 1.1 requires 32-bit ROMs in the computer. Therefore the OpenDoc 1.1 installer does not work on Macintosh II, IIX, IICX, and SE/30 computers. Specifically, the OpenDoc 1.1 installer fails with this error, "Illegal instruction, Co-processor not installed."

Engineering is aware of this issue. They have no time frame for a solution, and there are no workarounds.

Easy Install of 7.5.3 Does Not Install TokenRing Drivers (11/96)

Revised: 11/7/96
Security: Everyone

Easy Install of 7.5.3 Does Not Install TokenRing Drivers (11/96)

=====

Article Created: 7 November 1996

TOPIC -----

I cannot seem to get the System 7.5.3 Installer to "Easy install" the TokenRing drivers on my PowerBook (Duo) 280c. I am running the installer when the PowerBook is docked into a docking station which has a Token Ring card installed. It is as if the TokenRing card is not being recognized by the installer.

I tried doing a "clean install" of System 7.5.3 from the 7.5.3 CD-ROM disc, but still no TokenRing drivers were installed. Why is this happening?

DISCUSSION -----

This situation you encountered appears to be, from our testing results, an issue with the installer, not with your hardware. This situation occurs in all Macintosh models that have TokenRing cards installed, not just the PowerBook Duo in a docking station.

The "Easy Install" option of System Software 7.5.3 CD-ROM disc does not properly detect the presence of an Apple TokenRing card, hence does not install the necessary drivers. You must select "Custom Install" and then "Networking" and "TokenTalk" to get the drivers installed.

At Ease for Workgroups 4.0 and Printer Quota Settings (10/96)

Revised: 11/11/96
Security: Everyone

At Ease for Workgroups 4.0 and Printer Quota Settings (10/96)

=====

Article Created: 8 November 1996

TOPIC -----

This article describes an issue with Printer Quota Settings and Current Chooser Selection in At Ease for Workgroups 4.0.

DISCUSSION -----

At Ease for Workgroups 4.0 documentation, page 2-149 of the Apple Network Administrator Toolkit (ANAT) manual states, "The printer quotas feature only works with desktop printers. It does not work if a Workgroup's users are printing on the current Chooser selection, even if the current Chooser selection is a desktop printer."

When you open the Access to Printers window and highlight the Current Chooser Selection, the Printer Setting button is dimmed. However, if you double click the Current Chooser Selection, a Quota Window for the Current Chooser Selection opens and leaves you with the impression that the option will work for the Current Chooser Selection, but it will not.

The information in the manual is correct, printer quotas will not work with the current chooser selection.

This issue has been reported to engineering, there is no time frame for a solution.

Performa & Power Macintosh 5400 & 6400: Slow Printing (2/97)

Revised: 2/28/97
Security: Everyone

Performa & Power Macintosh 5400 & 6400: Slow Printing (2/97)

Article Created: 7 November 1996
Article Reviewed/Updated: 28 February 1997

TOPIC -----

My Power Macintosh 5400/120 prints very slowly to a LaserWriter over LocalTalk. When I try printing any document, it takes an extremely long time to print. In some cases, printing takes several hours. However, printing over Ethernet works fine.

What could be causing this?

DISCUSSION -----

Apple Computer, Inc. has received reports of extremely slow printing over LocalTalk from some Macintosh Performa and Power Macintosh 5400 and 6400 series computers. Apple has isolated the cause to specific printing devices on specific configurations noted below.

Description of Issue

The slow printing symptom appears to be caused by specific situations, including:

- When some devices send a CTS (Clear To Send) signal too quickly in response to the computers' RTS (Request To Send). The LaserWriter 16/600 w/1.0 IOP ROMs is an example of this situation.
- When virtual memory is turned on. However, with virtual memory turned off, the printer prints in an acceptable amount of time.

Affected Computers

Any 200 MHz or slower Macintosh Performa or Power Macintosh 5400 and 6400 series computer without L2 cache installed may experience these symptoms.

Affected Printers

- Apple LaserWriter IINT
- Apple LaserWriter 16/600 PS with 1.0 ROMs
- Some GCC BLP class printers

Solutions

• Apple is currently looking into a solution to these issues. In the interim, Apple suggests the following workarounds:

- Add L2 cache (Apple part number: M4505LL/A)
 - Turn off virtual memory (add additional physical RAM if additional memory is needed)
 - Upgrade network from LocalTalk to Ethernet
- If you are printing to a LaserWriter 16/600 PS printer, verify the version of the IOP ROM. The ROM version is written on the printer's startup page in the small print on the left side of the page. If the IOP ROM version is 1.0, contact an Apple-authorized service provider for information about upgrading the printer ROM.

Open Transport/PPP 1.0: Read Me (11/96)

Revised: 1/21/97
Security: Everyone

Open Transport/PPP 1.0: Read Me (11/96)

Article Created: 11 November 1996

TOPIC -----

This article is the Open Transport/PPP 1.0 ReadMe Before Installing file.

DISCUSSION -----

Introduction

This document contains the late-breaking information about Open Transport/PPP. For instructions about how to use Open Transport/PPP—including the Modem and PPP control panels—see the Open Transport/PPP User's Manual. Onscreen help is also available in Macintosh Guide. Choose Macintosh Guide from the Help menu (the question-mark icon in the upper-right corner of your screen). Information about Open Transport/PPP appears in the Telecommunications topic area. Or you can click the question-mark icon that appears in the Modem and PPP control panels.

Additional information about Open Transport/PPP is also available on the Open Transport/PPP home page:

<http://devworld.apple.com/dev/opentransport/ppp.html>

Included on this home page is a log of the release notes that describes the changes in each of the successive beta releases of the Open Transport/PPP software.

License Agreement

This release of Open Transport/PPP is subject to the terms and conditions of the License Agreement that accompanies the software in the file License. By using the software you agree to abide by the terms and conditions of the License Agreement.

System Requirements

Open Transport/PPP is designed to work on Mac OS-compatible computers with a Motorola 68030- or 68040-family microprocessor, or a PowerPC 601, 603e, 604, or 604e microprocessor.

The recommended system software version for Open Transport/PPP is 7.5.3 or later, updated with Open Transport 1.1.1. System software versions 7.1, 7.1.1, and 7.1.2 releases are also compatible with Open Transport/PPP updated with Open Transport 1.1.1.

IMPORTANT: You must update your system with Open Transport 1.1.1 before installing Open Transport/PPP. See the following section for information about updating to Open Transport 1.1.1.

NOTE: Open Transport/PPP cannot be used with system software versions 7.5, 7.5.1, or 7.5.2. Before installing Open Transport/PPP on one of these systems, run the latest 7.5.3 (or later) system updater.

Open Transport/PPP 1.0 requires a minimum of 500K of RAM (for 68030- or 68040-based computers) or 600K of RAM (for PowerPC-based computers). Open Transport/PPP memory requirements are based on the size of total system memory, including virtual memory, minus the size of any RAM disk or disk cache you're using.

Open Transport Requirements

Version 1.1.1 of Open Transport is required for use with Open Transport/PPP.

NOTE: The Open Transport 1.1.1 update, provided with the Open Transport/PPP installer, requires that you already have Open Transport 1.1. installed on your computer.

Here are the steps required to install Open Transport 1.1.1, depending on the system software you have:

- System 7.1.x
 1. Install Open Transport 1.1. (Can be purchased for \$39ERP; part number M4252Z/A.)
 2. Install Open Transport 1.1.1 Update. (Available free online, or can be purchased through February 1, 1997 for \$13. Call 1-800-293-6617 and ask for offer 1407.)
- System 7.5, 7.5.1, or 7.5.2
 1. Install System 7.5, Update 2.0. (Available free online at Apple Software Update sites. See the following section for information on how to find these sites.)
 2. Turn on Open Transport (if it is not already on) by using the Network Software Switcher. The Network Software Selector is located in the Apple Extras Folder.
 3. Install Open Transport 1.1.1 Update. (Available free online, or can be purchased through February 1, 1997 for \$13. Call 1-800-293-6617

and ask for offer 1407.)

- System 7.5.3 or 7.5.5
 1. Install Open Transport 1.1.1 Update. (Available free online, or can be purchased through February 1, 1997 for \$13. Call 1-800-293-6617 and ask for offer 1407.)
- System 7.5.3 if you have performed a custom installation without installing Open Transport
 1. Use the System 7.5.3 or System 7.5.2, Update 2.0 installer to custom-install Open Transport 1.1.
 2. Install Open Transport 1.1.1 Update. (Available free online, or can be purchased through February 1, 1997 for \$13. Call 1-800-293-6617 and ask for offer 1407.)
- System 7.5.5 if you have updated a system on which Open Transport was not installed due to a custom installation.
 1. Reinstall system software using the system software disks that came with your computer.
 2. Based on the version of the system software that came with your computer, use one of the procedures above to install Open Transport 1.1.1.

Apple Software Update Sites

Information about updating Apple software is available online on the World Wide Web and other online servers. On the Web, go to either of the following sites:

<http://www.info.apple.com>
<http://www.support.apple.com>

Both of these sites provide links to the Apple Software Updates page.

These sites also provide links to the Technical Info Library (TIL). By searching for "find apple software updates" in the TIL, you can find Apple Software Updates locations for Internet, America Online, CompuServe and other online services.

Once you reach an Apple Software Updates site, use the following path to locate the Open Transport software:

Apple SW Updates
 US
 Macintosh
 Networking-Communications
 Open Transport

Before You Install Open Transport/PPP 1.0

- Make backup copies of the software and documents on your hard disk (especially your System Folder) before installing this software.

- If you already use SLIP or PPP software to access the Internet, make a note of the configuration information that you entered into your previous SLIP or PPP control panels. Configurations are not automatically converted from third-party SLIP or PPP software.

Known Incompatibilities and Limitations

- Version 1.1.1 of Open Transport is required for use with this release of Open Transport/PPP. You should not attempt to use Open Transport/PPP with Open Transport 1.1.

- ARA 2.x modem CCL scripts can be used with Open Transport/PPP. However, some ARA 2.x scripts do not support modem-based error correction and data compression, so performance may not be optimal. You should try to use one of the modem scripts provided with Open Transport/PPP. If you can't find one that matches your modem, you can modify an existing script to suit your needs.

- If you are using both ARA 2.1 and Open Transport/PPP, be sure to install Open Transport/PPP after ARA 2.1 to get the correct set of modem scripts for both products.

- If you are running Open Transport/PPP on a desktop Macintosh that has sleep capabilities, your Open Transport/PPP connection will not be automatically terminated when you select Sleep from the Special menu, because sleeping desktop computers can continue network activity (unlike PowerBook models). If you don't want to remain connected to your PPP server when you put your desktop system to sleep, disconnect manually using the PPP control panel.

- If you have a copy of Open Transport/PPP older than 1.0f1c2 installed, you must discard your old Open Transport/PPP preferences files. To do so, remove the Remote Access folder from the active Preferences folder. Restart your computer and then use the Modem and PPP control panels to customize your configuration.

- Open Transport/PPP 1.0 has some incompatibilities with the Apple Express Modem. If the Internal Modem choice does not appear in the Modem control panel Port pop-up menu, uncheck the "Use internal modem instead of Modem/Printer port" checkbox in the Express Modem control panel and restart. Then open the Modem control panel again.

- You may experience some difficulty with older programs that do not use Open Transport and try to use the serial port while PPP is active. The workaround is to disconnect PPP using the PPP control panel before starting up the serial application.

- Claris EMailer version 1.1v3 or later is compatible with Open Transport 1.1.1. A problem in the Quit command of earlier versions of Claris EMailer sometimes causes a crash with Open Transport 1.1.1 (with or without Open Transport/PPP). For your convenience, the Claris EMailer version 1.1v3 patcher and Claris EMailer Lite version 1.1v3 patcher have been provided in the Open Transport Extras folder.

- You may experience CD and TV sound problems when you are dialing your Internet service provider from a Performa 6300CD computer. The workaround is to launch Megaphone before trying to connect.
- When entering phone numbers for the Motorola BitSURFR Pro 56K and 64K ISDN terminal adapters, do not use dashes or spaces between the numbers. For example, "555-9999" should be entered as "5559999". Entering spaces or dashes may prevent successful connections with the BitSURFR Pro, particularly when two ISDN channels are used.
- If you use PortShare Pro from Stalker GmbH to set up a virtual modem or virtual printer port, the ports appear as Modem or Printer, respectively, in the Modem control panel. They do not appear as Virtual Modem or Virtual Printer. PortShare Pro replaces the serial drivers for the on-board modem/printer ports with its own, so selecting Modem or Printer causes Open Transport/PPP (and any other native Open Transport serial application) to use the replacement drivers.
- Open Transport/PPP will report the single channel speed of 56Kbps or 64Kbps. The 112Kbps or 128Kbps speeds are used but not displayed when using a second ISDN channel with multilink PPP. Use the terminal adapter to find out the speed of the second channel.

Compatibility with the Apple Internet Connection Kit

You can install both Open Transport/PPP and the Apple Internet Connection Kit (AICK) on your computer at the same time. Both products enable you to dial with your modem and connect to the Internet.

At the time of this release, AICK does not use the Open Transport/PPP software to dial and connect to the Internet. AICK has its own Dialer, which uses MacPPP software to establish the remote connection. MacPPP is a third-party implementation of the Point-to-Point Protocol.

All of the AICK applications, however, are compatible with Open Transport/PPP 1.0. To use Open Transport/PPP with AICK applications, you must configure Open Transport/PPP as described in the Open Transport/PPP User's Manual and in the "Connecting to the Internet" topic area of Macintosh Guide.

The currently active PPP software is selected using the "Connect via" pop-up menu in the TCP/IP control panel. MacPPP is listed as MacPPP. OT/PPP is listed as PPP. MacPPP is controlled by using the ConfigPPP control panel, the Apple Internet Dialer application, or the Apple Internet Status application. Open Transport/PPP is controlled by using the Modem and PPP control panels, which do not modify or change MacPPP configuration information.

If you use both PPP software packages (one at a time), note that launching either the Apple Internet Dialer or Apple Internet Status will make MacPPP active. Furthermore, you will need to switch TCP/IP configurations each time you switch from one PPP software package to the other. (Information about changing TCP/IP configurations appears in the Network topic area of Macintosh Guide.)

Interactions with Third-Party Software

Netscape 2.x will not work reliably with versions of the Mac OS before System 7.5.3 or versions of Open Transport software before 1.1. If you would like to use Netscape 2.0.1 or later, you should make sure that System 7.5.3 or later and Open Transport version 1.1.1 or later are also used. Failure to follow this recommendation may result in system crashes.

Modem Support

Scripts that support many popular modems are provided on the Open Transport/PPP installation disk(s). The scripts include:

3Com Impact Analog 14.4
3Com Impact ISDN 56K
3Com Impact ISDN 56K MLPPP
3Com Impact ISDN 64K
3Com Impact ISDN 64K MLPPP
Apple Personal Modem
AT&T Dataport 288
AT&T KeepInTouch
Best Data Smart One 28.8/33.6
Dayna CommuniCard 28800
Farallon Netopia 56K
Farallon Netopia 56K MLPPP
Farallon Netopia 64K
Farallon Netopia 64K MLPPP
GeoPort/Express Modem

Supra 28.8/33.6

TDK DF2814
Telebit QBlazer
US Robotics Universal
Zoom V-Series

Apple now installs all modem scripts in the Modem Scripts folder (in the Extensions folder) instead of directly in the Extensions folder. Future Apple products will handle modem scripts the same way. Open Transport/PPP does not recognize modem scripts stored outside the Modem Scripts folder.

Auto-routing of modem scripts has been disabled by the installer. Once Open Transport/PPP is installed, a modem script will not be routed to the Extensions folder if it is dragged into an active System folder.

The Easy Install mode of the installer copies all of the Open Transport/PPP modem scripts to your disk. You can choose Custom Install to limit the installation to only the scripts you choose.

NOTE: You can delete any unneeded scripts from the Modem Scripts folder, which is located inside the Extensions Folder. To recognize scripts, look for files labeled as "Modem Link Tool Personal document."

Additional (Unsupported) Modem Scripts

User-contributed scripts are available online. New modems are regularly introduced and Apple is willing to help publish scripts donated by users to aid in making Apple Remote Access and Open Transport/PPP work easily with as many modems as possible.

IMPORTANT: User-contributed scripts are not tested or supported by Apple Computer, Inc., so you should contact the script's author rather than Apple if you run into difficulty using a script downloaded from the unsupported folder. User-contributed modem scripts are provided on an as-is basis as a convenience to Apple customers. They are not warranted to be complete or free from errors, although Apple may choose to review and fully test some user-contributed scripts and include them in future versions of Apple software. If you want to provide Apple with feedback about particular user-contributed scripts, send electronic mail to the following address: msg@apple.com

To find these scripts, go to any Apple Software Updates location and use the following path:

```
Apple SW Updates
  US
    Macintosh
      Unsupported
        CCL
```

If you want to contribute a modem script, please use the following procedure:

1. Download the sample Read Me file from the User-contributed scripts folder. The file is named CCL_README_TEMPLATE.

2. Customize the sample Read Me as appropriate for the script you want to submit.
3. Send electronic mail to msg@apple.com and enclose the script in bin/hex format.

Scripts will only be posted if they are accompanied by a Read Me explaining the script's purpose and how to contact the author.

(See "Apple Software Updates Sites" near the beginning of this Read Me for information on how to find Apple Software Updates locations.)

Modem Cable Requirements

Most modems require a cable that supports the data terminal ready (DTR) signal. In addition, certain modems require a cable that supports CTS/RTS hardware flow control. To support DTR, the cable must connect pin 20 on the DB-25 connector to pin 1 on the Mini DIN-8. To support CTS/RTS, the cable must connect pin 5 on the DB-25 connector to pin 2 on the Mini DIN-8 and pin 4 on the DB-25 connector to pin 1 on the Mini DIN-8. Contact your modem vendor or Apple-authorized dealer to obtain the necessary cable.

Open Transport/PPP and Apple Remote Access Compatibility

Open Transport/PPP and ARA versions 1.0, 2.0, 2.0.1, and 2.1 are fully compatible and can be used on the same system. Only one can be used at a time.

Versions of ARA before 2.1 install modem scripts directly in the Extensions folder. To make sure that these scripts appear as choices in the Modem control panel, move them to the Modem Scripts folder in the Extensions folder.

ARA 2.1 installs its scripts in the Modem Scripts folder with Extensions. If you are using ARA 2.1, you must install Open Transport/PPP after ARA 2.1 to get a set of scripts in the Modem Scripts folder that works optimally with both products. The Open Transport/PPP scripts support certain modem-based features, such as error correction and data compression, that improve PPP performance. The ARA 2.X scripts may not support these features.

Also, some scripts included with ARA 2.1 are no longer installed with Open Transport/PPP. These scripts are left on your disk by the Open Transport/PPP installer. They may be usable with Open Transport/PPP, but have not been tested for compatibility by Apple.

Registered User or Guest?

If your PPP server does not require a user name and password, or if the server requires only that you enter a name and password in a terminal window, you can select the Guest mode button in the PPP control panel. This will hide the Name and Password fields and will cause the Connect button to be enabled as soon as you enter a phone number.

If your server requires a PPP user name and password instead of, or in addition to, a terminal server login, you must use the Registered User mode of the PPP control panel. In this mode, you must enter something in the Name and Number fields to enable the Connect button. If you leave the Password field blank, and "Save password" is not checked, you will be prompted to confirm that you want to connect without a password.

Connect Scripts

The following varStrings have been added to the CCL scripting language for the user name and password:

Name: ^11 or ^U
Password: ^12 or ^P

When the connect script is executed, these varStrings are substituted by the strings stored in the Name and Password fields of the PPP control panel.

When you record a connect script, and you have entered your name and password in the PPP control panel, the connect script that's recorded by the terminal window will replace those strings by the appropriate varStrings.

The ^U and ^P varStrings are provided as mnemonics for the user name and password, but they cannot be used as parameters of some CCL commands like IFSTR. With those commands, use the ^11 and ^12 varStrings instead.

Connection CCL scripts that use the password varString (^12) in WRITE commands do not log the password in clear text. The password is logged as bullets. This is true whether the user records the script or types it in.

More detailed information about the syntax of the CCL language used for both modem scripts and connect scripts is in the ARA Modem Scripting Guide.PDF file in the OT/PPP Extras folder. This file is in Adobe Acrobat format.

Manual Dialing

Procedures for establishing an Open Transport/PPP connection with manual dialing vary according to the type of modem you are using. To ensure that you can make a connection while using manual dialing, you may need to experiment with pressing the Connect button slightly before or after you hear the remote modem answer the phone.

Using an Express Modem or GeoPort Telecom Adapter

If you are using Express Modem software with either an Express Modem or a GeoPort Telecom Adapter, you must turn on 32-bit addressing in the Memory control panel. Using 24-bit addressing may result in incorrect behavior.

Using Global Village PC Card Products

The Global Village software included with your modem adds an entry to the "Connect via" pop-up menu of the Modem control panel called "PowerPort PC Card". Under some circumstances, an entry for the actual slot your PC Card is plugged into will show up as well ("Upper-slot", "Lower-slot"). These slot-specific items should not be used and the "PowerPort PC Card" item should be used instead or the port will be erroneously reported as busy.

Using an ISDN Terminal Adapter

Both Open Transport/PPP and ARA 2.1 support serial connection speeds of 115,200 and 230,400 bps. By doing so, Apple enables Macintosh users to make ARA and PPP connections over ISDN lines at 64 kbps or even 112 kbps if the ISDN terminal adapters at both ends support channel bonding and proper modem scripts are used.

NOTE: The "Connected at" line of the PPP control panel status box may not accurately reflect the connection speed of ISDN connections. A slower speed may be indicated because ISDN terminal adapter hardware does not report the establishment of second channel connections to the CCL script engine. This will usually happen if you use the Multilink PPP (MLPPP) version of an ISDN script.

Connection speeds of 115,200 and 230,400 bps are not supported by the serial ports on most older Macintosh computers. Here is a partial list of Macintosh models that do have fast serial port support:

- Macintosh Centris 660AV, Macintosh Quadra 660AV and Macintosh Quadra 840AV models
- Macintosh Performa 6100CD series
- Power Macintosh 6100, 7100, 7200, 7500, 7600, 8100, 8500, and 9500 models
- Workgroup Server 6150, 7250, 8150, 8550, and 9150 models

To set the built-in serial ports at 115,200 or 230,400 bps, a new serial driver called SerialDMA must be installed to replace the standard Macintosh serial device driver. SerialDMA is provided by Apple, and the current version is 2.0.2. It is highly recommended that the file Serial (Built-in) be installed in the Extensions folder as well on Macintosh models with PCI slots to support these high speeds (38,400 bps and above). System 7.5.3 or later includes the latest version of SerialDMA and the file Serial (Built-in).

NOTE: In general, ISDN terminal adapters have more configuration options than conventional modems. At this time it is not possible for Apple to support all combinations of these options for all the ISDN terminal adapters that are supported. We have attempted to write scripts that work with the most common ISDN configurations. You may have to get a revised script from your Internet service provider or network administrator if your server uses different options. You can also modify a script yourself using the Modem Script Generator or by editing the script text directly.

How to Turn Off or Remove Open Transport/PPP

To disable and remove Open Transport/PPP software by using the Custom Remove option in the Installer, follow these steps:

1. Open the Installer application included with Open Transport/PPP 1.0. The Welcome to the Apple Installer screen appears.
2. Click the Continue button. The Open Transport PPP Installation screen appears
3. Choose Custom Remove from the pop-up menu in the upper-left corner.
4. In the list that appears, select the files you would like to remove by clicking the box next to each file so that an "X" appears in it. To completely remove Open Transport/PPP, you should select all the files listed.
5. Click the Remove button. If a window appears asking you whether to quit any open applications, click Continue. A window will appear telling you to restart your computer.
6. Click the Restart button.
7. Reinstall and configure your previous SLIP/PPP software as required.

To disable Open Transport/PPP without using the Installer, follow these steps:

NOTE: Although the PPP and Modem control panels appear in the Extensions Manager, there is no component in the Extensions Manager that lets you disable Open Transport/PPP. To disable Open Transport/PPP without using the Installer, you must follow the instructions given here.

1. Move the OpenTpt Remote Access, OpenTpt Modem, and OpenTpt Serial Arbitrator shared libraries from the Extensions folder in the active System Folder.
2. Move the PPP Commands file from the Scripting Additions folder in the Extensions folder.
3. Move the PPP and Modem control panels from the Control Panels folder in the active System Folder.
4. Restart your computer.

It is not necessary to move the Modem Scripts folder from the Extensions folder.

Open Transport/PPP 1.0: Troubleshooting (11/96)

Article Created: 11 November 1996

TOPIC -----

This article provides some troubleshooting techniques to common issues.

DISCUSSION -----

Your modem is not listed in the Modem control panel

The modem script for your modem might not be properly installed. Refer to the OT/PPP Read Me file in the Open Transport/PPP folder on your hard disk for the list of modem scripts that came with OT/PPP. Modem scripts should be in the Modem Scripts folder, which is located in the Extensions folder (in your System Folder). If you do not have the script, check with one of the following sources to see if a modem script is available:

- your modem manufacturer's technical support line
- your Apple-authorized dealer
- Apple's World Wide Web site (<http://www.apple.com>)

You are unable to make a call

If you cannot make a call, something may be wrong with your telephone line, your modem, or the modem setup.

- Make sure your modem is connected properly and turned on. Refer to your modem documentation if you have any problems.
- Make sure your modem type and port are correctly selected in the Modem control panel.

You cannot hear the modem working

Most modems have built-in speakers that let you hear that the modem is working. While connecting to a remote server, you can hear the dial tone, the tones of the numbers being dialed, and the sounds of the modems communicating with each

other. After a connection is successfully established, the modem typically turns the speakers off. If you cannot hear these sounds, try the following:

- Make sure that the Sound option in the Modem control panel is set to On.
- If your modem has a volume control, make sure that it is not turned all the way down.

You are unable to connect to a server

If your modem is working but you cannot connect to the server, try the following suggestions, in the order in which they are listed here, until you are able to connect:

- Verify the phone number of the server you are trying to call. Dial the number using a regular telephone and listen for the "whistle" of a modem. Make sure that you are calling a PPP server.
- Make sure you are a registered user on the server or that the server is set up for guest access. If you try to connect as a registered user, check that you have entered your user name and password correctly. Passwords are "case-sensitive"—capitalization matters.
- You may need to create pauses while the telephone number is being dialed. Insert a comma between parts of the number where a pause might be needed. Inserting a second comma lengthens the pause. For example, the following entries cause OT/PPP to dial a "9" to get an outside line, then pause before dialing the rest of the number:
 9, 555-1234
 9,, 555-1234
- Make sure you are using the correct modem script for your modem, and that the script came from Apple or the manufacturer of your modem. To test if the problem is your modem and script, try connecting with a different modem.
- The server you are calling may require that you log in to a command-line host through a terminal window. Try selecting the "Connect to a command-line host" protocol option. (From the PPP control panel, click the Options button, then click the Protocol tab to display the protocol options.)
- The server you are calling lets you connect directly, but you have selected the "Connect to a command-line host" protocol option. Try turning this option off. (From the PPP control panel, click the Options button, then click the Protocol tab to display the protocol options.)
- Try deselecting the "Allow error correction and compression in modem" protocol option. (From the PPP control panel, click the Options button, then click the Protocol tab to display the protocol options.)

You cannot maintain the connection

If you are losing the connection, check the following:

- Servers sometimes develop problems that log users out without explanation. Try calling back later. You might also try a different service provider.
- If you have call waiting, an incoming call can interrupt the connection. In the PPP control panel, precede the phone number with the code to turn

off call waiting. Check with your telephone company to find out the code to use.

- Many servers automatically end a connection if it is inactive for a certain time. Check with your Internet service provider or network administrator.
- Some combinations of modems work better than others. Your modem may not be a good match for the modem of the server you are calling. If possible, try calling an alternate number for the server or using a different modem.
- You may have noisy phone lines. If you can hear a "crackle" during a normal voice call, have your line checked by your phone company.

You are unable to dial manually

If you have trouble using the Dial Manually feature, contact the modem manufacturer to be sure the modem script has been upgraded to support the latest features available with OT/PPP.

OT/PPP connects when you start your Macintosh

If you do not want OT/PPP to connect automatically to the Internet when you start up your computer, make sure the "Load only when needed" checkbox in the TCP/IP Options dialog box has an X in it. You open the TCP/IP Options dialog box by clicking the Options button in the TCP/IP control panel. (If the Options button is not visible, you must set the User Mode to Advanced or Administration. Choose User Mode from the Edit menu to open the User Mode dialog box.)

TCP/IP applications do not start OT/PPP automatically

Be sure that the "Connect automatically when starting TCP/IP applications" option (in the PPP control panel's Connection options) is selected.

Open Transport & Microsoft Exchange: Network Error (11/96)

Revised: 11/11/96
Security: Everyone

Open Transport & Microsoft Exchange: Network Error (11/96)

=====

Article Created: 11 November 1996

TOPIC -----

I'm using Open Transport, with a fixed IP address, on my Macintosh connected with 10 Base-T Ethernet to a Microsoft NT Server running Microsoft Exchange mail server. When I launch Microsoft Exchange, I get the error message, "Network is not available." What is wrong?

DISCUSSION -----

You should not select to have TCP/IP load only when needed. To do this, open the TCP/IP control panel, select User Mode... under the Edit menu and choose either Advanced, or Administration. In the Advanced or Administration user mode you can click Options... and then deselect "Load only when needed" by clicking the checkbox to remove the "X". If no "X" is in the checkbox, this option is not selected.

PlainTalk 1.5: Read Me (1/97)

=====

Article Created: 11 November 1996
Article Reviewed/Updated: 20 January 1997

TOPIC -----

This article contains the ReadMe file for PlainTalk 1.5, which is available from:

http://speech.apple.com/ptk/readme_ptk.html

DISCUSSION -----

About PlainTalk 1.5

=====

PlainTalk is a collection of software that enables your Macintosh to speak written text and respond to spoken commands. PlainTalk 1.5 includes three components, each with its own installer: English Text-to-Speech, Mexican Spanish Text-to-Speech, and English Speech Recognition.

This document describes each of these three software packages, and discusses the differences between PlainTalk 1.5 and earlier versions of PlainTalk.

For more information about Apple Computer's speech software, please visit Apple's Speech web site at <http://www.speech.apple.com/>.

English Text-to-Speech

With the English text-to-speech software installed, many Macintosh programs can read English text out loud. To install the English Text-to-Speech software, you need the following software and hardware:

- * any Macintosh or Power Macintosh computer
- * version 6.0.7 or later of system software
- * at least 300 kilobytes (K) of RAM in addition to what the rest of your system software requires
- * at least 5 megabytes (MB) of space available on your hard disk

On System 7.0 or later (System 7.1 or later if you have a computer with less than a 68020 microprocessor) the Text-to-Speech software includes a Speech control panel. In PlainTalk 1.5 and later, this Speech control panel includes a "Talking Alerts" options panel. If you use this to turn the Talking Alerts feature on, your Macintosh will speak the contents of alerts to you. (An alert appears, for example, when your printer runs out of paper while printing.) For more information about the English Text-to-Speech software, see the Using English Text-to-Speech document in the English Text-to-Speech folder.

Mexican Spanish Text-to-Speech

With the Mexican Spanish text-to-speech software installed, many Macintosh programs can read Spanish text out loud. To install the Mexican Spanish text-to-speech software, you need the following hardware and software:

- * a Power Macintosh computer or a Macintosh computer with a 68020, 68030, or 68040 processor
- * version 7.0 or later of system software
- * at least 1.3 MB of RAM in addition to what the rest of your system software requires
- * at least 2 MB of space available on your hard disk

For more information about the Mexican Spanish Text-to-Speech software, see the Using Mexican Spanish TTS document in the Mexican Spanish Text-to-Speech folder.

English Speech Recognition

With the English Speech Recognition package and the proper hardware, your computer can respond to spoken commands. The English Speech Recognition package includes the Speech Recognition system extension, the Speech control panel, and a utility called Speakable Items. With Speakable Items, whenever you say the name of an item inside the Speakable Items folder (which is inside the Apple Menu Items folder), the computer acts as if you double-clicked the item. You can turn Speakable Items on and off using the Speech control panel. You can also use the Speech control panel to set several preferences for how Macintosh Speech Recognition programs listen and respond. For example, you can set the Listening options in the Speech control panel so that the recognizer only listens while you hold down a key of your choice. When you use this option recognition accuracy is improved and misfires (when the computer thinks you spoke a command but you didn't) are eliminated. To install and use the English Speech Recognition software, including the Speakable Items software, you need the following hardware and software:

- * a Power Macintosh computer
- * system software version 7.5 or later
- * a 16-bit microphone, such as the Apple PlainTalk Microphone or the microphone built into some Apple audiovisual displays.

For more information about the English Speech Recognition software and the Speakable Items utility, see the Using Speech Recognition document in the English Speech Recognition folder. You can also learn more about Apple's speech

software -- and check for updates -- by visiting Apple's Speech web site at <http://www.speech.apple.com/>.

Differences between PlainTalk 1.5 and PlainTalk 1.4.1

PlainTalk 1.5 is a relatively minor update to PlainTalk 1.4.1. It contains a couple new features and a few bug fixes:

* The Speech control panel in PlainTalk 1.5 includes a new feature called Talking Alerts. If you use the Talking Alerts options in the Speech control panel to turn the Talking Alerts feature on, your Macintosh will speak the contents of alerts to you. (An alert appears, for example, when your printer runs out of paper while printing.) The Speech control panel is installed when you run any of the PlainTalk 1.5 installers -- English Text-to-Speech, Mexican Spanish Text-to-Speech, or English Speech Recognition.

* The English Speech Recognition installer for PlainTalk 1.5 installs a version of the Speech Recognition extension (version 1.5.1) that allows Speech Recognition to run on all shipping Power Macintosh computers and PowerPC-based PowerBooks** with 16-bit sound input. Version 1.4.1 of the English Speech Recognition installer installed an older version of the Speech Recognition extension (version 1.4.1) which did not work on some PowerPC-based Performas and PowerBooks that had shipped after PlainTalk 1.4.1 was released. Users of those computers had to separately install an updated Speech Recognition extension (version 1.5). That is no longer necessary.

** The following computers are in the PowerPC-based PowerBook computer family: PowerBook 5300, 5300c, 5300ce, 5300cs, 2300c, 1400c, and 1400cs. Additionally PowerBook 200 and 500 series computers which have PowerPC upgrade cards installed are included in the PowerPC-based PowerBook computer family.

* The Speakable Items utility (which gets installed when you run the English Speech Recognition installer) contains a few new default speakable items, including "Quit Application" and "Zoom Window".

* The Speakable Items utility now accepts numbers in item names. For example, if you make an alias to an application named "Super Application 4.3" and drag the alias to the Speakable Items folder, then you can open that application by saying "Open Super Application four point three", or "Open Super Application four three" or simply "Open Super Application". In earlier versions of the Speakable Items utility, numbers in item names were ignored.

* The "listen only while key(s) are pressed" feature (also known as the push-to-talk feature) in English Speech Recognition is now even more tolerant of noise or speech that occurs before the push-to-talk key is pressed, requiring little or no pause before pressing the key down and speaking a command. Using the push-to-talk feature increases recognition accuracy and eliminates misfires (when the computer misinterprets sounds not intended for the computer).

* The English Speech Recognition installer for PlainTalk 1.5 installs a version of the Speech Recognition extension (version 1.5.1) which has features and bug fixes that help developers create more robust speech recognition applications.

Developers can learn how to use speech recognition in their applications by visiting Apple's Speech web site at <http://www.speech.apple.com/>.

Differences between PlainTalk 1.5 and PlainTalk 1.4

PlainTalk 1.4.1 was a minor update to PlainTalk 1.4. It included a few bug fixes, including the following:

- * Version 1.4.1 and later of the Speech control panel (which is installed by version 1.4.1 and later of English Text-to-Speech, Mexican Spanish Text-to-Speech, and English Speech Recognition) contains a fix to incompatibilities that version 1.4 of the Speech control panel had with HyperCard 2.3's popup menus when running on Power Macintosh computers.

- * Version 1.4 of the Speech control panel failed to run on some 68000 Macintosh computers (including Macintosh SE computers). Version 1.4.1 and later of the Speech control panel runs on all Macintosh computers with system software version 7.1 or later.

Differences between PlainTalk 1.5 and PlainTalk 1.3

Version 1.3 and earlier versions of the PlainTalk software had a single installer program that installed both text-to-speech and speech recognition. PlainTalk 1.4 and later contain three separate installers to make it easier to install just the parts that are appropriate for your needs: English Text-to-Speech, Mexican Spanish Text-to-Speech, and English Speech Recognition. You don't have to install them all.

However, if you are going to install version 1.5 of English Speech Recognition or Mexican Spanish Text-to-Speech then you should first install version 1.5 of English Text-to-Speech, even if you already have an older version of English Text-to-Speech installed. English Speech Recognition version 1.5 is a relatively minor update from versions 1.4 and 1.4.1, as described above. But English Speech Recognition version 1.5 (like versions 1.4 and 1.4.1) has some significant differences from the speech recognition software in version 1.3 and earlier versions of PlainTalk. Some features were eliminated to simplify speech recognition and make it more robust and usable. Other options have been added to increase accuracy and eliminate misfires.

- * Version 1.4 and later offers a new listening option in the Speech control panel, 3Listen only while key(s) are pressed,2 that lets you leave Speakable Items on all the time without worrying about misfires. It also improves the accuracy of recognition.

- * Version 1.4 and later works in a wider range of environments thanks to its improved adaptation to room acoustics.

- * Version 1.4 and later does not include or support Speech Macros, the Speech Macro Editor, or Speech Rules. It still supports speaking dialog buttons and the Speakable Items folder. Any item you place inside the folder becomes speakable<saying the name of the item launches or opens the item. You can use the AppleScript ScriptEditor to create scripts that are launched by speaking a command: just save the scripts inside the Speakable Items folder. To see

examples, look inside the Speakable Items folder.

* Version 1.4 and later runs on Power Macintosh computers only, and does not support Macintosh AV computers with 68040 processors. You can continue to use PlainTalk 1.3 on 68040 Macintosh AV computers.

* Version 1.4 and later does not include automatic support for recognizing the spoken names of menu commands. You can still manipulate scriptable programs, such as the Finder, using AppleScript commands. To see examples, look inside the Speakable Items folder.

Deciding whether to upgrade to version 1.5

(if you are currently running version 1.3 or earlier)

In general, version 1.5 offers a more robust and flexible set of features than version 1.3 or earlier versions. However, some people in special circumstances may do better with version 1.3.

* If you have a Macintosh AV computer that has a 68040 processor and you use PlainTalk 1.3's speech recognition capabilities, Apple recommends that you continue using version 1.3 of the PlainTalk software. Though the new text-to-speech software works with these non-PowerPC-based computers, the new speech recognition software does not (because it runs on Power Macintosh computers only). It is not recommended that you mix versions, using the old recognition software with the new text-to-speech software.

* If you make extensive use of PlainTalk 1.3's Speech Macros, the Speech Macro Editor, or the ability to speak menu commands, then you might want to continue using version 1.3. As part of the effort to make the software more robust, version 1.4 and later of English Speech Recognition supports Apple's standard AppleScript ScriptEditor instead of the Speech Macro Editor, and it does not support the ability to speak menu items.

MAE & UNIX AppleTalk Software May Conflict (11/96)

Revised: 11/13/96
Security: Everyone

MAE & UNIX AppleTalk Software May Conflict (11/96)

=====

Article Created: 13 November 1996

TOPIC -----

Under some circumstances, MAE at startup may report that another host with the same name is already on the network. Changing the host name in the Network control panel does not prevent this message. What is wrong?

DISCUSSION -----

AFP (AppleTalk Filing Protocol) server software for UNIX systems like KAShare, KIP/CAP, Ushare, and so on may be causing what you report. For example, KAShare modifies the UNIX kernel to support AppleTalk, as MAE does, similar AFP UNIX server packages may have conflicts as well.

Apple Network Administrator Toolkit Software License (11/96)

Revised: 11/13/96
Security: Everyone

Apple Network Administrator Toolkit Software License (11/96)

=====

Article Created: 13 November 1996

TOPIC -----

The following information is a part of the documentation that accompanies the product 435036U -- Apple Network Administrator Toolkit. This is the User License information.

For more product information see Tech Info Library article, "Apple Network Administrator Toolkit Specifications."

DISCUSSION -----

Apple Computer, Inc.
Apple Network Administrator Toolkit
10-User Software License Agreement

2. Permitted Uses and Restrictions. The License allow you to install and use the Administration Software on a single Apple-labeled or Apple-licensed computer at a time and the Server Software on a single Apple-labeled or Apple licensed computer at a time. You may also copy and install the Client Software, AppleShare Agent and FirstClass Agent ("Client Software") on up to ten (10) Apple-labeled or Apple-licensed computers owned and/or operated by you by installing the Client Software onto the respective hard disk of each such computer. In addition, you may make one copy of the Apple Software in machine-readable form for backup purposes only.

Summary

- 1 - copy of the Administer software maybe installed.
- 1 - copy of the Server Software maybe installed on only one server at a time.
- 10 - copies of the Client software maybe installed on only 10 CPUs at a time.

IMPORTANT:

Additional copies of the Apple Network Administrator Toolkit manual may be purchased separately. For further information or to place an order, call 800-544-8554.

Clarix offers computer purchasing solutions fro both Clarix and Apple software products. If you have questions about licensing the Apple Network Administrator Toolkit, or other Clarix and Apple Products, please call 800-358-3395.

Revised: 11/14/96
Security: Everyone

PowerBook 1400: SoftWindows 95 Cannot Read CDs (11/95)

=====

Article Created: 14 November 1996

TOPIC -----

I have installed Insignia Solutions SoftWindows '95 on a PowerBook 1400 series computer. Everything seems to function as expected when I am working in SoftWindows '95 except that it does not recognize anything in the CD-ROM drive in the Windows environment.

DISCUSSION -----

SoftWindows '95 needs to be upgraded to version 1.0.2 or later in order to recognize ATAPI interface CD-ROM drives (like the CD-ROM drive in the PowerBook 1400 series computers). A patch to version 1.0.2 can be found on the Insignia Solutions' ftp site: [ftp.insignia.com](ftp://ftp.insignia.com).

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor, Insignia, for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

PowerBook 270c: Cannot Use Apple HD SC Setup 7.3.5 (11/96)

Revised: 11/15/96
Security: Everyone

PowerBook 270c: Cannot Use Apple HD SC Setup 7.3.5 (11/96)

=====

Article Created: 15 November 1996

TOPIC -----

If you try to reformat the 240 MB hard drive that came in the Macintosh PowerBook Duo 270c computers with Apple HD SC Setup 7.3.5 application (which comes System 7.5.3), the formatting process stops at the verification stage when it produces an error that halts the formatting.

DISCUSSION -----

Apple HD SC Setup 7.3.5 cannot format or initialize the 240 MB hard drive that comes with PowerBook 270c computers. You need to use Apple HD SC Setup 7.3.2, which came with System 7.5, or an earlier version.

There are only two features that are included in Apple HD SC Setup 7.3.5, but are not included in version 7.3.2: support for 4 GB hard drives and support for multiple Macintosh volume partitions.

Macintosh Performa 6400: Which Modem is Included? (11/96)

Revised: 11/22/96
Security: Everyone

Macintosh Performa 6400: Which Modem is Included? (11/96)

Article Created: 15 November 1996
Article Reviewed/Updated: 22 November 1996

TOPIC -----

Is there a way to identify which modem--Geoport or Global Village--was included with my Macintosh Performa 6400 series computer?

DISCUSSION -----

In order to identify the type of modem a Macintosh Performa 6400 series computer contains, use any of the following information:

1) Check the last three characters of the serial number and compare it to the information below:

=====+=====+=====+=====			
Computer	Part Number	Last 3 Characters of Serial Number	Modem Included
=====+=====+=====+=====			
Performa 6400/180	M5167LL/A	7U7	Global Village
		95R	Geoport
-----+-----+-----+-----			
Performa 6400/200	M5168LL/A	836	Global Village
		95S	Geoport
-----+-----+-----+-----			

2) Compare the manuals in the "Using Your Modem" package (which was included with your computer) with those described below:

=====+=====+=====+=====

Global Village Modem	Geoport Modem
----------------------	---------------

=====+=====	
Read Me First: About Your Modem	Apple TeleCom Manual
-----+-----	
TelePort Platinum V	Using Your Modem, Fax, Internet,
Telecommunications Card User's Guide	and Other Telecommunications Programs
-----+-----	
Apple Address Book: User's Guide	
-----+-----	
Apple Fax: User's Guide	
-----+-----	

3) Within the Communications module in ClarisWorks, type AT11 and compare the results obtained to the list below:

=====+=====	
Result Codes	Modem Installed
=====+=====	
240	Global Village Platinum 28.8
-----+-----	
0	Apple Geoport 28.8
-----+-----	
255	Global Village 14.4
(should not be included in Macintosh Performa 6400 computers)	
-----+-----

Newton Connection Kit 2.03 for Windows: Read Me File (4/97)

=====

Article Created: 15 November 1996
Article Reviewed/Updated: 28 April 1997

TOPIC -----

This article contains the Newton Connection Kit 2.03 for Windows readme file.

DISCUSSION -----

Welcome to Newton Connection 2.03 for Windows. This package contains a patch to replace the current Newton Connection 2.00. This document contains information about the installation of the product and details about the problems it fixes.

CONTENTS

=====

- I. Updating the Newton Connection Kit to version 2.03
- II. Release Notes for Newton Connection 2.03
 - 1. Equate Spreadsheet import problem fixed
 - 2. Motorola Marco names problem fixed

I. Updating the Newton Connection Kit to version 2.03

=====

To upgrade your existing version of the Windows Connection Kit to version 2.03, simply copy the following four files to a floppy diskette:

INSTALL.BAT
PATCH.EXE
PATCT.RTP
README.WRI

Once the floppy diskette is created with the 4 files, run the INSTALL program from a DOS prompt by typing A:\Install. The INSTALL program will locate your existing NEWTON.EXE and update it to version 2.03 of the Windows Connection

Kit.

II. Release Notes for Newton Connection 2.03

=====

1. Equate Spreadsheet import problem fixed

The previous version of Windows Connection Kit did not allow spreadsheet data to be imported and synchronized with Equate. This problem has been corrected. Importing data with Equate requires translators provided by Holosoft Inc. If you have not received these translators, contact Holosoft at 408.748.9648.

2. Motorola Marco names problem fixed

On the Motorola Marco, email data fields would not display in the Names overview. This has been fixed so that all data associated with internal apps is now visible within the Overview window. This fix requires new synchronization files to be generated in order to display all data.

Article Created: 15 November 1996

TOPIC -----

This article contains the LaserWriter 10/300 A3 Plus press release. This LaserWriter printer is only available in China.

DISCUSSION -----

Apple Announces Integrated Solution for China's Entry-Level and Corporate Publishing Market Includes Apple's First A3 Laser Printer with Full Bleed

Beijing—November 8, 1996... Apple Chairman and CEO Dr. Gilbert F. Amelio today underscored Apple's commitment to China's publishing market, announcing a low-cost, integrated publishing solution aimed at entry-level users, small- to medium-sized publishers, and corporate customers.

The Quick Start Publisher Pro solution, the first of its kind created specifically for China, combines the latest technology from Apple with leading third-party software applications and fonts. It also includes the Apple LaserWriter 10/600 A3 Plus printer, Apple's first laser printer supporting full-bleed printing on A3 paper.

"China is a market of great strategic importance to Apple," said Dr. Amelio. "Apple believes its strengths in publishing, education, graphics, design, and multimedia applications are very attractive to this high growth market. With solutions specifically targeted at Chinese customers, Apple will have a unique competitive advantage. We intend to continue working closely with our Chinese partners to be a significant participant in the Chinese information market, over the long term."

Quick Start Publisher Pro is designed to deliver what entry-level publishing customers want, including an affordable price, A3 printing capabilities, and high-quality, bundled software. It comes with everything needed to get started, and will run on any Power Macintosh 7200, 7600, 8500, or 9500.

"Quick Start Publisher Pro offers everything that commercial printers and corporate clients have been asking for: ease of use, power, value, and superior typography," said Vincent Tai, General Manager of Apple China/Hong Kong. "These products offer superior value for the entry-level publishing market—from the world's leading publishing vendor."

"With Quick Start Publisher Pro, we are launching the Apple LaserWriter 10/600 A3 Plus printer, a first-of-its-kind design from Apple," said Maury Austin, Vice President of Apple Imaging Division. "It delivers the features that customers in China need most—fast two-byte printing, PostScript support through QuickDraw GX, and printer sharing."

Fast, Full-Bleed A3 Printing

The Apple LaserWriter 10/600 A3 Plus offers 600 dot-per-inch resolution and full-bleed printing on A3 pages. It comes with PostScript conversion software that allows users to print Encapsulated PostScript (EPS) files while sharing the printer over a network. In addition, by using a separate PCI card as the controller and a video connection, the Apple LaserWriter 10/600 A3 Plus printer provides extremely fast throughput of Chinese text and images—up to 10 pages per minute on A4-size paper and 5 ppm on A3-size paper.

Mac OS: Powerful Graphics, Type, and Color Capabilities

The Mac OS is the system software of choice in the publishing industry, and Quick Start Publisher Pro offers a unique solution for working with colorful graphics and Chinese type.

QuickDraw GX, which is built into the Mac OS, is Apple's color publishing platform for printing documents and drawing graphics and text. It provides a rich set of typography features, a sophisticated graphics system, and a more reliable, more consistent use of color.

Using the QuickDraw GX-based software in Quick Start Publisher Pro, for example, users can combine Chinese characters and Roman text horizontally or vertically, reading left-to-right or right-to-left. Because QuickDraw GX treats characters as graphic elements, users can manipulate text in a number of ways. For example, they can scale, skew, and rotate characters, or alter a font's outline and change its ink density to give it a more hand-drawn look.

With WorldScript, the Mac OS technology which supports multiple languages, users can mix Chinese and English—or any other major language—within a single document.

Once satisfied with a document, users can print exactly the same image they see on the screen—with colors, positioning, and orientation all intact—or they can create Portable Digital Documents that can be viewed without the same fonts or application on other systems, and printed correctly on any printer.

Whether outputting to paper or saving as a digital document, users can get more predictable and accurate color with ColorSync, Apple's system-level color technology for Mac OS. ColorSync automatically matches the color profiles of applications, scanners, digital cameras, displays, and printers that do not share the same color range.

Pre-Installed Software

To provide a complete publishing solution, Quick Start Publisher Pro comes with a variety of page-layout, illustration, font, and clip-art applications. This software bundle includes Ready-Set-Go! GX from Daiwan Software; Lightning Draw GX from Lari Software; GX fonts from DynaLab and Sinotype; and 1,000 clip-art images from T-Maker.

Publishing Leadership, China Initiatives

Macintosh is the worldwide platform of choice for publishing professionals. In the world's biggest publishing market, the U.S., 80% of all computers used for color publishing jobs in the advertising, graphic design, printing, publishing and prepress industries are Macintosh, according to a 1996 study by Griffin Dix Research Associates.

In China, Apple is committed to sharing its expertise and experience with the publishing industry. In November 1994, for example, Apple opened the Apple Publishing Technology Center, the first of its kind in China. Established in partnership with the China Research Institute of Printing Science and Technology, a research organization under the Press and Publication Administration of China, and with the cooperation of 15 other vendors who provided key publishing hardware and software, the center today offers a wide range of services, including system integration, consulting, training and high-quality output services.

Today's announcement underscores Apple's long-term commitment to the Chinese publishing market, and the company's belief that the Mac OS provides the best available Chinese-language computing solution.

Pricing and Availability

Quick Start Publisher Pro will be available in December from Apple authorized resellers in China for about US\$2,000. It comes standard with the Apple LaserWriter 10/600 A3 Plus with PCI card, Ready-Set-Go! GX, Lightning Draw GX, DynaLab and Sinotype fonts, and T-Maker clip art. Customers can use the solution with any Power Macintosh system.

Apple Computer, Inc., a recognized innovator in the information industry and leader in multimedia technologies, creates powerful solutions based on easy-to-use personal computers, servers, peripherals, software, personal digital assistants and Internet content. Headquartered in Cupertino, California, Apple develops, manufactures, licenses and markets solutions, products, technologies and services for business, education, consumer, entertainment, scientific and engineering and government customers in more than 140 countries.

Apple Asia covers Bangladesh, Brunei, Guam and Micronesia, Hong Kong, India, Indonesia, Korea, Laos, Malaysia, Nepal, Pakistan, the Philippines, the People's Republic of China, Singapore, Sri Lanka, Taiwan, Thailand and Vietnam.

Power Macintosh 4400 Series (non-USA): Description (11/96)

Revised: 11/18/96
Security: Everyone

Power Macintosh 4400 Series (non-USA): Description (11/96)

=====

Article Created: 18 November 1996

TOPIC -----

This article contains the description for the Power Macintosh 4400 series computers.

IMPORTANT: The Power Macintosh 4400 Series is currently only available in Europe.

DISCUSSION -----

Apple's Power Macintosh 4400/160 combines affordability with high performance to provide an ideal system for small and medium-size businesses, education institutions, home offices, and for running productivity applications in any size of organization. Based on high-performance RISC technology, the Power Macintosh 4400/160 computer features a 160-megahertz PowerPC 603e processor.

The three industry-standard Peripheral Component Interconnect (PCI) expansion slots on the Power Macintosh 4400/160 let you customize the Power Macintosh 4400/160 computer easily to more precisely meet your needs. You can find many PCI cards for a variety of uses, including graphics, storage, and high-speed networking.

The Power Macintosh 4400/160 can be connected to a variety of high resolution displays, including the 14" Multitple Scan, 15" Multitple Scan, 15" Multitple Scan AV and Multitple Scan 1710 displays, offering a wide range of viewing capabilities at various price points.

Built-in LocalTalk networking is provided for easy connections to printers and file servers and a PCI card can be added to the Power Macintosh 4400/160 for connection to the Ethernet or other highspeed networks.

So whether you need power and expandability for everyday number crunching, office productivity, or an innovative multimedia project--or want a fast, easy way to get started with the Internet--the Apple Power Macintosh 4400/160 offers

the features you need at an affordable price.

Features

=====

High performance

- * 160 MHz PowerPC 603e processor
- * Built-in floating-point processor and internal 32K cache
- * Optional 256K Level 2 cache
- * 2D graphics acceleration

Communications and multimedia

- * Two high-speed serial ports compatible with GeoPort and LocalTalk cables
- * 8X ATAPI CD-ROM drive
- * 16-bit stereo audio input and output

Expandability

- * Three industry-standard PCI expansion slots (45 Watts combined power allowance for all three slots)
- * External SCSI connector for external hard disks, CD-ROM drives, and other SCSI devices
- * Up to 96 MB of system memory
- * Up to 4MB of graphics memory

Compatibility

- * Supports Open Transport networking software (TCP/IP and AppleTalk)
- * Runs most 680x0 Macintosh applications as well as applications accelerated for Power Macintosh computers
- * Reads Mac OS, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats

System 7.5 Software

- * Makes working with different applications consistent, so they're easier to learn and use
- * Allows easy customization of your Macintosh to reflect the way you work
- * Provides active assistance in learning new features with Apple Guide

Ordering Information

=====

Power Macintosh 4400/160

* Power Macintosh 4400/160 computer with 16 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 1.2 GB IDE hard disk drive and an internal eight-speed ATAPI CD-ROM drive. Includes keyboard & mouse; system software version 7.5.3 or later; complete setup, learning, and reference documentation and limited warranty.

Power Macintosh GeoPort Telecom Adapter

Order No. M3127**/A

LaserWriter Printer Driver 8.4.1 & PageMaker 6 Issue (11/96)

Revised: 11/19/96
Security: Everyone

LaserWriter Printer Driver 8.4.1 & PageMaker 6 Issue (11/96)

=====

Article Created: 18 November 1996

TOPIC -----

I have just upgraded to LaserWriter 8.4 or 8.4.1 and now whenever I print from PageMaker 6, I get an extra blank page printed.

DISCUSSION -----

This is a known issue between PageMaker 6.0 and LaserWriter driver 8.4 or 8.4.1. There have also been reports of what you describe occurring with Freehand 5.5 and PhotoShop 3.0.4, however, we have not been able to reproduce this issue with these applications.

A workaround is to hold the option key down when choosing Print from the File menu. The Option key forces PageMaker to use the LaserWriter driver instead of PageMaker's internal driver.

As a longer term solution, we have alerted Adobe to this issue. Apple Engineering will also be putting a workaround to this in place with future revisions of the LaserWriter printer driver.

TextBridge 3.0H & Other Supported Scanners (11/96)

Revised: 11/18/96
Security: Everyone

TextBridge 3.0H & Other Supported Scanners (11/96)

=====

Article Created: 18 November 1996

TOPIC -----

Does the new TextBridge 3.0H software support any scanners other than the Apple Color OneScanner 600/27 and 1200/300?

DISCUSSION -----

The TextBridge manual we distribute with the Apple Color OneScanner 600/27 and 1200/30 answers your question.

The TextBridge application will support a variety of scanners, those that are TWAIN compatible, those listed both in the TextBridge manual on pages 1-5 and 2-8, and those on their web page. The two scanner drivers bundled with the Color OneScanners provide support for the Apple Color OneScanner 600/27 and 1200/30.

The TextBridge version Xerox Imaging Systems distributes comes with more drivers. Also, on page 1-5 of their manual lists approximately 30 supported drivers from Pixel Translations Incorporated. (We believe Pixel Translations Inc. is now a part of Cornerstone Imaging.)

Cornerstone Imaging may be reached at:
<http://www.cornimage.com>

Xerox can be reached at:
<http://www.xerox.com>

TextBridge information may be obtained at:
<http://www.xerox.com/xis/tbpro30mac/>

Tips

====

Installing Peripheral Component Interconnect (PCI) Cards

Some PCI cards must be installed in a particular slot in your computer. Consult the PCI card's user's manual, ReadMe file, or the card manufacturer to determine if the card you are installing must be installed in a certain slot.

Troubleshooting

=====

IMPORTANT: For more troubleshooting information on the problems described below and on other topics, refer to Macintosh Guide (available in the Guide menu when the Finder is active). The manuals that came with your computer may also contain helpful information.

Problems when Resetting Parameter RAM (PRAM)

When you restart your computer while holding down the key combination Command-Option-p-r, the PRAM is not reset. To successfully reset the PRAM,

restart the computer but do not hold down the key combination until after you hear the computer's startup sound (usually a musical chord, chime, or beep).

Problems Turning off System Extensions

When you hold down the shift key while starting or restarting your computer, the system extensions are not turned off. To successfully turn off system extensions, start or restart the computer but do not hold down the Shift key until after you hear the computer's startup sound (usually a musical chord, chime, or beep).

Problems Using a Video Adapter

When you use a video adapter to connect a VGA display after using an RGB display with your computer, the VGA display is at a lower resolution than the RGB display. When you use a video adapter to connect a VGA display and an RGB display, the VGA display cannot provide the same resolution as the RGB display.

Printing Problems

* You have trouble printing on a StyleWriter or StyleWriter II printer. Use the StyleWriter 1200 printer driver that came installed on your computer. Do not install your older StyleWriter driver; it is not compatible with PowerPC-based computers.

* You can't use the "Print Later" option with a non-networked printer. If you have the Assistant Toolbox extension installed on your computer and you want to use the "Print Later" option when printing on a non-networked printer, you must turn off the Assistant Toolbox extension and restart your computer.

To turn off the Assistant Toolbox extension:

1. Open the Apple (*) menu and choose Control Panels.
2. Open the Extensions Manager control panel.
3. In the list of extensions, click next to the Assistant Toolbox extension to remove the check mark.
4. Restart your computer.

* You see a low-memory warning when you print Stickies on a StyleWriter, StyleWriter II, or StyleWriter 1200 printer. This problem can occur when the amount of memory Stickies uses is set below 150K. Try increasing the amount of memory available to Stickies. For instructions on changing the memory a program uses, refer to Macintosh Guide (available from the Guide menu when the Finder is active).

Performance Problems

* You see a message that not enough memory is available. This problem can occur for several reasons. For detailed tips on memory-related problems, refer to both the troubleshooting information in the manuals that came with your computer, and to the information on memory in Macintosh Guide (available in the Guide menu

when the Finder is active).

* If this problem occurs after you have opened the Extensions folder in the System Folder and scrolled through a long list of extensions, you can restore normal performance by restarting your computer.

* Microsoft applications such as Microsoft Word, PowerPoint, or Microsoft Excel display messages that not enough memory is available and that you need to increase the size of memory available. Try quitting all applications before launching Microsoft applications. This will free additional memory for the application. If this does not work, then try turning on virtual memory providing additional memory for the application and system. The documentation that came with your computer may contain more information about virtual memory.

Problems with Sound

HyperCard version 2.3.3 or earlier does not record sound properly on your computer. Other sound recording application programs, including SimpleSound and the Sound control panel, can record sounds that you can import and play within HyperCard 2.3.

Problems Using a RAM Disk

You notice performance problems when using a RAM disk. Make sure the RAM disk size is not set to 100% or you may experience performance problems.

Problems with Programs Freezing or Quitting Unexpectedly

* Maple V quits unexpectedly when you change your monitor resolution. This can occur if you use the Control Strip to change the monitor resolution while the Maple V program is active. Use the Monitors & Sound control panel instead of the Control Strip to change screen resolution. For instructions on using the Monitors & Sound control panel, refer to Macintosh Guide (available in the Guide menu when the Finder is active).

* When you try to install Adobe Premiere Deluxe, the mouse freezes. This can occur if you have virtual memory turned on and AppleTalk active when you try to install Adobe Premiere Deluxe. Turn off virtual memory and make AppleTalk inactive before installing. For instructions, refer to Macintosh Guide (available from the Guide menu when the Finder is active).

This problem does not occur if you select Adobe Premiere 4.2 installation instead of Adobe Premiere Deluxe.

Problems With Monitors

* You have difficulty choosing a video resolution that works well with your hardware. To select the best video resolution to use with your display and computer, use the control strip displayed in the bottom left corner of your screen. (If the control strip is not visible, display it by choosing Control Strip from the Control Panels menu available under the Apple menu.) The recommended resolutions are listed in a plain font. The resolutions listed in italics may not work with your hardware.

* While using video mirroring (a second monitor connected to your computer that shows the same images displayed on the first monitor), you restart or shutdown your computer and both of your monitors appear black or gray when the computer starts up again. Unplug the monitor cable that is connected to the PCI video card in your computer and restart the computer. Or, if you still want to use video mirroring, leave the second display connected to the PCI video card and turn video mirroring off in the Monitors & Sound control panel (available under Control Panels in the Apple menu) before restarting or shutting down your computer. When your computer has restarted, you may turn video mirroring back on in the Monitors & Sound control panel.

Compatibility Problems

=====

DOS Compatibility Cards

PCSetup is an application program that comes with DOS compatibility cards. PCSetup version 1.5 or earlier may not work with your computer due to minor incompatibility problems.

If you have the DOS compatibility card sound cables installed then the output from the audio will be reversed.

CDPlusGraphics

Your computer displays error messages when you use the CDPlusGraphics application to play a CD-ROM disc that contains both sound and graphics. The graphics tracks of CD+G discs and MIDI tracks of CD+MIDI discs cannot be played on the internal CD-ROM drive in your computer. (However, the audio tracks of these CDs can be played.) To play CD+G and CD+MIDI discs, use an external SCSI CD-ROM drive.

At Ease for Workgroups 3.0 and 3.0.1

In the At Ease Setup program, the "Lock startup volume" check box in the User Settings dialog box is dimmed and unavailable. To make the check box available, install the At Ease for Workgroups Updater version 3.0.2, which is in the Apple Extras folder on the system software CD that came with your computer.

If you are using a version of At Ease prior to 3.0.2, do not remove the "At Ease ATA Extension" in your Extensions folder. (This extension prevents the "Lock startup volume" check box from being available.) If you are using At Ease 3.0.2 or later or you are not using At Ease at all, you may remove the "At Ease ATA Extension."

For more information, refer to the SimpleText file in the the At Ease for Workgroups Updater folder in the Apple Extras folder on the system software CD that came with your computer.

Ethernet Cards

* The Ethernet CS II Card requires Open Transport software. To use Open Transport, open the Network Software Selector application in the Apple Extras folder, and select Open Transport networking. Then use the AppleTalk and TCP/IP control panels to set up networking with the Ethernet CS II Card. (Do not use the Network and MacTCP control panels.)

* MacIPX is not supported currently by Open Transport and therefore does not work with the Ethernet CS II Card or with any Ethernet PCI card.

* The currently shipping versions of Apple IP Gateway and AppleTalk Internet Router are not compatible with Open Transport.

Japanese and Chinese Language Kits

* To use the Japanese Language Kit with your computer, you must install version 1.2 or later. In the United States, you can obtain an upgrade by calling Claris at 1-800-293-6617.

* To use the Chinese Language Kit with your computer, make sure you use version 1.1.1 or later. To install the Chinese Language Kit version 1.1.1, follow these three steps:

1. Install the WorldScript Updater 1.0.
2. Install the Chinese Language Kit version 1.0 or 1.1.
3. Install the Chinese Language Kit Updater to update your software to version 1.1.1.

IMPORTANT: Be sure to follow the steps in the order shown.

STF PowerFax PE

If you use PowerTalk Direct Dialup Mail and have trouble sending a fax, it may be because both Direct Dialup and STF PowerFax PE are set to auto-answer. To turn off STF auto-answer, open the STF Setup window and set 'n' to "never" (in the "Answer on 'n' rings" section).

Emagic Logic Version 2.0.1

In order to use Emagic Logic version 2.0.1, the MIDI Manager extension may be required to enable this onto your computer. Similar applications may also require the MIDI Manager extension.

PCI Video Cards

* The Targa 1000 video card cannot be used with Adobe Premiere version 4.2.1 to capture movies on your computer (although other movie display and editing functions are still available).

* In order to use the Targa 2000 card, you must install it in slot 2 and turn virtual memory off. The manuals that came with your computer may contain more information about turning virtual memory off.

* In order to use Number 9's Imagine 128 video card with the HawkEye control

panel version 4.0.6, you must install the card in either slot 1 or slot 2. If you do not install this control panel, the card can be installed in slots 1, 2, 3, 4, or 5. This card functions best when connected to a multi sync monitor.

* In order to use the Media 100qx card, you must install it in slot 2 and turn virtual memory off. The manuals that came with your computer may contain more information about turning virtual memory off. Also note that this card has special configuration requirements--consult the card's manufacturer to configure your system for best performance.

* In order to use the ATI XClaim GA video card, you must have SGRAM video memory installed in your computer. This card is not compatible with systems containing EDO and SDRAM video memory.

Video Support

=====

DIMM Support

4 MB EDO (Extended Data Output) video DIMMs will fit in the DIMM slots on your computer's main logic board, but they are not supported on your computer. Your computer supports SGRAM DIMMs in 1, 2, and 4 MB sizes, SDRAM DIMMs in 1, 2, and 4 MB sizes, and EDO DIMMs in 1 and 2 MB sizes.

Video DIMM Performance

EDO DIMMs provide good performance. SDRAM DIMMs provide improved performance over EDO DIMMs. SGRAM DIMMs provide the highest level of performance.

Note that if you have EDO memory installed in your computer and have reinstalled system software using either the net install or floppy disks, you may see some very small images (small dots or lines) displayed outside the perimeter of windows displaying QuickTime movies or some video games. To eliminate this problem, drag the 4400/160 Graphics Extension from the Apple Extras folder of the system software CD-ROM disc to the System Folder on your computer's hard disk. Computers with SDRAM or SGRAM installed do not experience this problem.

VGA-to-RGB Monitor Adapter

If you have a computer with an RGB video connector and a VGA monitor, you can use the black VGA-to-RGB monitor adapter (P/N 5900289-A) to connect this display to your computer to provide you with the maximum available resolutions and bit depths.

Important Information About Virtual Memory

=====

Virtual memory (VM) is a feature of the Macintosh that lets you use part of your hard disk as additional memory. If you are using an application program designed especially for Power Macintosh computers (often called a "native" application program), turning on virtual memory lets your application use less memory.

Your computer comes with virtual memory turned on. With virtual memory turned

on, a Power Macintosh program uses less memory than when virtual memory is turned off. If you check the program's Get Info box before and after turning on virtual memory, you'll see that the numbers in the Memory Requirements box change. That is because turning on virtual memory allows the program to use memory more efficiently.

For information on how to turn virtual memory on and off, choose Macintosh Guide from the Guide menu when the Finder is active. Click the Memory topic area, and then click "How do I use hard disk space as memory?" and "Tips for PowerPC-based computers."

For best performance, try setting virtual memory to no more than 150% of the memory (RAM) installed in your computer, or no more than 50% of your currently available hard drive space, whichever number is lower. For example, if your computer has 16 MB of RAM and your hard drive has 50 MB of available space, set virtual memory to a maximum of 24 MB (this is 150% of your 16 MB of RAM, and less than 50% of the available space on your hard drive).

If virtual memory is turned on and you notice performance problems (such as unusually slow computer response) when using certain application programs, you may want to turn off virtual memory.

To improve performance, you can also install more memory (RAM) in your computer. See the user's manual that came with your computer for more information.

Important Information About Document Auto-Save

=====

The Energy Saver control panel contains a feature named "Document Auto-Save." The purpose of this feature is to automatically quit all open applications during an idle or scheduled shutdown, while saving changes to any open documents in each application. Since there are literally thousands of applications available for the Macintosh (with new ones always arriving), we cannot guarantee that Document Auto-Save will be compatible with every application. This is especially true for any application that does not use standard routines to implement the alerts or dialog boxes used to save changes to new or modified documents. When Document Auto-Save is incompatible with an application, it will either not automatically quit, or it will display alerts or dialog boxes that Document Auto-Save does not recognize and therefore does not dismiss.

If you intend to turn Document Auto-Save on, we recommend that you monitor its operation during the first attempted idle or scheduled shutdown and note if any of your applications are not compatible. You can avoid problems with incompatible applications simply by making sure you leave open no documents that are new or modified before an idle or scheduled shutdown is to occur. Alternatively, you can modify the Document Auto-Save preferences in the Energy Saver control panel so the computer will sleep rather than shut down when unsaved documents are open.

For instructions for using Energy Saver & Document Auto-Save, choose Macintosh Guide from the Guide menu when the Finder is active, and choose the Energy Saving topic area.

Other Document-Saving Products

There are conflicts when non-Apple document-saving control panels or extensions are used in conjunction with Energy Saver's Document Auto-Save. Examples of such products are NowSave and SuperBoomerang. For best results, use the document-saving features of only one control panel or extension.

Self-Dismissing Dialogs

Under some rare conditions, the Energy Saver control panel may continuously dismiss dialog boxes if the Document Auto-Save feature unexpectedly fails during an idle or scheduled shutdown. (Whenever a dialog box appears, it is dismissed as if you have pressed the Return key.) To return things to normal, simply click the mouse button or press the space bar.

Important Information About Macintosh PC Exchange

=====

AutoDoubler

To use AutoDoubler with Macintosh PC Exchange, you must first open the AutoDoubler control panel and turn off the "Show DD on Compressed Files" option from the DD menu.

Compressed PC Disks and Files

Macintosh PC Exchange does not work with DOS-format floppy disks or SCSI hard disks that have been compressed using Stacker or other DOS or Windows disk-compression utilities. Before transferring compressed DOS files to a Mac OS-based computer, you must decompress the files and save them to a noncompressed DOS-format floppy disk.

Working With Disks Containing Multiple Partitions

If a SCSI hard disk or removable media cartridge has been formatted to contain multiple partitions, you can use Macintosh PC Exchange to mount the Mac OS-, DOS-, or ProDOS-format partitions as individual volumes on the Macintosh desktop. If the disk contains both Mac OS- and DOS-format partitions, Macintosh PC Exchange will recognize only the Mac OS partition. In addition, Macintosh PC Exchange will recognize ProDOS-format partitions only on SCSI hard disks that are less than 32 megabytes.

You can use Macintosh PC Exchange to erase existing individual partitions on a SCSI hard disk or removable media cartridge if they have the same format. However, you cannot use Macintosh PC Exchange to reformat and resize individual partitions contained on the disk. Nor can you format a Mac OS-format hard disk or removable media cartridge as a DOS-format disk. To resize or reformat multiple Mac OS, DOS, or ProDOS partitions, you need to use third-party software designed for partitioning hard disks and removable media cartridges.

Working with DOS-Format SCSI Removable Media Devices

In order for Macintosh PC Exchange to recognize any SCSI removable media device, you must turn on the device and eject any cartridges before you turn on your

computer.

Do not install the device driver software that came with your removable media device. Instead, open the Macintosh PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your computer. Macintosh PC Exchange will install its own device driver for that SCSI device.

The Eject Disk command is unavailable when you are working with removable media devices. To unmount and eject a removable media cartridge, click the device's icon to select it and choose Put Away from the File menu. Once the device has spun down and the red light goes out, you can manually eject the cartridge from the drive. To access a removable media cartridge that has been ejected, simply reinsert the cartridge in the drive.

When initializing and formatting Bernoulli and SyQuest cartridges on a DOS or DOS-compatible computer, use either the disk setup and partitioning software that came with the SCSI controller card installed in your PC or the one that came with your Bernoulli or SyQuest device. (Do not use the MS-DOS FDISK command.) Also, use the MS-DOS FORMAT command to format a newly initialized removable media cartridge on a DOS or DOS-compatible personal computer (PC) before you copy DOS files onto it.

When you initialize a removable media cartridge on a DOS or DOS-compatible PC, you must fully partition, initialize, and erase the cartridge using the software that came with your SCSI controller card or removable media drive. If you do not, Macintosh PC Exchange may not recognize the new DOS-format partitions on that cartridge.

Working with DOS-Format SCSI Hard Disk Drives

In order for Macintosh PC Exchange to recognize a SCSI hard disk drive, you must turn on the drive before you turn on your computer.

Do not install the device driver software that came with your removable media device. Instead, open the Macintosh PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your computer. Macintosh PC Exchange will install its own device driver for that SCSI device.

When initializing and formatting an external SCSI hard disk connected to a DOS or DOS-compatible PC, use the MS-DOS FDISK command or the disk setup and partitioning software that came with the SCSI controller card installed in your PC. In addition, you should use the MS-DOS FORMAT command to format and erase the disk before you copy DOS files to a new SCSI hard disk connected to a PC.

Tips and Problems

* A "Sad Mac" icon may appear on your screen at startup if a removable media cartridge has been left in the drive. To keep this problem from occurring, manually eject removable media cartridges from their drives before you turn on your computer.

* Macintosh PC Exchange cannot recognize SCSI hard disks, removable media devices, or drive container files that contain more than one gigabyte of disk

space.

Newton Connection Kit: Isn't Compatible w/ Newton 2.0 OS (11/96)

Revised: 11/18/96
Security: Everyone

Newton Connection Kit: Isn't Compatible w/ Newton 2.0 OS (11/96)

=====

Article Created: 18 November 1996

TOPIC -----

I recently upgraded my Apple MessagePad 120 with the Newton 1.x OS to a Apple MessagePad 130 with the Newton 2.0 OS installed. I can no longer get my Newton Connection Kit to work. Why?

DISCUSSION -----

You cannot use the Newton Connection Kit with the Newton 2.0 OS. A replacement for the Newton Connection Kit will be available from Apple Computer, Inc. at a later date. In the meantime, look at the Tech Info Library article titled "Newton OS 2.0: Newton Connection Utility Alternatives". This article proves several options for transferring data from a Newton 2.0 OS device to both a Macintosh or Windows computer.

You can also use the Newton Backup Utility to backup and restore the information on you Apple MessagePad 130 device.

This article appeared in the 18 November 1996 issue of the Infomation Alley.

WGS 8550/200 & 7250/120: CD-ROM Disc Differences (4/97)

Revised: 5/1/97
Security: Everyone

WGS 8550/200 & 7250/120: CD-ROM Disc Differences (4/97)

Article Created: 18 November 1996
Article Reviewed/Updated: 28 April 1997

TOPIC -----

When we setup our Workgroup Server (WGS) 7250/120 and Workgroup Server 8550/200 we found very few physical differences between the two computers. We could also not immediately tell the differences on the CD-ROM entitled "Workgroup Server Software - contains System Software Version 7.5.3 for the Workgroup Server 7250 and 8550".

Can you help us determine the changes between the computers and the CD-ROMs discs? Since we have both the older and the newer Workgroup servers, it is very likely that we may mix-up the CD-ROM discs.

DISCUSSION -----

You can tell the difference between the older and newer model Workgroup Servers 7250/120 because the newer model has an 8x CD-ROM drive. The accessory kit contents and the new 8x CD-ROM drive are all that changed on the 7250/120. The newer WGS 8550 model has an 8x CD-ROM drive and runs at 200 MHz.

The CD-ROM discs from the previous models of Workgroup Servers and the newer, faster Workgroup Servers do have unique part numbers, but have the same name as they did in the previous models:

Older Workgroup Server CD part # 691-0718-A
Newer (Speed-bumped) Workgroup Server CD part # 691-1225-A

These part numbers are on printed the CD-ROM discs.

The following is a list of differences between the two CD-ROM discs. Either CD will work just fine on either the older or the newer Workgroup server models.

Added to new CD

The following packages have been added to the CD (691-1225-A):

At Ease Updaters
DOS Compatibility
Desktop Pattern Clippings
MacLinkPlus Translators
MacPPP
OpenDoc
PC Compatibility Software
PlainTalk
Pointer Mode Control
QuickDraw 3D
QuickTime Extras
System Profiler

Was On old CD, Not on New CD

The following packages have been removed from the old CD (691-0718-A):

AppleScript
Expansion Card Info
Universal Access
WorldScript Pieces Install

Upgraded Software on new CD

The following packages have been upgraded on the new CD:

Adobe Acrobat Reader 2.1
Apple RAID 1.1.1 Installer

At Ease 4.0 and AppleShare Access Privileges (11/96)

Revised: 11/19/96
Security: Everyone

At Ease 4.0 and AppleShare Access Privileges (11/96)

=====

Article Created: 18 November 1996

TOPIC -----

After I login as an At Ease user, I notice that the AppleShare access privileges get reset to full access for the Documents folder and it's sub-folders. Is this correct behavior?

DISCUSSION -----

Yes, At Ease resets the AppleShare privileges for the Documents folder and it's sub-folders when the At Ease user logs in to At Ease. This is done to prevent possible problems with use of At Ease due to the access privileges being incorrectly set for those folders.

This has been the behavior of At Ease since version 2.0. A future release of At Ease may change this behavior.

Macintosh 6360/64xx/54xx Update: Read Me (11/96)

Revised: 2/17/97
Security: Everyone

Macintosh 6360/64xx/54xx Update: Read Me (11/96)

Article Created: 19 November 1996

TOPIC -----

This article contains the ReadMe file for the 6360/64xx/54xx Update.

DISCUSSION -----

The 6360/64xx/54xx Update corrects problems that may occur with external SCSI devices and adds support for additional Ethernet network protocols. The Update is designed for use with the following Power Macintosh and Performa models:

- * Macintosh Performa 6360
- * 64xx series Macintosh computers, such as the Macintosh Performa 6400 and the Power Macintosh 6400
- * 54xx series Macintosh computers, such as the Macintosh Performa 5400 and Power Macintosh 5400

Fixes and Features Provided by this Update

The 6360/64xx/54xx Update provides the following corrections and features for 6360, 64xx series, and 54xx series Macintosh computers:

- * Fixes problems with using some external SCSI devices, such as external hard disks, scanners, or removable storage devices.
- * Fixes problems with printing to a Personal LaserWriter SC or LaserWriter II SC printer. Apple recommends using QuickDraw GX and the LaserWriter II SC GX printer driver with LaserWriter SC printers because there are known problems with the non-GX LaserWriter SC printer driver. You can install QuickDraw GX from the system software CD-ROM disc that came with your computer or download the software from the Apple Software Update sites on the Internet via <<http://www.info.apple.com/swupdates/>>, America Online, or CompuServe.
- * Adds support for additional Ethernet network protocols. If your computer uses the optional Ethernet CS II card to provide Ethernet networking, the

6360/64xx/54xx Update installs files that provide support for the MacIPX and Local Area Transport (LAT) network protocols.

Installing the 6360/64xx/54xx Update

=====

To install the 6360/64xx/54xx Update, do the following:

1. Start up your computer.

If one or more external SCSI devices are preventing your computer from starting up properly, turn them off before starting up. If your computer still does not start up, turn off your computer and SCSI devices. Then disconnect the SCSI devices and try starting up your computer again.

2. Double-click the Installer icon.

3. Click the Switch Disk button until your hard disk appears in the Destination Disk window.

4. Click the Install button.

5. Click the Restart button after installation was successful.

6. Shut down the computer and reconnect the external SCSI devices that you may have disconnected in step 1. Then start up your computer again.

If you are having problems starting up your computer with external SCSI devices attached, refer to the information on connecting external SCSI devices in your Macintosh user's manual, or contact the manufacturer of your external SCSI device.

Note: If you later reinitialize your internal hard disk with Drive Setup 1.1 or earlier, the fixes installed by the 6360/64xx/54xx Update will be removed, and you will need to install it again. (Most likely you will never need to reinitialize your hard disk, which was set up properly at the factory. Before you reinitialize your hard disk, see the troubleshooting information in your Macintosh user's manual for more information.)

What is installed by the 6360/64xx/54xx Update?

=====

SCSI updates

The 6360/64xx/54xx Update installer installs a patch to a partition on your internal hard drive and installs updated resources into your System file in the System Folder. None of the SCSI Update files are visible after installation. To confirm whether or not the update is installed, you should check that the new files listed below are in your Extensions folder.

Ethernet updates

The 6360/64xx/54xx Update installer installs the files "PCI Network Legacy Layer" and "PCI Network Legacy Loader" into your Extensions folder in your

System Folder.

Macintosh 6360/64xx/54xx Update: Read Me (2/97)

Revised: 2/25/97
Security: Everyone

Macintosh 6360/64xx/54xx Update: Read Me (2/97)

Article Created: 19 November 1996
Article Reviewed/Updated: 25 February 1997

TOPIC -----

This article contains the ReadMe file for the 6360/64xx/54xx Update.

NOTE: The 6360/64xx/54xx Update fixes have been rolled into Mac OS 7.6. If you have installed Mac OS 7.6, you do not need the 6360/64xx/54xx Update.

DISCUSSION -----

The 6360/64xx/54xx Update corrects problems that may occur with external SCSI devices and adds support for additional Ethernet network protocols. The Update is designed for use with the following Power Macintosh and Performa models:

- * Macintosh Performa 6360
- * 64xx series Macintosh computers, such as the Macintosh Performa 6400 and the Power Macintosh 6400
- * 54xx series Macintosh computers, such as the Macintosh Performa 5400 and Power Macintosh 5400

Fixes and Features Provided by this Update

The 6360/64xx/54xx Update provides the following corrections and features for 6360, 64xx series, and 54xx series Macintosh computers:

- * Fixes problems with using some external SCSI devices, such as external hard disks, scanners, or removable storage devices.
- * Fixes problems with printing to a Personal LaserWriter SC or LaserWriter II SC printer. Apple recommends using QuickDraw GX and the LaserWriter II SC GX printer driver with LaserWriter SC printers because there are known problems with the non-GX LaserWriter SC printer driver. You can install QuickDraw GX from the system software CD-ROM disc that came with your computer or download the software from the Apple Software Update sites on the Internet

via <<http://www.info.apple.com/swupdates/>>, America Online, or CompuServe.

* Adds support for additional Ethernet network protocols. If your computer uses the optional Ethernet CS II card to provide Ethernet networking, the 6360/64xx/54xx Update installs files that provide support for the MacIPX and Local Area Transport (LAT) network protocols.

Installing the 6360/64xx/54xx Update

=====

To install the 6360/64xx/54xx Update, do the following:

1. Start up your computer.

If one or more external SCSI devices are preventing your computer from starting up properly, turn them off before starting up. If your computer still does not start up, turn off your computer and SCSI devices. Then disconnect the SCSI devices and try starting up your computer again.

2. Double-click the Installer icon.

3. Click the Switch Disk button until your hard disk appears in the Destination Disk window.

4. Click the Install button.

5. Click the Restart button after installation was successful.

6. Shut down the computer and reconnect the external SCSI devices that you may have disconnected in step 1. Then start up your computer again.

If you are having problems starting up your computer with external SCSI devices attached, refer to the information on connecting external SCSI devices in your Macintosh user's manual, or contact the manufacturer of your external SCSI device.

Note: If you later reinitialize your internal hard disk with Drive Setup 1.1 or earlier, the fixes installed by the 6360/64xx/54xx Update will be removed, and you will need to install it again. (Most likely you will never need to reinitialize your hard disk, which was set up properly at the factory. Before you reinitialize your hard disk, see the troubleshooting information in your Macintosh user's manual for more information.)

What is installed by the 6360/64xx/54xx Update?

=====

SCSI updates

The 6360/64xx/54xx Update installer installs a patch to a partition on your internal hard drive and installs updated resources into your System file in the System Folder. None of the SCSI Update files are visible after installation. To confirm whether or not the update is installed, you should check that the new files listed below are in your Extensions folder.

Ethernet updates

The 6360/64xx/54xx Update installer installs the files "PCI Network Legacy Layer" and "PCI Network Legacy Loader" into your Extensions folder in your System Folder.

Apple MPEG Media System: Can't Copy Part of an MPEG Movie 11/96

Revised: 11/19/96
Security: Everyone

Apple MPEG Media System: Can't Copy Part of an MPEG Movie 11/96

=====

Article Created: 18 November 1996

TOPIC -----

I am using the Apple MPEG Media System and MoviePlayer to play a MPEG movie file. I copied a small part of the movie to a new MoviePlayer file, but when I save it as a self-contained movie, it saves as the same size as the original movie. If I saved it normally (with dependencies), the file size is small but cannot be played without the original MPEG movie. Why?

DISCUSSION -----

There is an inherent limit with MPEG which disallows a subset of the whole video to be moved out by itself. It is possible to extract only the parts you want to use, but it requires writing code to go and get certain required overhead information from the MPEG movie. So, it is possible to make a smaller subset of a larger video, but only if extra code is written. Without writing code, as you have discovered, when you copy a sequence from a MPEG video and save it as a self contained movie, it will be the same size as the original.

If you do not make an edited movie self-contained (not flattened), you have a "chapter marker" movie. Since the default save mode of Movie Player is a reference file (not a flattened/self contained file), the default movie format is very small since It is only a reference to a location within the full MPEG movie file.

Important:

You cannot copy a MPEG movie from a video CD (CDi) to a hard disk for playback. The block sizes of the CD-ROM disc and hard drive are different, so checksums will not match.

AppleShare 4.2.x and Network Trash Recovery (11/96)

Revised: 11/20/96
Security: Everyone

AppleShare 4.2.x and Network Trash Recovery (11/96)

=====

Article Created: 19 November 1996

TOPIC -----

I'm trying to recover a file I accidentally deleted on the AppleShare File Server. The file is in the Network trash folder, however, this folder is invisible and I'm unable to drag the file out of the folder. How do I get it back?

DISCUSSION -----

You cannot restore a Network Trash file from within AppleShare or AppleShare Admin. You can make the Network Trash folder visible by using ResEdit or similar utility application, and then move the file where you want to save it.

WARNING:

The instructions in this article refer to using ResEdit. Apple Computer, Inc., is not liable for any damage done to your software through the use of ResEdit to alter software. The User Assistance Center phone representatives (at 800-SOS-APPL) do not provide technical support for ResEdit. It is supported by APDA. For contact information on APDA, search the Tech Info Library under "APDA".

French Mac OS Update 2.0 & FU1 Version Issue (11/96)

Revised: 11/20/96
Security: Everyone

French Mac OS Update 2.0 & FU1 Version Issue (11/96)

=====

Article Created: 19 November 1996

TOPIC -----

I have a computer running the French version of System 7.5. The computer's modem sounds do not work in communications applications like Global Village's Z-Term, although MegaPhone does seem to have the modem sounds available. The modem will connect without a problem, but I cannot hear the modem handshake or connection.

After updating to System 7.5.3, I noticed other sound related problems on my computer. Audio CDs mount on the desktop and the Audio CD Player does recognize them, but there is no sound output. The Playthrough option is not available in the Sound or Monitors and Sound control panels. System sounds do not play consistently. Lastly, there is no sound output from the modem within MegaPhone. I have performed numerous clean system software installations and updates, but I cannot resolve this issues.

DISCUSSION -----

The issues you describe are related to the FU1 version of the French OS Update 2.0. This version of the update has been available from the Apple Canada Web Site for about 6 months. The FU2 version will take care of most of the issues related to sound on Macintosh Performa and Power Macintosh computers. The only issues not addressed are modem sounds. These are more related to localized versions of the drivers supplied by Global Village and are under investigation by Apple Engineering and Global Village.

Unfortunately, the Mise A Jour FU1 -7.5.3 CD-ROM is the version currently shipping from Claris Canada. The FU2 version is available from Apple Canada's Web Site as well as from SOFTWARE Updates site in the US.

Open Transport/PPP: Removing OT/PPP (11/96)

Revised: 11/20/96
Security: Everyone

Open Transport/PPP: Removing OT/PPP (11/96)

Article Created: 20 November 1996

TOPIC -----

This article describes how to remove Open Transport/PPP (OT/PPP).

DISCUSSION -----

To disable and remove Open Transport/PPP software by using the Custom Remove option in the Installer, follow these steps:

- Open the Installer application included with Open Transport/PPP 1.0. The Welcome to the Apple Installer screen appears.
- Click the Continue button. The Open Transport PPP Installation screen appears.
- Choose Custom Remove from the pop-up menu in the upper-left corner.
- In the list that appears, select the files you would like to remove by clicking the box next to each file so that an "X" appears in it. To completely remove Open Transport/PPP, select all of the files listed.
- Click the Remove button. If a window appears asking whether to quit any open applications, click Continue.
- When the window indicating a restart is required appears, click the Restart button.

To disable Open Transport/PPP without using the Installer, follow these steps:

NOTE: Although the PPP and Modem control panels appear in the Extensions Manager, there is no component in the Extensions Manager to disable Open Transport/PPP. To disable Open Transport/PPP without using the Installer, follow the instructions given here.

- Move the OpenTpt Remote Access, OpenTpt Modem, and OpenTpt Serial Arbitrator shared libraries from the Extensions folder in the active System Folder.

NOTE: This step is also useful in returning the computer system to a

default condition.

- Move the PPP Commands file from the Scripting Additions folder in the Extensions folder.
- Move the PPP and Modem control panels from the Control Panels folder in the active System Folder.
- Restart the computer.

It is not necessary to move the Modem Scripts folder from the Extensions folder.

OT/PPP 1.0 & Global Village Combo PC Card Incompatible (5/97)

Revised: 5/5/97
Security: Everyone

OT/PPP 1.0 & Global Village Combo PC Card Incompatible (5/97)

Article Created: 20 November 1996
Article Reviewed/Updated: 5 May 1997

TOPIC -----

Using the Global Village PowerPort Platinum Pro PC Card (for PowerBook computers) and trying to connect with OT/PPP 1.0, I sometimes get this error dialog which states:

"The connection attempt failed: The port may already be in use by another application.

Check for other uses of the port, like an extension that receives faxes or a communication program. Also check the AppleTalk control panel to see if AppleTalk is set to use the same port being used by the Modem control panel."

DISCUSSION -----

This behavior is caused by an incompatibility between OT/PPP 1.0, and the Global Village PowerPort Platinum Pro PC Card. This is the PC card that has combined Ethernet and a 28.8 kbps modem.

Global Village has released updated software that should resolve the issue. It is available from the Global Village software update site:

ftp://ftp.globalvillage.com/pub/software/mac/PP_PC_Card_beta_OT_PPP.sea.hqx

At Ease Administration: Error While Editing Workgroup (11/96)

Revised: 11/21/96
Security: Everyone

At Ease Administration: Error While Editing Workgroup (11/96)

=====

Article Created: 21 November 1996

TOPIC -----

I am using At Ease Administration to administer my At Ease 4.0 network. When I try to change the information in one of my workgroups I get the following error, "An error occurred while trying to edit the workgroup xxxxxx." What do I do to fix this?

DISCUSSION -----

The workgroup you are working with has probably become corrupted and cannot be fixed. One option is to duplicate the workgroup by clicking the Duplicate button. The duplicate can now be edited, so you can delete the original and use the duplicate.

Another option would be to delete the workgroup which is getting errors, and build a new workgroup.

At Ease 3.0.3 Updater Read Me (11/96)

=====

Article Created: 21 November 1996

TOPIC -----

This article is the At Ease 3.0.3 Updater ReadMe file, and it contains important information about the At Ease 3.0.3 Updater.

DISCUSSION -----

Contents

=====

Requirements for Updating

- Version 3.0 Already Installed
- Updating Some or All Workstations
- Using an AppleShare Server for At Ease for Workgroups

Updating Procedure

- Installation Options
- Files the Updater Needs to Locate
- Updating From the Floppy Disk
- Updating Over the Network
- Using an Updated Copy of the Administration Program
- New Desktop Printer Extension

Changes Made in Previous Versions

- Using the Lock Startup Disk Feature
- System Startup Crashes While Using Open Transport
- Possible Hard Disk Corruption on IDE Hard Disks When Using the Lock Startup Volume Feature
- Launching Applications From Other Applications
- Login Procedure
- At Ease Setup Changes

Clarifications

- Using Kid Pix Studio (Correction to Read Me for At Ease 3.0)

- CD-ROMs and At Ease
- Documents Created by Approved Applications
- Server Mounting in At Ease
- Disk Security
- At Ease and File Sharing
- Maximum Number of Connected Users on an At Ease Server
- Bypassing At Ease at Startup on Certain Power Macintosh Models
- At Ease and RAM Doubler
- At Ease and Hard Disk Toolkit (HDT)
- At Ease and QuickMail

Major Problems Corrected in Versions 3.0.1-3.0.3

- Users Visible After Update From Version 2.x
- No Report of Damaged Preferences File at Login
- Shorter Login or Logout Times on Large Systems
- Documents Panel Remains Visible
- Setup Application Correctly Recognizes Setups
- Virex Incompatibility Corrected
- Items in the Apple Menu Remain Visible
- Servers Mount Correctly
- Import Users Function Works Correctly
- Middle-Level Administration

The At Ease 3.0.3 Updater updates At Ease 3.0 or At Ease for Workgroups 3.0, 3.0.1, or 3.0.2 to the latest version, 3.0.3. The changes in version 3.0.3 primarily affect non-workgroups users because previous updates have addressed many problems in the workgroups product.

At Ease for Workgroups 3.0.2 users do not need to update to version 3.0.3. All problems with the workgroups product discussed in this document were corrected in At Ease for Workgroups version 3.0.2. (The only change to version 3.0.2 in this update is the correction of a rare problem with the login dialog box: if the login dialog box shows only the user list—not the workgroups list—and the user cancels out of the dialog box, the user list may disappear.)

Since this document gives information on updating both At Ease and At Ease for Workgroups, items that apply only to the workgroups product are indicated by "[WG]."

Requirements for Updating =====

Version 3.0 Already Installed -----

You can use the Updater only on a workstation that has version 3.0 or later installed. The Updater will not run if you have an older version (2.x or earlier) of At Ease installed. If you have an earlier version of At Ease, you should first update it to version 3.0, then use the Updater.

[WG] Updating Some or All Workstations -----

..TIL20661-At_Ease_3-0-3_Updater_Read_Me_11-96_(TA36229).pdf

The databases used by At Ease 3.0, 3.0.1, 3.0.2, and 3.0.3 are fully compatible. This means that if you are updating the workgroups version of At Ease, you can update some At Ease workstations on the network and not others. To benefit from all the enhancements in this version, however, you should update all At Ease workstations.

[WG] Using an AppleShare Server for At Ease for Workgroups

If your At Ease server is an AppleShare volume, all At Ease workstations on the network must have version 3.0 installed. If any workstation with an older version of At Ease tries to access the server, a message will appear reporting that the At Ease Preferences file is bad.

Updating Procedure

=====

Installation Options

There are two ways of updating one or more machines using At Ease: by using the Updater's floppy disk on each workstation or by installing the updated software over the network.

Files the Updater Needs to Locate

In most cases, the Updater attempts to locate and update the At Ease and At Ease Startup files automatically. If it cannot find either of these files, it will ask you for the location of the missing file. If you cannot find the file, you can click the Skip button to cancel the update, leaving your files untouched. If you have more than one copy of the setup program on your disk, the Updater will require that other copies be removed before the update can take place. You can have the Updater remove the other copies automatically, or you can cancel the update and remove them manually using the Finder.

Some administrators remove the setup program on certain workstations. On these workstations, the Updater will ask you to locate the setup program. If you are updating the workgroups version of At Ease and cannot locate the program, click the Skip button to bypass this request.

If you are updating the non-workgroups version of At Ease, it is highly recommended that you update the setup program when requested. Since the Updater will probably turn off At Ease on your workstation after it has completed the update, you will need an updated setup program in order to turn At Ease back on. Therefore, it is best not to skip the update.

Updating From the Floppy Disk

Follow these steps to update At Ease from the floppy disk:

1. Turn off At Ease on each workstation that you are updating. (See the user's manual for instructions on how to do this, if necessary.)
2. Insert the Updater disk.

3. Double-click to open the At Ease 3.0.3 Updater application.
4. Click Begin in the opening screen.
5. If the Updater cannot find a file it needs to update, a message appears asking you to locate that file. If you cannot find the file, click Skip to cancel the update.
6. If necessary, locate any missing files and start the update again.

[WG] Updating Over the Network

1. Copy the Updater application to an AppleShare server volume to which your At Ease workstations have access.
2. Make sure the application is locked. (To do this, select the Updater's icon, choose Get Info from the File menu, then click to put an X in the checkbox labeled "Locked.")
3. Turn off At Ease on each workstation you are updating.

Tip: Before updating any workstations on the network, you may want to turn off At Ease on all machines you will be updating by using the Update Computers feature. After you have updated your At Ease machines, you can turn At Ease on using this same feature. (See the user's manual for instructions, if necessary.)

4. Mount the server volume that contains the Updater application.
5. Double-click to open the Updater application.
6. Click Begin in the opening screen.

Using an Updated Copy of the Administration Program

Be sure to update the copy of At Ease Setup or At Ease Setup (Workgroups) that you use to administer At Ease to version 3.0.3. You should also remove any old copies of this program from your hard disk (or disks).

New Desktop Printer Extension

The Apple Extras folder on your Updater disk contains an updated version of the Desktop Printer Extension, an extension used by printer drivers for many newer models of printers. This version of the extension corrects problems that may occur when you are in the restricted Finder mode in At Ease.

You need to install this extension (version 1.03 or later) only if you are using an older version of it. If the Desktop Printer Extension is not already in the Extensions folder in your System Folder, or you have a newer version of the extension, do not install it. (Installing this extension will not affect computers that do not already have it, but the extension will occupy a small amount of memory.) If you are not sure what version of the extension you have,

select it and choose Get Info from the File menu.

To install the extension, follow these steps:

1. Open the Apple Extras folder on the Updater disk.
2. Drag the Desktop Printer Extension icon to the System Folder on your hard disk.
3. Click OK each time a message appears.

Changes Made In Previous Versions

=====

[WG] Using the Lock Startup Disk Feature

A bug in version 3.0.1 prevents the Lock Startup Disk feature from working correctly. Although the feature may appear to be active (indicated by a checkmark in the box next to the feature), it may not be active, in which case users will be able to view the startup volume by starting up from a floppy disk (or another volume). After updating your computers to version 3.0.3, you should first attempt to make sure the feature is disabled, quit the administration application, and then re-enable it. This will ensure that the latest update code is installed on your startup disk.

Note that this feature does not work on all Macintosh computers. You should read the section "Disk Security," later in this document, to find out about the compatibility of this feature with your computer.

System Startup Crashes While Using Open Transport

A change to the At Ease Startup extension in this version corrects a problem with system crashes on 68K machines that have Open Transport networking enabled. (This problem may also show up on certain PowerPC machines, notably the Power Macintosh 7500.)

[WG] Possible Hard Disk Corruption on IDE Hard Disks When Using the Lock Startup Volume Feature

This version of At Ease prevents a possible hard disk corruption that can occur when the Lock Startup Volume feature is activated on some newer computers using an IDE (ATA) internal hard disk. These computers include the Macintosh PowerBook 190, PowerBook 2300, and PowerBook 5300, but not the Macintosh Quadra 630. If this problem occurs, the computer displays a "sad Macintosh" icon when restarted.

Version 3.0.3 does not repair an already affected hard disk. If your hard disk has been corrupted, the At Ease-IDE Utility allows you to recover your hard disk. This utility is available on the Updater disk. See the At Ease-IDE Utility Read Me for additional information.

[WG] sub-launching Applications From Other Applications

For security, At Ease does not normally allow applications to open, or sub-launch, other applications. You can allow users to sub-launch applications in At Ease in one of two ways: (a) by installing the sub-launched application in the user's setup; or (b) by choosing the Application Preferences command from the Options menu in At Ease Setup and clicking to put an X in the checkbox labeled "Can be launched by other applications" for each sub-launched application.

Version 3.0.1 provides one simple way to allow sub-launching for all applications. The User Settings dialog box (which you open by choosing User Settings from the Security menu) now contains a checkbox labeled "Always permit sub-launches." When this checkbox is selected, At Ease always allows applications to open other applications. (This setting takes precedence over any setting in the Application Preferences dialog box.)

By selecting this option, an administrator avoids having to select individual applications for sub-launching. The checkbox can best be thought of as a "compatibility mode" feature that allows many applications to work better.

Login Procedure

To improve login speed, At Ease no longer saves panel or page information. Thus, when a user logs back in to the panels environment, she or he will always be brought to the first page of the "brown" panel.

[WG] At Ease Setup Changes

When At Ease Setup starts up, it now checks the internal databases. This check can take from a few seconds (when no users are logged in to the At Ease server) to almost a minute (on slow networks, when users are already logged in to At Ease). A message informs you that this check is taking place.

Clarifications

=====

Using Kid Pix Studio (Correction to Read Me for At Ease 3.0)

In the Read Me file for At Ease 3.0, the section "At Ease for Workgroups 3.0 and Kid Pix Studio" explains how to use At Ease 3.0 with Kid Pix Studio. The information about setting up subprograms with the Application Preferences command contains an error for the file "KPS 5." The file creator for "KPS 5" should be "Kîd5," not "Kîd4."

NOTE: To create the î character, hold down the Option key and type the letter i, then release the Option key and immediately type i again.

CD-ROMs and At Ease

An administrator can allow only certain CD-ROM discs to be used on a workstation. This feature applies only to CD-ROM discs that are used from the CD-ROM drive of the user's computer. It does not apply to discs in CD-ROM drives

that are connected to an AppleShare file server. These drives appear to At Ease as AppleShare volumes, not as CD-ROM drives.

Documents Created by Approved Applications

A document that is available to users may be opened if the application that created the document is on the "approved" list of applications. At Ease creates this list by searching locations to which the users of a setup have access, including the setup folder, the Apple Menu Items folder, the Control Panels folder, and the Startup Items folder.

If any documents (or stationery pads) exist in those locations, At Ease assumes that the application that created them is also approved. For example, if the Apple Menu Items folder contains a SimpleText stationery pad, and users of that setup have access to "other items" in the Apple menu, those users will be able to open any SimpleText documents, no matter where the documents are located. This is true for both panels and for the restricted Finder.

[WG] Server Mounting in At Ease

The administrator decides whether users of a particular setup can (a) start up with the last server volumes used or (b) use the Chooser's marked startup volumes instead. At Ease permits only one of these options for a given setup.

This option can be set in At Ease Setup (Workgroups) by selecting a setup and then putting an X in the checkbox labeled "Always remember the user's last-used AppleShare logins." When the checkbox is selected, any AppleShare volumes mounted at logout will be remembered by At Ease and remounted the next time the user logs in. When the checkbox is not selected, any server volumes that were set in the Chooser to connect at startup will mount with the same privileges as were set with the Chooser. Because this feature operates on a user-by-user basis, the setting must always be the same for any user who belongs to multiple setups.

If a server has volumes (such as a CD-ROM drive) to which you want users to have access when they log in, you should leave the "remember" checkbox unselected and use the Chooser to set up the volumes to be mounted on each workstation. You must do this on each computer because the AppleShare information is stored in the System Folder of the workstation, not on the server volume.

[WG] Disk Security

The disk security feature in At Ease prevents users from starting up a workstation from a floppy disk and then accessing the startup disk. This feature was introduced in At Ease 2.0. In version 3.0, you set this feature using a checkbox labeled "Lock Startup Volume" in the User Settings dialog box.

If At Ease detects that the security option cannot be used on a workstation, it dims the checkbox for this option. There are two primary reasons why the Lock Startup Volume option cannot be used:

- Unknown hard disk driver

If you have reformatted your startup disk with a non-Apple hard disk driver, the disk security option may not work with that driver. If the Lock Startup Volume checkbox is dimmed, please contact the driver software manufacturer to see if that disk driver is compatible with this At Ease feature.

- Non-partitioned IDE drives

Some Macintosh computer models use a hard drive mechanism called IDE (or ATA) for the startup disk. (Computers that use this drive type include the Power Macintosh 5200, 5300, and 6200, and the Macintosh PowerBook models 150, 190, and 5300.)

The security in At Ease requires that the startup hard disk drives be partitioned. All SCSI hard drives are partitioned at the factory, and in the future the IDE drives will be partitioned. But for current Macintosh models with IDE drives that are not partitioned, the disk security will work only if the IDE drive is reformatted using a partitioned driver. One program that can partition these drives is Drive7, from Casa Blanca Works. (The IDE hard drive must be reformatted in order to partition it. You cannot update the driver on the disk.)

At Ease and File Sharing

Turning on file sharing on a computer using At Ease version 3.0 or 3.0.1 is not recommended. At Ease attempts to turn off file sharing when a restricted Finder user starts up. You should be sure that file sharing is turned off (by checking in the Sharing Setup control panel).

[WG] Maximum Number of Connected Users on an At Ease Server

Because At Ease can open up to four files on the server for each machine that is in the login screen, it is possible that some versions of AppleShare will not allow as many machines to connect as may be indicated in the AppleShare Admin File Server Preferences dialog. Version 4.2 of AppleShare should eliminate this restriction.

Bypassing At Ease at Startup on Certain Power Macintosh Models

Certain newer Macintosh computers using system software version 7.5.2 may allow users to bypass At Ease by holding down the Shift key when starting up. This problem has been fixed in system software version 7.5.3, but you can also prevent users from bypassing At Ease by clicking to put an X in the checkbox labeled "Don't allow shift key at startup to disable extensions" in the setup application. You may need to do this for each machine on which the problem has occurred.

At Ease and RAM Doubler

RAM Doubler version 1.6 is not compatible with At Ease 3.0.1. The computer may freeze when users launch applications from At Ease if RAM Doubler is installed. Apple recommends that customers contact Connectix Corporation to determine whether an updated version of RAM Doubler is available. For more information, contact Connectix at 800-950-5880 or 415-571-5100.

[WG] At Ease and Hard Disk Toolkit (HDT)

In rare cases, if your internal hard disk has been formatted with certain versions of the Hard Disk Toolkit (HDT), activating the Lock Startup Volume feature in At Ease for Workgroups may prevent your internal disk from starting up. If your internal hard disk has been formatted using HDT, you should back up the data on your hard disk before activating the Lock Startup Volume feature. Because all internal hard disks on computers sold by Apple are formatted using Apple software, not HDT, you will not experience this problem unless you have reformatted the internal hard disk with HDT. To determine if your internal hard disk has been reformatted with the Hard Disk Toolkit, select the hard disk, choose Get Info from the File menu, and check the Info dialog box for "<name of hard drive>, FWB."

At Ease and QuickMail

When a user attempts to save a file from QuickMail, he or she may be prompted to save the file in a location other than the user's documents folder. If the user clicks Cancel and then chooses Save again, the file will be saved in the user's documents folder.

Major Problems Corrected in Versions 3.0.1-3.0.3

=====

Users Visible After Update From Version 2.x

After an update from version 2.x to version 3.0, users already registered in At Ease occasionally did not show up in the setup application. (The setup window showed setups, but no users.) Users should appear after the automatic update from 2.x to this version (3.0.3).

No Report of Damaged Preferences File at Login

On some networks (especially if workstations were not turned off periodically), a message appeared when a workstation logged in indicating that application preferences might be damaged, even though other computers on the network were working properly. Restarting the server usually cleared up this problem. The problem has been fixed in versions 3.0.1 or later.

[WG] Shorter Login or Logout Times on Large Systems

In server-based At Ease networks with many users, workstations took an excessively long period of time to log in or out of the system. In versions 3.0.1 and later, the login and logout times have been reduced for very large networks. Apple recommends that you use version 4.2 (or later) of AppleShare if you are encountering problems with long login or logout times.

[WG] Documents Panel Remains Visible

When an At Ease user was logged in, a message occasionally appeared indicating that the server had been disconnected, and the documents panel disappeared, even

though the server volume had not actually been disconnected. This problem has been corrected.

[WG] Setup Application Correctly Recognizes Setups

The setup application occasionally interpreted one or more setups as locked, so that they could not be modified by the administrator. This problem has been corrected.

Virex Incompatibility Corrected

The Virex application was not compatible with At Ease 3.0. If both programs were installed, the user experienced a system crash when starting up the computer. This problem has been corrected.

Items in the Apple Menu Remain Visible

Occasionally some aliases in the Apple menu were deleted when a restricted Finder user returned to the login screen. This problem has been corrected.

[WG] Servers Mount Correctly

Server volumes selected in the Chooser occasionally could not mount when a user logged in. This problem has been corrected.

Note: This feature works only if the user's setup has the "Always remember the user's last-used AppleShare logins" option turned off. See the user's manual for instructions.

[WG] Import Users Function Works Correctly

A number of changes were made to the "import users" function. A problem that prevented the cancellation of importing when many errors occurred has been corrected.

[WG] Middle-Level Administration

Middle-level administrators can now add users to setups that they own.

At Ease-IDE Utility Read Me (1/97)

=====

Article Created: 21 November 1996
Article Reviewed/Updated: 17 January 1997

TOPIC -----

This article is the At Ease-IDE Utility ReadMe file.

DISCUSSION -----

At Ease-IDE Utility

The Problem

This utility program fixes a problem that may appear if you are using At Ease for Workgroups 3.0 or 3.0.1 and the following conditions are true:

- the At Ease administrator has set the "Lock startup volume" option,
- the Macintosh running At Ease is equipped with an IDE internal hard drive and a recent version of the driver software. (This includes the PowerBook 190, PowerBook 2300, and PowerBook 5300.)

In these circumstances, turning on the computer and attempting to boot from the internal hard disk will cause a "sad Mac" window to appear. You will not be able to get to the At Ease logon screen or to the Finder.

The Solution

If this occurs, follow these steps:

1. Insert a bootable floppy disk that contains the At Ease-IDE Utility and do a restart while holding down simultaneously the Command-Shift-Option-Delete keys. It will take some time before the Finder appears. (See instructions at the end of this document for obtaining such a disk if you don't have one. It is also possible to connect a bootable external hard drive containing the At Ease-IDE

Utility and, in the same manner, start up from that drive.)

2. If you see a dialog asking if you want to rebuild the desktop, click on cancel.
3. Once you have booted and are in the Finder, run the At Ease-IDE Utility. (Note that your internal hard disk will not be visible on the desktop.)
4. Choose "Restart" from the Special Menu in the Finder and allow the floppy disk to be ejected so that you are booting from the internal hard disk.
5. If At Ease is on, you will go to the At Ease logon screen as usual. (Note that if your computer's startup disk has been locked by At Ease for Workgroups, it will still be locked after running the At Ease-IDE Utility.)
6. If At Ease is off, you will go to the Finder.
7. Immediately upgrade to At Ease for Workgroups version 3.0.2 or later. (See below for information on obtaining version 3.0.2).

The data on your internal hard disk will not be affected by this problem or by running the At Ease-IDE utility.

On At Ease for Workgroups 2.x versions, IDE (ATA) drive locking was not supported, so the problem will not appear. You should still consider upgrading to At Ease 3.0.2 or subsequent versions.

Obtaining a Bootable Floppy Disk With the At Ease-IDE Utility

1. If you have a Disk Tools disk for the computer with the problem, you can move the At Ease-IDE Utility to that disk -- there should be room -- and then startup from that disk.
2. If you have access to any of the following on-line services, you can download a bootable disk image called "At Ease-IDE Utility Disk" at the following online locations:
 - America Online - keyword: applecomputer
 - CompuServe - GO APLSUP
 - Internet -
 - Worldwide Web: <<http://www.info.apple.com/swupdates>>
 - ftp: <<ftp://ftp.info.apple.com>>
3. If you do not have on-line access, you can obtain the At Ease-IDE Utility by calling 800-SOS-APPL, or 800-767-2775. (Available in the US only.)

Obtaining At Ease For Workgroups 3.0.2 Update

You can obtain the At Ease for Workgroups 3.0.2 update from any of the above

on-line services using the same path.

LaserWriter Printers: Rename & Turning Off Startup Page (11/96)

Revised: 11/21/96
Security: Everyone

LaserWriter Printers: Rename & Turning Off Startup Page (11/96)

=====

Article Created: 21 November 1996

TOPIC -----

I have a PostScript Apple LaserWriter and would like to change the name that shows up in the chooser under "select a LaserWriter". Also, I'd like to turn off the startup page.

DISCUSSION -----

In order to change the LaserWriter name, your LaserWriter printer needs to be a network PostScript printer and its current name is listed in the Chooser when selecting the LaserWriter or LaserWriter GX icon. You cannot change the name of the LaserWriter Select 310, which is a PostScript printer, because it is not a networkable printer, and does not broadcast a name through AppleTalk.

To change the name of the printer you will need either a copy of LaserWriter Utility or Apple Printer Utility. These utilities are on the first disk of the printer disk set, or you can install them with the custom install feature. If you are running system 7.5.x, you can custom install either utility directly using the system 7.5 installer.

Using LaserWriter Utility To Rename a Printer

=====

To access the printer using LaserWriter utility, you must already have your LaserWriter properly configured in the Chooser. The easiest way to determine if your printer is properly configured is to print to the printer. If you can print to the LaserWriter printer, then it is properly configured.

Step 1

Launch the LaserWriter Utility.

The LaserWriter Utility tries to make a connection to the current printer when the initial screen appears. If the connection is successful, the splash screen disappears and three menus appear in the Menu bar.

If the LaserWriter Utility does not make a connection, make sure you have the proper printer selected in the Chooser, and verify that you can print to the printer.

Step 2

Choose Name Printer from the Utilities menu.

Step 3

Type the new name for the printer.

Step 4

Click the Rename button.

Using LaserWriter Utility To Turn Off The Startup Page

=====

Step 1

Launch the LaserWriter Utility.

The LaserWriter Utility tries to make a connection to the current printer when the initial screen appears. If the connection is successful, the splash screen disappears and three menus appear in the Menu bar.

If the LaserWriter Utility does not make a connection, make sure you have the proper printer selected in the Chooser, and verify that you can print to the printer.

Step 2

Choose Set Startup page from the Utilities Menu.

A dialog appears allowing you to select Startup page on or off.

Step 3

Choose if you want the Startup page on or off.

Step 4

Click OK

Using Apple Printer Utility (1.x)

=====

To access the printer using Apple Printer Utility, you must already have your

LaserWriter properly configured in the Chooser. The easiest way to determine if your printer is properly configured is to print to the printer. If you can print to the LaserWriter printer, then it is properly configured.

Step 1

Launch the Apple Printer Utility.

A window appears with a list of printers. This is similar to the way printers appear in the Chooser.

Step 2

Select the printer you want to connect to.

Step 3

Click the Open Printer button.

A status window appears informing you that it is checking the status of your LaserWriter printer. After this is complete, a window with all the printer information appears. The information is subdivided into two sections, printer information and printer preferences.

Step 4

Click the triangle next to printer preferences to set the startup page or rename the printer. Steps 5 through 7 explain how to rename a LaserWriter printer. Steps 8 through 10 explain how to change the startup page status.

To rename the LaserWriter printer:

Step 5

Click the triangle next to Name.

The name of the current printer appears.

Step 6

Type over the current name of the printer.

Step 7

Click the Send button at the top of the window.

Changes will not be made unless you click the Send button.

To change the Startup Page status:

Step 8

Click the triangle next to Startup Page

Most printers will have a check box for Print a startup page each time the printer is turned on.

Step 9

Click the check box to change the status.

An X in the box indicates a startup page prints when the printer is powered on. The default is to generate a startup page.

Step 10

Click the Send button at the top of the window.

Changes will not be made unless you click the Send button.

Note:

Some printers such as the Color LaserWriter 12/600 PS and Color LaserWriter 12/660 PS have more than one test page. You can select which pages, if any, you want to print at startup.

Using Apple Printer Utility (2.x)

=====

To access the printer using Apple Printer Utility, you must already have your LaserWriter properly configured in the Chooser. The easiest way to determine if your printer is properly configured is to print to the printer. If you can print to the LaserWriter printer, then it is properly configured.

Step 1

To access the printer using Apple Printer Utility, first ensure you have a working connection to the printer. Next, launch the Apple Printer Utility application.

Step 1

Launch the Apple Printer Utility.

A window appears with a list of printers. This is similar to the way printers appear in the Chooser.

Step 2

Select the printer you want to connect to.

Step 3

Click the Open Printer button.

A status window appears informing you that it is checking the status of your LaserWriter printer. After this is complete, a window with all the printer information appears. The information is subdivided by category.

Steps 4 through 6 explain how to rename a LaserWriter printer. Steps 7 through 9 explain how to change the startup page status.

To rename the LaserWriter printer:

Step 4

Click the triangle next to Name.

The name of the LaserWriter printer appears.

Step 5

Type over the current name of the printer.

Step 6

Click the Send button to send the new name to the printer.

Changes will not be made unless you click the Send button.

To change the Startup Page status:

Step 7

Click the triangle next to Startup Page.

A check box for Print a startup page each time the printer is turned on appears.

Step 8

Click the check box to change the status.

An X in the box indicates a startup page prints when the printer is powered on. The default is to generate a startup page.

Step 9

Click the Send button at the top of the window.

Changes will not be made unless you click the Send button.

Note:

Some printers such as the Color LaserWriter 12/600 PS and Color LaserWriter 12/660 PS have more than one test page. You can select which pages, if any, you want to print at startup.

LaserWriter Driver 8.x: LW Icon Isn't in Chooser (11/96)

Revised: 11/21/96
Security: Everyone

LaserWriter Driver 8.x: LW Icon Isn't in Chooser (11/96)

=====

Article Created: 21 November 1996

TOPIC -----

I am installing my LaserWriter printer and the instructions say to select LaserWriter 8 in the chooser. I have installed the software multiple times, but there is still nothing in the chooser that reads LaserWriter 8.

DISCUSSION -----

Check the listing of icons in the Chooser for a printer Labeled LaserWriter GX. If you see this printer active, you have QuickDraw GX installed and active. When QuickDraw GX is active, non-GX printer drivers, such as the LaserWriter 8 are hidden, and only the QuickDraw drivers are available. You can select and use the LaserWriter GX icon instead of the LaserWriter 8 driver if you want. For more information about Quickdraw GX consult the documentation that came with your system software, and the manual that came with your printer.

Apple Internet Connection Kit 1.1.5 ReadMe (11/96)

Revised: 11/22/96
Security: Everyone

Apple Internet Connection Kit 1.1.5 ReadMe (11/96)

=====

Article Created: 21 November 1996

TOPIC -----

This article is the Apple Internet Connection Kit (AICK) 1.1.5 Read Me file.

DISCUSSION -----

Important Information About the Apple Internet Connection Kit

Before you install the Apple Internet Connection Kit, read the following information.

Getting Help for Installing and Using Your Internet Connection Kit

Apple will assist you with the installation and setup of the Apple Internet Connection Kit. Our specially trained telephone support staff can assist you with information on:

- installation
- registration
- configuration

Once you have selected and registered with an Internet service provider, the provider will be able to assist you with:

- basic product use
- applications questions or issues
- billing issues
- connection questions and problems

If you are accessing the Internet over a LAN, contact your network administrator for help in setup and use.

Telephone support is available Monday through Friday (excluding holidays) from 6 a.m. to 6 p.m. Pacific Standard Time. In Canada, hours are 8 a.m. to 8 p.m.

Eastern Standard Time. For the appropriate phone number to call for support, see the support materials that came with your product.

Apple provides an excellent online reference source for technical information: the Apple Tech Info Library. You can search through thousands of articles on Apple products, past and present, updated regularly by Apple Support personnel. The Apple Tech Info Library (TIL) is available on the Internet (<http://www.info.apple.com/til.html>), AppleLink (Support -> Tech Info Library), and CompuServe (GO APLTIL).

System Requirements

- Power Macintosh or Macintosh computer with a 68030 microprocessor or greater
- Macintosh system software version 7.5 or later
- MacTCP or Open Transport; if you are using Open Transport, you must use version 1.0.8 or later (version 1.1 is strongly recommended)
- 8 megabytes (MB) of random-access memory (RAM), 12 megabytes is recommended; you must turn on virtual memory when using less than 12 megabytes of RAM
- 21 MB hard disk space

Open Transport Users

Open Transport version 1.1 is strongly recommended for use with the Apple Internet Connection Kit. You must use Open Transport version 1.0.8 or later.

IMPORTANT: If you do not use the Dialer and you are using a version of Open Transport earlier than version 1.1, you must restart your computer if you change Internet providers or TCP/IP settings before you can connect to the Internet again.

Apple's System 7.5 Update 2.0 will install Open Transport version 1.1 for you. Look for information about this update and others on Apple forums and Apple Web sites on the Internet.

Installing and Setting Up the Internet Connection Kit

Make sure you've quit all open applications before you attempt to install the Internet Connection Kit.

To install the Apple Internet Connection Kit on your hard drive, double-click the Installer icon and then follow the instructions on your screen. Click the Apple Internet Dialer icon in the Launcher window and follow the instructions that appear on-screen.

If you already have Netscape installed on your computer before you install the Internet Connection Kit, a Backup Folder is created automatically when you install the Internet Connection Kit. The bookmarks that you have created using your previous version of Netscape will be saved in the Backup Folder.

IMPORTANT: Internet applications such as Netscape Navigator™ must have TCP properly configured to function properly. Use the Dialer to ensure that TCP is

configured correctly whether you are using the automatic registration process or manually defining your Internet Service Provider.

Problems While Registering

When you register with a service provider by using the Dialer, the Dialer will gather some personal information from you (such as your name and address) and then it will connect to the registration server and launch Netscape Navigator. If your network connection drops while you are trying to register or there is some problem you encounter with the registration server, you need to quit the Netscape Navigator application. Once you quit, the Dialer will offer you the option to Cancel or Continue the registration process. Click Continue to try to register again immediately, or click Cancel and try later.

Using or Deselecting the Launcher

The Launcher window provides an easy way to open programs and other items; you click a Launcher button once to open the item it represents. The Launcher is set to open automatically after you've installed the Internet Connection Kit.

If you don't want to use the Launcher interface for accessing the applications in the kit, open the General Controls control panel and deselect (remove the X) the "Show Launcher at startup time" option.

Saving Internet Service Provider Registration Information

You will be asked to write down your user name and password after registering with an Internet service provider. You can write the information down on paper, or you can retain this information on your computer by following these steps:

1. Press Command-Shift-3 to take a screen shot of what is on your monitor screen; the screen shot will be saved on your hard drive with the name "Picture 1," and the file can be opened with many applications, including SimpleText.
2. Select the image and copy it into your Scrapbook.

If you forget to write the information down, you will need to contact your service provider to get that information, should you need it. Apple will not be able to assist you with recapturing this information.

If You Already Have an Internet Service Provider

If you already have an Internet service provider, use the Define New Provider command in the Provider menu. You should call your service provider to get the setup information to complete the dialog box that appears.

Connecting to a News Server for the First Time

Connecting to a news server for the first time or switching service providers can take from one minute to more than 20 minutes, depending on your Internet service provider's configuration. If there is a large number of newsgroups to download from the news server to which your service provider has enabled you to connect, the initial connection time could be quite lengthy. Subsequent

connections are likely to be much quicker.

Backing Up Your Internet Service Provider Information

Once you have successfully registered with an Internet service provider, it is recommended that you back up the preferences and settings in case you need to restore them. You can do this by opening the Dialer and selecting Backup Provider Information from the File menu.

Using the Correct Version of MacPPP

Apple Internet Connection Kit requires version 2.5 of MacPPP. If you have a different version of MacPPP installed on your machine, you should replace it with the version provided in your package. The Apple Internet Connection Kit Installer does this for you automatically. Older versions of MacPPP, including MacPPP 2.1.4 and 2.2, are not compatible with the Internet Connection Kit, and should not be used with this product. Other implementations of PPP are not supported.

Using SLIP Software

The Apple Internet Dialer is configured to use the MacPPP version that is included with this kit; it will not work with InterSLIP software. InterSLIP software is included with the Internet Connection Kit as a convenience, but it will not work with the Dialer. If you need to use a SLIP connection, contact your Internet service provider for instructions on setting up and configuring your system using SLIP software.

Troubleshooting Insufficient Memory Messages

If you are attempting to run several Internet applications simultaneously and you see a message indicating that your system does not have enough memory to run an application (or if you see an insufficient memory message the first time you attempt to use the Dialer to register with an Internet service provider), you can try one of the following:

- Close all unnecessary applications.
- Turn on virtual memory (VM); see Macintosh Guide for details about how to use VM.
NOTE: For best performance, never set VM to more than twice the amount of physical RAM (if you have an 8 MB system, VM should be no more than 16 MB).
- Purchase more RAM.

Restoring Your LAN Configuration

If you inadvertently installed the Dialup configuration over your existing Internet LAN configuration, you can restore your settings by following the steps provided in one of the sections below, as appropriate for your MacTCP or your Open Transport system:

If you have MacTCP:

1. Open the Internet Connection Kit folder.
2. Open the folder called Backup Folder.
3. Open your System Folder next to the Backup Folder.
4. Copy the MacTCP Prep file from the Backup Folder into the Preferences folder of your System Folder.
5. Restart your machine.

If you have Open Transport:

1. Open the TCP/IP control panel.
2. Choose Configurations from the File menu.
3. In the list of configurations, click Default to highlight it (if it is not already).
4. Click the Make Active button.
5. Close the TCP/IP control panel.

What Is Installed in Your System Folder?

After doing an Easy Install, the Apple Internet Connection Kit puts the following items in various places in your System Folder:

- Apple Guide 2.0.2
- ObjectSupportLib 1.0.2 (AppleScript document)
- PPP 2.5 (MacPPP) extension and (if necessary) PPP Preferences (Preferences folder)
- MacTCP 2.0.6, MacTCP Prep, MacTCP TokenRing extension, Hosts file (all are installed only if you do not have Open Transport)
- Internet Config extension and Internet Config Preferences
- Internet Dialer Folder (Preferences folder)
 - Modem Information
 - Internet Dialer Prefs
 - reg server
- Launcher 2.8, and Launcher Preferences
- QuickTime 2.1, QuickTime Musical Instruments, and QuickTime PowerPlug (on PowerPC-based computers only)
- Sound Manager 3.1, Sound control panel 8.0.5
- RealAudio Daemon
- Netscape preferences (Preferences folder)
- additional fonts

LW Select 360: Paper Pulls from Multipurpose Tray (11/96)

Revised: 11/21/96
Security: Everyone

LW Select 360: Paper Pulls from Multipurpose Tray (11/96)

=====

Article Created: 21 November 1996

TOPIC -----

I have a LaserWriter Select 360 and every time I try to print, the printer indicates it is out of paper. However, there is plenty of paper in the paper cassette. If I put paper in the multipurpose tray it prints from there instead, even though I have selected autoselect in the print dialog. I am also having a problem with my startup page printing off center.

DISCUSSION -----

The LaserWriter Select 360 paper cassette allows you to use a variety of paper sizes by adjusting the cassette to meet the paper sizes used. In order to adjust the cassette, you must extend or retract a blue guide in the center of the tray to meet the top of the paper. When adjusted properly this guide clicks into place against a marking on the tray that specifically indicates what the paper size is. If this clip is damaged, the cassette indicates the wrong paper size to the printer.

When selecting autoselect from the print dialog, the Mac OS checks the printer to see what paper sizes are installed and compares them to what is selected in page setup, for example US Letter. If the printer indicates something other than US Letter paper in the cassette and there is no other source for 8.5 x 11 paper, the printer assumes you have put 8.5 x 11 in the multipurpose tray and pull from there. If there is no paper in the multipurpose tray an out of paper message appears.

When the clip is moved to adjust for paper size, a white spindle on the outer right back of the tray rotates to trigger a response from the printer. If the clip is seated properly in the cassette tray, the spindle appears as follows:

```
----->          three grooves pointing one direction
----->
----->
<-----          followed by three grooves pointing the other direction
```

<-----

<-----

followed by a blank area the size of three grooves

<----- followed by three grooves pointing the same direction

<-----

<-----

If it appears in any other configuration, adjust the cassette one more time to be sure it is seated properly. If so, then the cassette will need to be repaired or replaced by your local Apple service provider.

Why The Printer Indicates the Wrong Paper Size

Essentially the peg on the bottom of the blue clip has come unseated from the white hook which connects it to the rotating spindle. Because of this, the spindle gives an incorrect reading and the printer believes that there is some other paper type besides U.S. Letter in the tray. This clip can be reseated by disassembling the tray, but this should only be done by an Apple Authorized Service Provider to avoid damaging the tray in a manner that is not covered by warranty.

Power Macintosh 4400: Black Screen & Video Mirroring (11/96)

Revised: 11/22/96
Security: Everyone

Power Macintosh 4400: Black Screen & Video Mirroring (11/96)

=====

Article Created: 22 November 1996

TOPIC -----

I am using video mirroring with my Macintosh Performa 4400. However, whenever I restart or shut down the computer, both monitors appear black or gray when the computer starts up again. How can I prevent this from happening?

DISCUSSION -----

This appears to be an issue with the system software on the Power Macintosh 4400. Apple plans on resolving this issue in a future version of the Mac OS. In the interim, you can use one of the following workarounds.

* If you no longer want to use video mirroring, follow these steps:

Step 1

Shut down the computer.

Step 2

Unplug the monitor cable that is connected to the PCI video card.

Step 3

Restart the computer.

* Or, if you still want to use video mirroring after restarting, follow these steps:

Step 1

Before shutting down or restarting the computer, open the Monitors & Sound

control panel.

Step 2

Turn off Video Mirroring in the Monitors & Sound control panel.

Step 3

Restart or shut down your computer.

Step 4

Once the computer has restarted, turn Video Mirroring back on in the Monitors & Sound control panel.

LW Printers: Using a Multipurpose Tray w/ QuickDraw GX (11/96)

Revised: 11/22/96
Security: Everyone

LW Printers: Using a Multipurpose Tray w/ QuickDraw GX (11/96)

=====

Article Created: 22 November 1996

TOPIC -----

I am printing to a LaserWriter printer using Quickdraw GX and cannot find an option for the multipurpose tray in the print dialog box, or in tray options.

DISCUSSION -----

There is no multipurpose tray option within QuickDraw GX. There is a selection for manual feed in the print dialog. You can use this option with minor setting changes to obtain the same functionality as the multipurpose Tray option.

Using the QuickDraw GX Manual Feed With A Multipurpose Tray

=====

Click on the desktop printer icon. A Printing menu appears in your menu bar next to the Special menu. If a Check appears next to Show Manual Feed Alerts, you need to disable the alert messages, by choosing Show Manual Feed Alerts. If you do not have a check next to the Show Manual Feed Alerts, manual feed alerts is already disabled, so you can use your multipurpose tray without making any changes.

The only PostScript LaserWriter you cannot use this workaround with is the LaserWriter Select 310 printer. There is no manual feed disable feature available with this printer.

Avid Cinema: Don't Adjust Memory Requirements (11/96)

Revised: 11/22/96
Security: Everyone

Avid Cinema: Don't Adjust Memory Requirements (11/96)

=====

Article Created: 22 November 1996

TOPIC -----

After I raised the memory allocation for the Avid Cinema application the video stutters and there seem to be other QuickTime performance problems. What is wrong?

DISCUSSION -----

Adjusting the memory requirements of the Avid Cinema application through the "Get Info" window can have adverse effects on the performance of the application. For best results, do not adjust the Preferred Size or Minimum Size in the "Get Info" window. With virtual memory off, the correct settings for Avid Cinema 1.0 should be:

Minimum Size: 10000K
Preferred Size: 12000K

Network Server 500/700: User Environment Variables (4/97)

Revised: 4/16/97
Security: Everyone

Network Server 500/700: User Environment Variables (4/97)

=====

Article Created: 22 November 1996
Article Reviewed/Updated: 16 April 1997

TOPIC -----

I am trying to set environment variables unique to each user on my Network Server. I am modifying the ".profile" file for each user, but the file is never run when I log into CDE (Common Desktop Environment) so none of the variables are set in the graphical environment. However, if a user Telnet into the machine, the variables are set.

DISCUSSION -----

The environment variables for CDE are stored in the ".dtpfile" file. This file is run whenever a user logs into CDE, and is stored in the users \$home directory (ksh environment). The ".profile" script is only used for shell logins, such as Telnet or rlogin.

However, you can modify your .dtpfile to invoke your .profile if you are logging in to CDE and need to set your paths from the ".profile". To modify your .dtpfile, uncomment the last line in the .dtpfile (remove the "#" from the line DTSOURCEPROFILE=true).

Library paths will not be set, however, so you will need to modify the .dtpfile for setting these.

Article Change History:
16 Apr 1997 - Added section on .dtpfile

PC Exchange 2.0.5: Trouble Reading Large DOS Volumes (11/96)

Revised: 11/25/96
Security: Everyone

PC Exchange 2.0.5: Trouble Reading Large DOS Volumes (11/96)

Article Created: 22 November 1996

TOPIC -----

I am having trouble reading all the information from a DOS formatted SyQuest 270 cartridge with PC Exchange v2.0.5. PC Exchange reads the first 200 MB of data, then continues trying to read the cartridge for varying amounts of time depending on how much information remains on the cartridge, then just displays the information it was able to read.

A dialog informs me that the disk is full, then shows the directory. However, the directories are incomplete. SyQuest informed me that PC Exchange has trouble reading DOS formatted cartridges with over 200 MB of data. Is this correct?

DISCUSSION -----

Yes, PC Exchange has trouble working with large DOS volumes. When PC Exchange runs out of memory it will display a truncated list of files. This limit varies depending on the number of files on the volume. A smaller number of large files will be displayed properly and a larger number of small files will be truncated.

This should be fixed in a future version of PC Exchange.

Elementary Curriculum Connections Kit - The Cruncher (11/96)

Revised: 11/25/96
Security: Everyone

Elementary Curriculum Connections Kit - The Cruncher (11/96)

=====

Article Created: 25 November 1996

TOPIC -----

My school is using The Cruncher v.1.21C, a CD-ROM title, that shipped with the Elementary Curriculum Connections Kit for a Power Macintosh 5260/120. Our school is using the Spreadsheet portion of the application. Every time we select a cell and choose the Cell Attributes... command from the Format menu, we receive a message that says, "Sorry, a system error occurred. 'The Cruncher' error type 11".

This behavior happens with both System Software 7.5.3 and System Software 7.5.5 on our computers. How can we fix this issue?

DISCUSSION -----

According to Davidson & Associates, Inc., the developer of The Cruncher, this is a known issue with version 1.21C. Users can workaroud this issue by turning off the Modern Memory Manager in the Memory control panel and restarting their computer. After restarting, users should be able to change Cell Attributes normally. Davidson is currently working with Apple to correct this.

For the latest information regarding The Cruncher users should contact Davidson & Associates directly. The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

WorldScript Power Adapter Extension: What it is Used For? 11/96

Revised: 11/25/96
Security: Everyone

WorldScript Power Adapter Extension: What it is Used For? 11/96

=====

Article Created: 25 November 1996

TOPIC -----

I a Power Macintosh computer, but do not have any of the language kits installed. Can I remove the WorldScript Power Adapter extension?

DISCUSSION -----

Even if you do not have a language kit installed, you should leave the WorldScript Power Adapter extension in your Extensions folder. There is a misconception that this extension is only used with language kits. However, the WorldScript Power Adapter extension is used with both Roman and non-Roman languages.

The WorldScript Power Adapter extension is poorly named; it is more closely related to the Macintosh Script Manager. It contains native PowerPC implementations of many of the general script utilities, including routines used by Roman programs, not just non-Roman. These routines include anything that has to do with laying out and drawing text in QuickDraw. When the WorldScript Power Adapter extension is not installed on a Power Macintosh computer, the routines are emulated, so you are not getting the maximum performance from your computer.

Reinstalling the WorldScript Power Adapter
=====

If you have removed the WorldScript Power Adapter extension and want to reinstall it, you need to reinstall the entire Mac OS System 7.5.x software. The Custom Install option does not allow you to install just the WorldScript Power Adapter. The WorldScript 1.1 Updater software posted on Apple's software update sites, updates the WorldScript I and WorldScript II extensions, but it does not install the WorldScript Power Adapter.

This article appeared in the 25 November 1996 issue of the Information Alley.

Macintosh Performa 6400: QuickDraw GX Location (11/96)

Revised: 11/25/96
Security: Everyone

Macintosh Performa 6400: QuickDraw GX Location (11/96)

=====

Article Created: 25 November 1996

TOPIC -----

I want to install QuickDraw GX on my Macintosh Performa 6400 computer. I have searched my hard disk but could not find the software. I used the Restore All Software option on the Macintosh Performa 6400 Restoration CD, but it still did not install QuickDraw GX. How can I get QuickDraw GX?

DISCUSSION -----

As you have discovered, QuickDraw GX is not installed using the Restore All Software option on the Macintosh Performa 6400 Restoration CD. Instead, you must open the several folder to find the installer for QuickDraw GX.

The path for the QuickDraw GX software is:

Performa CD -> Hard Disk Files -> Apple Extras Files -> System Software Extras (scroll down to see it) -> QuickDraw GX.

Other software in the System Software Extras folder includes; QuickDraw 3D, QuickDraw 3D extras, PowerTalk, PowerTalk Extras, Sound control Panel, and Text-to-Speech.

Color StyleWriter 2200: Communication Settings (11/96)

Revised: 11/25/96
Security: Everyone

Color StyleWriter 2200: Communication Settings (11/96)

=====

Article Created: 25 November 1996

TOPIC -----

What are the communication specifications (baud rate, parity, start and stop bits) on the Color Stylewriter 2200?

DISCUSSION -----

The data format for the Color Stylewriter 2200 is:

Asynchronous serial
1 Start Bit
8 Data Bits
1 Stop Bit
No Parity

The same data format is used for transmit and receive.

At Ease 4.0: Frequently Asked Questions (11/96)

Revised: 11/26/96
Security: Everyone

At Ease 4.0: Frequently Asked Questions (11/96)

Article Created: 26 November 1996

TOPIC -----

This article contains answers to frequently asked questions (FAQ) about At Ease 4.0.

Questions in this FAQ

-
- 1) Is there any way to shorten the list of At Ease 4.0 users, or group them so a user does not have to scroll through a potential list of 4,000 users?
 - 2) Can At Ease workstations recognize a CD-ROM tower connected to a server?
 - 3) When I use the At Ease Administration program to add a workstation to my approved list I got the following error, "Could not write the workstations list out to the server." Where is the workstation list and how can I fix this?
 - 4) Question: Do you have to install At Ease to use the Network Assistant software?
 - 5) Do teacher handouts affect students disk quota?
 - 6) With At Ease 4.0, I cannot select a printer for printer quotas unless a desktop printer file exists. How can I get a desktop printer file for my non-Apple printer?

DISCUSSION -----

- 1) Question: Is there any way to shorten the list of At Ease 4.0 users, or group them so a user does not have to scroll through a potential list of 4,000 users?

Answer: One way is to group users is by user type. To change the list use the show option at the login screen and select only Users, Workgroup Administrators, or Administrators. The names on the login screen then appear in alphabetical

order. Users can move closer to their name by pressing the first two or three letters of their name which will bring them closer to their name without scrolling through the entire list.

Another option would be to change the System Settings and require the users enter their name and password.

2) Question: Can At Ease workstations recognize a CD-ROM tower connected to a server?

Answer: Workstations can see the CD-ROM discs as shared server volumes. It does not treat them as CD-ROM drives.

3) Question: When I use the At Ease Administration program to add a workstation to my approved list I got the following error, "Could not write the workstations list out to the server." Where is the workstation list and how can I fix this?

Answer: The workstation list is kept in the At Ease Server Prefs file on the At Ease server. This file is located in the Preferences folder which is in the System Folder. You should place the At Ease Server Prefs file in the trash, choose the Empty Trash command from the Special menu, and restart you server. Then reconfigure the server with the At Ease Administration application.

4) Question: Do you have to install At Ease to use the Network Assistant software?

Answer: No, You can perform a custom install of Network Assistant without installing At Ease.

5) Question: Do teacher handouts affect students disk quota?

Answer: Yes. When a teacher uses the Hand out feature in the Panels environment, the document is copied to each users Handout folder inside the their documents folder.

6) Question: With At Ease 4.0, I cannot select a printer for printer quotas unless a desktop printer file exists. How can I get a desktop printer file for my non-Apple printer?

Answer: The Read Me file states that At Ease does not create desktop printer files for non-Apple printers, you need to check with your printer vendor.

LocalTalk and LaserWriter Bridge 2.1: Read Me (11/96)

Revised: 11/26/96
Security: Everyone

LocalTalk and LaserWriter Bridge 2.1: Read Me (11/96)

=====

Article Created: 26 November 1996

TOPIC -----

This article is the LocalTalk & LaserWriter Bridge 2.1 Information ReadMe file.

DISCUSSION -----

You use the Apple LocalTalk Bridge to share LocalTalk-only devices, such as some LaserWriter printers, PowerBook notebook computers, or Newton MessagePad communications devices, on an Ethernet or Token Ring network. With the LocalTalk Bridge, you can access an Ethernet or Token Ring network while maintaining a seamless connection to your LocalTalk network. The LocalTalk Bridge is a commercial product, Apple part number M3246Z/A. A detailed product specification sheet is available on the Internet at:

<<http://product.info.apple.com/productinfo/datasheets/ss/localtalkbridge.html>>

You use the Apple LaserWriter Bridge much as the LocalTalk Bridge, except the LaserWriter Bridge is for printers only. You can share any printer that uses the LaserWriter icon in the Chooser using the LaserWriter Bridge. The LaserWriter Bridge is available for download at Apple Software Update sites on the Internet and many online services.

To use either of these utilities with Open Transport, you need to use version 2.1 or later of the utilities. This package includes a program to update LocalTalk Bridge 2.0 or 2.01 software to version 2.1. It also includes version 2.1 of the LaserWriter Bridge program.

System requirements for the LocalTalk or LaserWriter Bridge

=====

System software version 7.1 or later

Either classic AppleTalk networking software or Open Transport version 1.1 or

later.

Memory requirements:

- System software version 7.5.3, included in this package, requires a minimum of 4MB of RAM for computers with 68000-family microprocessors or 8MB of RAM for computers with PowerPC microprocessors.
- Open Transport requires a minimum of 5MB of RAM for computers with 68000-family microprocessors or 8MB of RAM for computers with PowerPC microprocessors. Open Transport memory requirements are based on total system memory including virtual memory, minus the size of any RAM disk and disk cache you choose.

Installing the software

=====

LocalTalk Bridge

If you have LocalTalk Bridge 2.0 or 2.0.1 software, use the updater program to update your software to version 2.1 (compatible with Open Transport).

There are two versions of the updater application. The file called "LTB 2.0 to 2.1 patch" updates LocalTalk Bridge version 2.0 to 2.1. The file called "LTB 2.0.1 to 2.1 patch" updates LocalTalk Bridge version 2.0.1 to 2.1.

1. To update your software, double-click the appropriate LocalTalk Bridge 2.1 updater application.
2. Choose Restart from the Special menu. When your computer starts up again, the updated LocalTalk Bridge is installed, and your LocalTalk Bridge control panel will be compatible with Open Transport.

LaserWriter Bridge

1. Replace your installed version of LaserWriter Bridge software with the version provided.
2. Choose Restart from the Special menu. When your computer starts up again, the updated LaserWriter Bridge is installed, and your LaserWriter Bridge control panel will be compatible with Open Transport.

LaserWriters: Meaning of VMerror & Limitcheck Errors (11/96)

Revised: 11/27/96
Security: Everyone

LaserWriters: Meaning of VMerror & Limitcheck Errors (11/96)

=====

Article Created: 27 November 1996

TOPIC -----

Sometimes when I print to my LaserWriter printer, I get an error that there was a VMerror or limitcheck error. What do these errors mean?

DISCUSSION -----

The PostScript language does not restrict or limit the sizes or quantities of things described in the language, such as numbers, arrays, stacks, paths, and so on. However, a PostScript interpreter running in a particular printer does have limits: the interpreter in the printer cannot process a printjob that exceed these limits. If the PostScript Interpreter attempts to perform some operation that would exceed one of these limits it may return the error "limitcheck," or "VMerror" if it exhausts virtual memory resources.

If you print a lot of complex documents to a PostScript printer, you may someday encounter a limitcheck or VMerror error.

limitcheck
=====

The occurrence of a limitcheck error usually indicates the print job itself contains an error or the job has some operation that exceeds one of the printers limits. There are different types of limitcheck errors; the specific limitcheck encountered error is typically listed when the error is reported. Appendix B of the PostScript Language Reference Manual provides an explanation and the typical values for such limits.

VMerror
=====

A VM error may occur if the memory becomes too low for the PostScript interpreter to reallocate memory to finish processing a job, or perhaps even provide a more accurate or specific error message, or to display any error message at all. It is impossible to predict accurately how much VM available to the PostScript interpreter a printjob will consume, and though by adding more memory to the printer may resolve a VMerror, there may be other workarounds to printing a complex document as well.

To workaround limitcheck and VM errors, try:

- Make sure your Macintosh is configured properly, such as you are using the latest or fashionably current version of the LaserWriter driver (which are v8.3.4 and 8.4.1 at the time this article was written).
- Make sure the proper PPD is selected. Instructions for selecting the proper PPD are listed in the Selecting a PPD File section later in this article. Old versions of the LaserWriter driver prior to LaserWriter 8.x did not use PPDs.
- If you are printing to an old printer with PostScript Level 1 ROMs, print instead to a printer containing PostScript Level 2 ROMs.
- Install more memory in the printer, particularly if it is a printer that contains an old implementation of PostScript (PostScript Level 1).
- Try creating a new document, then copy and past the contents of the old document into the new, then print.
- If you are using fonts that are non-resident to the printer, fonts not built-in to the ROM, select the Page Setup menu option, "Unlimited Downloadable Fonts in Document." One side effect is this option may be your print times may increase. Alternatively, use fewer non-resident fonts in your document, perhaps one or two typefaces, or merely use the built-in fonts. (A list of resident fonts can be displayed with the Apple Printer Utility, or found in the printer's specification sheet or manual.)
- Reduce the complexity of the document by removing unnecessary graphics.
- Cut down on the complexity of the graphics in a document. For example, some programs will "auto-trace" graphics, and sometimes the auto-trace results in excess bezier points. In this example, try hand-tracing the document with an illustration program, or edit out some of the unnecessary points.

Reduce the number of graduated fills (fills that go from one color to another in a rainbow-type fashion) in your document, or choose a solid screen or single percentage gray tone.

- Print the document a few pages at a time.
- If you notice that the document always stops printing when processing a certain page, try printing that page by itself, then print the pages that follow.

- Look for corruption in your document. For instance, if only a some pages do not print, look for in those pages a repeating element such as a font or graphic. Try placing that font or graphic on a page by itself and print just that page. If that page will not print, the font or graphic itself may be corrupted, requiring you to reinstall the font or obtain/create a new graphic.

Selecting a PPD File

=====

Step 1

Open the Chooser

Step 2

Select the LaserWriter 8 driver

Step 3

Locate and select the printer from the printer list

Step 4

Choose Setup. . ."

Be patient after selecting Setup for a dialog to appear: it may take a little while, particularly if someone else is printing to that printer.

One dialog may appear stating "setting up PostScript printer." When a PPD has been selected, another dialog stating "Current printer Description File (PPD) Selected: name of PPD" is displayed.

Step 5

Verify the proper PPD has been selected. If the proper PPD was not select, for example Generic is listed as being the selected PPD, click on the Select PPD button, then select the PPD for your printer. If no PPD appears in the listing of PPDs (which are stored in the Printer Descriptions folder), then reinstall the printer software so that the correct PostScript Printer Description file becomes available, then repeat these steps to configure your Macintosh printer driver to use the proper PPD.

CFM-68K Runtime Enabler Extension: Stability Issue (3/97)

Revised: 3/24/97
Security: Everyone

CFM-68K Runtime Enabler Extension: Stability Issue (3/97)

Article Created: 27 November 1996
Article Reviewed/Updated: 20 March 1997

TOPIC -----

This article describes a stability issue with the CFM-68K Runtime Enabler and 680x0 processor based Macintosh computers. There is also a series of related questions and answers.

DISCUSSION -----

Apple recommends customers disable the CFM-68K Runtime Enabler extension.

Apple Computer has discovered a bug in the CFM-68K Runtime Enabler extension that can affect the stability of Macintosh computers based on the 680x0 processor. This extension allows the use of certain applications on 680x0 computers, and is installed by an application installer only if the application requires the extension. Customers will know they have this extension installed if the file " CFM-68K Runtime Enabler" (note that the file name begins with a space) is located in their Extensions folder which resides inside their System folder.

In certain circumstances, the bug can cause applications which rely on the CFM-68K Runtime Enabler to not function properly, resulting in application instability and potential loss of data. The most obvious symptoms are what appear to be random system crashes and hangs. Macintosh and Mac OS-compatible computers based on the PowerPC processor are not affected by this bug.

Because of the potential quality impact of this bug, Apple is recommending that customers with computers based on the 680x0 processor disable the CFM-68K Runtime Enabler extension and not use programs which rely on this extension. See below for instructions on how to disable this extension. Apple is currently working to resolve this bug.

What is the CFM-68K Runtime Enabler?

The CFM-68K Runtime Enabler is an extension which makes it easier for developers of applications to design their programs to run on both 680x0 and PowerPC computers without having to write separate programs for both processor families.

On a more technical level, the Code Fragment Manager ("CFM") was originally introduced by Apple only for Macintosh and Mac OS-compatible computers based on the PowerPC processor. It allows applications to share their programming code through special files known as shared libraries. In addition to being able to share programming code, applications which are programmed to use shared libraries can reduce their memory requirements. In response to the success of the PowerPC version of CFM, Apple introduced a version of CFM for Macintosh computers based on the 680x0 processor. This version of CFM for 680x0-based Macintosh computers is the CFM-68K Runtime Enabler extension.

What applications are affected by this bug?

Only applications which have been explicitly programmed to use the CFM-68K Runtime Enabler can be affected by this bug. Apple Computer products which rely on CFM-68K Runtime Enabler are: OpenDoc, Cyberdog, LaserWriter (versions 8.4 and 8.4.1 only), and the Apple Media Tool. Only the 68K versions of these software packages are affected. This bug does not affect PowerPC versions of these products. There are currently few applications which rely on the CFM-68K Runtime Enabler and therefore Apple does not believe that this problem is very widespread.

You can identify applications which rely on the CFM-68K Runtime Enabler extension once the extension is disabled (see below for instructions on disabling the extension). When the CFM-68K Runtime Enabler is disabled, applications which rely on it will report the following error when you attempt to launch them:

"This application requires installation of the 'CFM-68K Runtime Enabler'."

Is this bug caused by these applications?

Not directly. The bug is caused by the use of CFM-68K Runtime Enabler in ways it was not designed to handle. Unfortunately, its limitations were not recognized by the applications.

What should I do if I have installed one of these affected products?

If you have installed OpenDoc or Cyberdog, you should not use these products until Apple releases a solution for this problem. If you have installed LaserWriter version 8.4 or 8.4.1, you should install LaserWriter version 8.3.4, which does not rely on the CFM-68K Runtime Enabler. If you do not have LaserWriter 8.3.4, you can download it from the Apple support site on the World Wide Web, which is located at:

<http://www.info.apple.com/>

If you are a member of the Apple Media Tool developer community, please visit the AMT web site at <http://amt.apple.com/> for more information.

If you have a PowerPC-based Macintosh or Mac OS-compatible computer, your computer is not affected by this problem. Therefore, you can continue to use these products.

Should I contact third-party application developers about this problem?

No. Since a fix for this problem will be accomplished by modifying Apple's CFM-68K Runtime Enabler, third-party application developers will be unable to assist you with this problem.

How do I disable this extension?

There are two ways to disable this extension. One is to drag the extension out of the Extensions folder which resides in your System Folder. The other is to use the Extensions Manager control panel.

To disable the CFM-68K Runtime Enabler extension using the Extensions Manager control panel, perform the following steps:

- 1) Open the Apple menu item and select Control Panels.
- 2) Locate Extensions Manager and double click it to open it.
- 3) Locate " CFM-68K Runtime Enabler". Note that there is a space at the beginning of the name. You should find this extension near the top of the Extensions Manager window under the Extensions heading.
- 4) If there is a check mark next to CFM-68K Runtime Enabler, click on it so that there is no check mark.
- 5) Close the Extensions Manager window.
- 6) Restart your computer.

Is this bug caused by recent changes in the CFM68k Runtime Enabler?

No. This bug exists in all currently shipping versions of CFM-68K Runtime Enabler, but was found during recent testing.

Why has it taken Apple this long to identify this bug?

Only recently have applications begun to make use of the CFM-68K Runtime Enabler extension. The conditions which cause this bug have only been exposed by recent increased use of the extension by applications.

I have a PowerPC computer. Does this affect me?

No. The bug is only in the CFM-68K Runtime Enabler extension, which runs only on Macintosh computers based on the 680x0 processor. The Mac OS on PowerPC computers does have code fragment capabilities, but it is accomplished through different programming techniques not affected by this bug.

What is Apple doing to fix this bug?

Apple has assigned a team of engineers to develop a solution for the bug. At this time, there is not enough information to make any statements about delivery of a solution.

How can I get the technical details about this bug?

Apple has a Technote about this bug available on the World Wide Web at:

<http://devworld.apple.com/dev/technotes/tn/tn1084.html>

Macintosh 5400, 6400, & 6360: -23 Error When Printing (3/97)

Revised: 3/21/97
Security: Everyone

Macintosh 5400, 6400, & 6360: -23 Error When Printing (3/97)

=====

Article Created: 27 November 1996
Article Reviewed/Updated: 21 march 1997

TOPIC -----

I have Power Macintosh 5400/120 computer that I am using in conjunction with a Hewlett Packard Deskwriter 660c printer. When I attempt to print, either an error -23 occurs or the computer hangs. How can I prevent this from happening?

DISCUSSION -----

The cause appears to be the HP printer driver. Apple Computer and Hewlett Packard have verified that a -23 error may occur when printing from a Power Macintosh or Performa 5400, 6400, or 6360 computer to any HP Deskwriter 600 series printer using certain older versions of the HP Serial printer driver.

Revised printer drivers have been posted by Hewlett-Packard to their World Wide Web site.

For DeskWriter 600 series printers, use version 9.2.1 of the driver.
For DeskWriter 800 series printers, use version 9.3 of the driver.

If you need to print but do not have the revised driver, a workaround would be to either turn off virtual memory or use the AppleTalk (rather than Serial) printer drivers.

Newton Connection Kit for Windows: Can't Use OS/2 (11/96)

Revised: 12/2/96
Security: Everyone

Newton Connection Kit for Windows: Can't Use OS/2 (11/96)

=====

Article Created: 2 December 1996

TOPIC -----

I have an Apple MessagePad 120 with the Newton 2.0 OS. I am trying to get data off the Messagepad 120 into my OS/2 computer. When I try to use the Windows shell within OS/2 with the Newton Connection Kit, an error message appears on the MessagePad stating that the PC is not responding. How can I get this to work?

DISCUSSION -----

The Newton Connection Kit for Windows is not supported using the Windows shell with OS/2. Apple Computer, Inc. does not have a solution for getting data from Apple MessagePad devices to OS/2 computers. Apple does not currently have plans to support OS/2 operating system.

Writing & Publishing Tools: Author's Toolkit Dictionaries 12/96

Revised: 12/2/96
Security: Everyone

Writing & Publishing Tools: Author's Toolkit Dictionaries 12/96

=====

Article Created: 2 December 1996

TOPIC -----

The Author's Toolkit, included on the Apple Education Series, Writing and Publishing Tools Backup CD (691-1214-A v1.1) does not install the dictionaries used by the application. The dictionaries cannot be custom installed or drag copied to the hard disk. When I choose Dictionaries from the Edit menu, I get an error message that states "Can't find the spelling dictionaries. Make sure that the folder "SCET Dictionaries" is in the Preferences Folder."

Why does this happen and where can I get these dictionaries?

DISCUSSION -----

The Apple Education Series - Writing and Publishing Tools CD installs a number of packages included with the Writing and Publishing Tools software bundle. The dictionaries were inadvertently left off the CD-ROM disc. The Author's Toolkit is specifically looking for a folder called "SCET Dictionaries" that includes the following dictionaries:

SCET Main Dictionary
SCET User Dictionary

This folder should be placed in the Preference folder located in System Folder. You can obtain a copy of the dictionaries from Sunburst Communications, the developer of The Author's Toolkit. Sunburst can be reached at following addresses and phone numbers:

Sunburst Communications
101 Castleton Street
Pleasantville, NY 10570 U.S.A.

7500/7600/8500: Use Built-In Video For Video Digitizing (12/96)

Revised: 12/2/96
Security: Everyone

7500/7600/8500: Use Built-In Video For Video Digitizing (12/96)

=====

Article Created: 2 December 1996

TOPIC -----

This article discusses potential issues with digital video recording when adding and using a third-party PCI video card to a Power Macintosh 7500, 7600, or 8500 series computer.

DISCUSSION -----

The Power Macintosh 7500, 7600, and 8500 series computers come with built-in video support and support for digital video recording. Because the video digitizer is tied to the built-in video on these computers, digital video recording will work best when the built-in video is used.

If a PCI video card is added, and the built-in video is not used at all (that is, there is nothing connected to the built-in video connector), video digitizing applications such as Apple Video Player will record sluggishly.

If a PCI video card and built-in video are being used simultaneously (that is, there are two monitors connected to the computer), Apple Video Player will work best when the video window is on the monitor connected to the built-in video connector.

This article was published in the Information Alley on 2 December 1996.

6360/54xx/64xx:Digitizer Not Available w/ Only PCI Video (12/96)

Revised: 12/2/96
Security: Everyone

6360/54xx/64xx:Digitizer Not Available w/ Only PCI Video (12/96)

=====

Article Created: 2 December 1996

TOPIC -----

This article discusses issues of which you should be aware when adding and using a third-party PCI video card to a Power Macintosh or Macintosh Performa 6360, 5400, or 6400 series computer.

DISCUSSION -----

The Power Macintosh or Macintosh Performa 6360, 5400 series, and 6400 series Power Macintosh come with built-in video support. These computers also have support for video editing, the TV Tuner Card, and the FM/TV Tuner Card. Because the video digitizer is tied to the built-in video on these computers, there are two situations of which you should be aware:

1) If a PCI video card is added, and the built-in video is not used at all (that is, there is nothing connected to the built-in video connector):

The video digitizer will not initialize on startup and will not be available to applications such as Apple Video Player and Apple FM Radio. Apple Video Player, Apple FM Radio, Avid Cinema, and any other application requiring the video digitizer will not function when the built-in video connector is not being used.

2) If a PCI video card and built-in video are being used simultaneously (there are two monitors connected to the computer):

Apple Video Player will launch, but will perform much better when the video window is on the monitor connected to the built-in video connector. Apple FM Radio will work with no problems (assuming the FM/TV Tuner Card is installed). Avid Cinema will work with no problems (assuming the Avid Cinema hardware and software are installed) as long as the monitor connected to the built-in video connector is the monitor with the menu bar. The menu bar must be on this monitor when the computer is started up. To change the location of the menu bar, open the Monitors & Sound control panel and click the Arrange button.

AppleShare Workstation: Maximum Viewable Volumes (12/96)

Revised: 12/2/96
Security: Everyone

AppleShare Workstation: Maximum Viewable Volumes (12/96)

=====

Article Created: 2 December 1996

TOPIC -----

What is the maximum number of viewable volumes in the AppleShare client login window?

The reason I ask is our Windows NT server has 200 volumes, and when connecting to the server with AppleShare Workstation client software we can only see 150. We are at the point where AppleShare and the server have been chosen in the Chooser; guest or registered user and password has been entered; then in the volume selection window, only 150 volumes are available to be selected.

DISCUSSION -----

AppleShare Workstation (client software) 3.6.1 or later should support up to 256 volumes. You should upgrade to the latest version of AppleShare Workstation software which can be found on Apple Computer's online software update locations.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

PCI Power Mac: Drive Setup Is Unable To Update Driver (12/96)

Revised: 12/3/96
Security: Everyone

PCI Power Mac: Drive Setup Is Unable To Update Driver (12/96)

=====

Article Created: 2 December 1996

TOPIC -----

This article discusses situations where Drive Setup 1.0.4 may not be able to update the SCSI driver on a PCI-based Power Macintosh computers, like a 7600/132 or 8500/180.

DISCUSSION -----

Some users have reported issues when attempting to updated their SCSI disk driver with Drive Setup 1.0.4. They notice the Update Driver option is dimmed, and if they reformat the hard disk, they can update the driver.

The update driver option may be dimmed because of the following:

The hard disk was formatted with a third-party utility

Drive Setup will not attempt to update the drivers on a device being controlled by a third party driver. A reason for this, is to not replace a security driver which may have moved vital data on the hard disk. The next time the user starts the computer, the hard disk may now be corrupted and unusable.

The installed driver is newer than the version supplied in Drive Setup

Check the version of the hard disk driver by selecting the hard disk and choosing the Get Info command in the File menu. The Info window will show the version information for the driver in the Where field. For instance, a drive formatted with Apple's Drive Setup might show:

Macintosh HD, Bus 0, SCSI ID 0, (v8.0.4)

The driver version is listed between the parentheses. If the version is newer than the version of the driver installed by Drive Setup, Drive Setup will not be able to update the driver. You do not want to place an older version of the driver on the hard disk so the update option is disable in this circumstance.

You can refer to the last two digits of the driver version number to determine whether the version of Drive Setup will have a newer driver. For example, if in the Get Info window, the driver version number is 8.0.5 and the version of Drive Setup is 1.0.4, Drive Setup will not update the driver (.0.5 is newer than .0.4).

Some PCI Power Macintosh computers shipped with Drive Setup 1.0.4 and with hard disks that contain SCSI driver version 8.0.5. Driver version 8.0.5 has fixes specific to the Power Macintosh 9500/200. The 9500/200 ships with a Drive Setup Updater program that will let users update their SCSI driver to version 8.0.5 after formatting with Drive Setup 1.0.4. However, other PCI Power Macintosh computers, like the Power Macintosh 7600 and 8500, may also ship with hard disks that have driver version 8.0.5. Drive Setup 1.0.4 will not update these drivers resulting in the update option being dimmed.

Do not be concerned with Drive Setup 1.0.4 not being able to update the driver on computers other than the Power Macintosh 9500/200. Due to manufacturing efficiency, the 8.0.5 version of the SCSI driver is being installed on all SCSI hard disks. If you are not using a Power Macintosh 9500/200, there is no harm in formatting the hard disk with Drive Setup 1.0.4 and having the driver revert to version 8.0.4. Also, there is no need to format a hard disk and revert to driver version 8.0.4 just because the update option in Drive Setup is dimmed.

PCI Power Mac: Drive Setup Is Unable To Update Driver (12/96)

Article Created: 2 December 1996
Article Reviewed/Updated: 20 December 1996

TOPIC -----

This article discusses situations where Drive Setup 1.0.4 may not be able to update the SCSI driver on a PCI-based Power Macintosh computers, like a 7600/132 or 8500/180.

DISCUSSION -----

Some users have reported issues when attempting to updated their SCSI disk driver with Drive Setup 1.0.4. They notice the Update Driver option is dimmed, and if they reformat the hard disk, they can update the driver.

The update driver option may be dimmed because of the following:

The hard disk was formatted with a third-party utility

Drive Setup will not attempt to update the drivers on a device being controlled by a third party driver. A reason for this, is to not replace a security driver which may have moved vital data on the hard disk. The next time the user starts the computer, the hard disk may now be corrupted and unusable.

The installed driver is newer than the version supplied in Drive Setup

Check the version of the hard disk driver by selecting the hard disk and choosing the Get Info command in the File menu. The Info window will show the version information for the driver in the Where field. For instance, a drive formatted with Apple's Drive Setup might show:

Macintosh HD, Bus 0, SCSI ID 0, (v8.0.4)

The driver version is listed between the parentheses. If the version is newer than the version of the driver installed by Drive Setup, Drive Setup will not be able to update the driver. You do not want to place an older version of the

driver on the hard disk so the update option is disable in this circumstance.

You can refer to the last two digits of the driver version number to determine whether the version of Drive Setup will have a newer driver. For example, if in the Get Info window, the driver version number is 8.0.5 and the version of Drive Setup is 1.0.4, Drive Setup will not update the driver (.0.5 is newer than .0.4).

Some PCI Power Macintosh computers shipped with Drive Setup 1.0.4 and with hard disks that contain SCSI driver version 8.0.5. Driver version 8.0.5 has fixes specific to the Power Macintosh 9500/200 and Workgroup Server 8550/200. The 9500/200 and WS 8550/200 ships with a Drive Setup Updater program that will let users update their SCSI driver to version 8.0.5 after formatting with Drive Setup 1.0.4. If either the 9500/200, or 8550/200 is reformatted using Drive Setup, the driver installed will be listed, when performing a Get Info, as version 8.0.4. The Drive Setup Updater when used to update the driver to version 8.0.5 will still be listed, in Get Info, as 8.0.4 -- the driver itself gets updated, but the version string does not. Other PCI Power Macintosh computers, like the Power Macintosh 7600 and 8500, may also ship with hard disks that have driver version 8.0.5. Drive Setup 1.0.4 will not update these drivers resulting in the update option being dimmed.

Do not be concerned with Drive Setup 1.0.4 not being able to update the driver on computers other than the Power Macintosh 9500/200. Due to manufacturing efficiency, the 8.0.5 version of the SCSI driver is being installed on all SCSI hard disks. If you are not using a Power Macintosh 9500/200, there is no harm in formatting the hard disk with Drive Setup 1.0.4 and having the driver revert to version 8.0.4. Also, there is no need to format a hard disk and revert to driver version 8.0.4 just because the update option in Drive Setup is dimmed.

This article was published in the Information Alley on 4 December 1996.

GeoPort/Express Modem Update 3.0 & Apple Telecom 3.0 (12/96)

Revised: 12/3/96
Security: Everyone

GeoPort/Express Modem Update 3.0 & Apple Telecom 3.0 (12/96)

=====

Article Created: 2 December 1996

TOPIC -----

Is the Apple Telecom 3.0 software included in the GeoPort and Express Modem Update 3.0 software found on Apple Computer's software update locations?

DISCUSSION -----

The GeoPort and Express Modem Update 3.0 upgrades the lower level components of Apple Telecom software to 3.0.3. It does not provide the Apple Telecom 3.0 applications, in other words the Apple Telecom 2.x applications are not upgraded.

As of November, 1996 the only users that should have Apple Telecom 3.0 applications are Macintosh or Performa computers that contain a bundled GeoPort internal modem.

Apple Printer Utility: How To Install a 'Fat' Version (12/96)

Revised: 12/3/96
Security: Everyone

Apple Printer Utility: How To Install a 'Fat' Version (12/96)

=====

Article Created: 3 December 1996

TOPIC -----

How do I install a 'fat' version of the Apple Printer Utility?

Note:

A 'fat' version of an application means the application contains both PowerPC native code and 68000 code.

DISCUSSION -----

If you to install a 'fat' version of the Apple Printer Utility from the LaserWriter 8.4 or LaserWriter 8.4.1 installation disks, you must install the software in the following order.

Step 1

Launch the LaserWriter software Installer.

Step 2

Select Custom Install

Step 3

Select the first option; Printer software fro all Macintosh computers.

If you perform an easy install or Custom Install of the Apple Printer Utility, only a version that runs on the computer architecture of the target computer is installed. So, if you have a Macintosh Quadra 700, only a 68k version of the software would be installed. If you had a Power Macintosh 6100 computer, only a PowerPC version of the software would be installed.

AICK 1.2: Product Description and Details (12/96)

=====

Article Created: 4 December 1996

TOPIC -----

This article describes the Apple Internet Connection Kit (AICK) 1.2 and gives product details.

DISCUSSION -----

The Apple Internet Connection Kit is an integrated collection of Apple and third-party software that lets a Macintosh computer user connect directly to the Internet quickly and easily. It's the perfect solution for users who want direct Internet access -- today.

The popularity of the Internet continues to grow exponentially, as more and more people discover the amazing information and communication resources available online. But navigating (or "surfing") the Internet requires more than just a desire to try it. You need a variety of software tools -- browsers, viewers, file-transfer programs, e-mail, and more -- as well as a qualified Internet service provider. In fact, setting up your computer for Internet connection can be a time-consuming process.

Luckily, Macintosh users who want to connect to the Internet already have one big advantage: right out of the box, the Macintosh is the easiest-to-use computer available. Now Apple has made direct Internet connection easier than ever for Macintosh owners.

With the Apple Internet Connection Kit, you get high-quality, "best of class" software in all of the categories you need for successful Internet access and use. You also get the Apple Internet Dialer, which makes signing up with a qualified Internet service provider and getting connected to the Internet a matter of minutes rather than days. Just double-click the application and fill in the blanks, and the Apple Internet Dialer will call a service provider for you. Within minutes, you'll be connected to the Internet -- where you can send and receive e-mail, conduct research, plan your own travel itinerary, play games, shop, and much, much more.

Because dealing with the Internet sometimes raises more questions than it answers, the Apple Internet Connection Kit includes a Getting Started Guide and special Apple Guide online help, as well as third-party documentation.

The Apple Internet Connection Kit -- the easiest, fastest, most complete tool for connecting your Macintosh computer directly to the Internet.

Features

Quick, direct Internet access

- Features software that makes creating an account with an Internet service provider a quick, online process
- Includes all of the software tools needed for direct Internet access
- Lets you access and use all the Internet hot spots: the World Wide Web (WWW), e-mail, newsgroups, and FTP servers
- Enables local area networks that are connected to the Internet to standardize on one set of Internet tools

Ease of use

- Provides an all-in-one solution for Internet connection
- Installs easily; one-button installation and configuration for all key applications
- Helps you automatically create a new account with an Internet service provider, or you can use an existing account
- Is compatible with other Internet tools

Applications included

- Apple Internet Dialer, online Internet service registration and connection software
- Netscape Navigator
- Apple Guide for the Apple Internet Connection Kit
- Claris EMailer Lite
- Dartmouth Fetch
- NewsWatcher
- NCSA Telnet
- QuickTime plug-in
- QuickTime VR Player
- Macromedia Shockwave plug-ins
- RealAudio Player
- Adobe Acrobat Reader
- Aladdin Stuffit Expander
- OnBase Technology DragNet
- Farallon Look@Me
- Dartmouth MacPing
- PPP and SLIP software

Technical support

- Includes a Getting Started Guide and electronic third-party documentation
- Features online help via Apple Guide assistance
- Provides access to Apple Internet Connection Kit website
- Provides telephone support for installation and configuration

Product Details

Apple Internet Dialer online Internet service registration software

- Helps you automatically create an account with an Internet service provider
- Offers a choice of qualified Internet service providers in your area
- Configures the applications to run on your system

Netscape Navigator browser software

- Allows you to browse the World Wide Web

Claris EMailer Lite software

- Enables you to send and receive Internet e-mail

Dartmouth Fetch FTP software

- Lets you access File Transfer Protocol (FTP) services to download specific files

NewsWatcher browser software

- Allows access to Usenet newsgroup discussions

NCSA Telnet terminal emulation software

- Allows your Macintosh to emulate a terminal for connection to many libraries and catalogs

QuickTime plug-in, QuickTime VR Player

- Lets you view video and interactive multimedia presentations over the Internet

Macromedia Shockwave plug-ins

- Lets you interact with "shocked" websites containing Macromedia Authorware, FreeHand, and Director multimedia content

RealAudio Player

- Enables you to hear live audio broadcasts over the Internet

Adobe Acrobat Reader

- Lets you view Portable Document Format (PDF) files in their exact original format

Aladdin Stuffit Expander decompression software

- Automatically decompresses files that you download from the Internet

OnBase Technology DragNet

- Helps you organize your frequently visited websites, newsgroups, and FTP sites, as well as keep track of your favorite e-mail addresses

Farallon Look@Me

- Lets you view another Look@Me user's screen anywhere in the world for real-time collaboration over the Internet

Dartmouth MacPing

- Provides a useful network troubleshooting tool

PPP and SLIP software

- Allows the use of the MacTCP application program over your modem line, so your Macintosh and Internet applications can communicate with the protocols used by the Internet (PPP and SLIP)

Support

- Includes a Getting Started Guide to help you get acquainted with the Internet and set up your account with an Internet service provider
- Provides telephone support for installation and configuration

Online help and documentation

- Includes Internet-specific Apple Guide online help
- Offers third-party documentation on CD
- Provides access to Apple Internet Connection Kit website

System requirements

- Apple Macintosh, Power Macintosh, PowerBook, or other Mac OS-based computer (68030 or later)
- Minimum 12MB of RAM with virtual memory, 16MB recommended
- Macintosh system software version 7.5 or later
- A 9,600 bps (or faster) modem (28,800 bps recommended) or a connection to a local area network that is already connected to the Internet
- A minimum of 25MB of available hard disk space
- A high-density floppy disk drive or CD-ROM drive

Ordering Information

Apple Internet Connection Kit

Order No. 504181U

- CD-ROM with disc exchange containing all of the Internet software and support (including electronic documents) described in "Product Details"

For information regarding ClarisPLUS volume licensing, contact Claris Corporation at one of the following:

QuickDraw 3D v1.5: Read Me (12/96)

Revised: 12/4/96
Security: Everyone

QuickDraw 3D v1.5: Read Me (12/96)

Article Created: 4 December 1996

TOPIC -----

This article is the QuickDraw 3D version 1.5 ReadMe file.

DISCUSSION -----

Important Information About QuickDraw 3D

QuickDraw 3D enables your computer to display three-dimensional graphics using applications designed to take advantage of QuickDraw 3D. It also provides a common file format, called QuickDraw 3D Metafile (or 3DMF for short), for exchanging 3D documents. QuickDraw 3D also provides acceleration services which support plug-and-play accelerator cards.

For computers running the Mac OS, the following are required to install and run QuickDraw 3D:

- A PowerPC based computer with a minimum of 16 megabytes of memory (RAM)
- Mac OS System 7.1.2 or later

The latest version of QuickDraw 3D, along with software demos, QuickDraw 3D Metafiles, and additional information is available through the Internet at the following site:

<http://quickdraw3d.apple.com/>

Using QuickDraw 3D

The QuickDraw 3D folder includes the following applications, 3D models, and textures that allow you to explore the 3D capabilities of your computer:

- SimpleText version 1.3.1 and Scrapbook version 7.5.2. These applications allow you to open and interact with 3DMF models.
- A new Scrapbook File with sample 3DMF models.

- A number of 3DMF models provided by:
Model Masters at URL: www.interaccess.com/modelmaster
Plastic Thought, Inc. at URL: www.3d-active.com
Viewpoint DataLabs International at URL: www.viewpoint.com
Zygote at URL: www.zygote.com

You can expect even more applications that use QuickDraw 3D in the near future, including new versions of application programs you may already own. Contact your software vendors for more information about their plans to support this new technology.

Troubleshooting

If you try to start an application that uses QuickDraw 3D and get the message "The application '<application name>' could not be launched because QuickDraw 3D could not be found," make sure that the following files are in the Extensions folder, inside the System Folder:

- QuickDraw 3D
- QuickDraw 3D IR
- QuickDraw 3D RAVE
- QuickDraw 3D Viewer

If the files are there and you still get the message, it means that you don't have enough memory to run the application. You may be able to open the application if you try the following:

- Quit other open applications.
- Reduce the amount of memory allocated to the application. This is done by:
 - selecting the application's icon in the Finder
 - choosing Get Info from the File menu
 - typing a lower number in the boxes for Minimum Size and Preferred Size
- Install more memory (RAM).

If you are using a localized system, and you install this U.S. software, you will need to copy the Scrapbook File in the QuickDraw 3D Folder to the System Folder on your computer. Otherwise, when you choose Scrapbook from the Apple menu, you will get an empty scrapbook. Note that this operation will replace any existing Scrapbook File in the System Folder, thus erasing any previously stored contents.

Some of the sample models included with QuickDraw 3D, such as Big Ben and Red Hatchback, are highly detailed (they contain additional 3D modeling data such as vertex normals and surface UVs) and thus will require a larger amount of memory than the other supplied models. If you experience problems when opening these files from SimpleText, you should open only one file at a time.

How QuickDraw 3D uses memory

QuickDraw 3D is a shared library. When no applications that rely on QuickDraw 3D are open, the library does not take up memory space (RAM). Once a QuickDraw 3D-based application is open, the amount of memory taken up by the shared

library doesn't increase if other QuickDraw 3D-based applications are launched. Of course, each application will take up memory according to their size and the complexity of the files being used. The memory taken up by QuickDraw 3D becomes available when you quit all QuickDraw 3D-based applications.

While a QuickDraw 3D application is open, the QuickDraw 3D library allocates memory from temporary memory. This memory shows up in the About This Macintosh window as memory used by the System. When you quit the application, the memory becomes available, but the size shown in the About This Macintosh window may not reflect this. The memory previously used by QuickDraw 3D is, nonetheless, available for other applications (it is released to the applications as needed).

Apple QuickDraw 3D Accelerator Card

If you have an Apple QuickDraw 3D Accelerator Card present in your machine, the following files will also be installed in the Extensions folder, inside the System Folder:

- Apple QD3D HW Driver
- Apple QD3D HW Plug-In

If you need to re-install these files at a later time, you can do so by launching the Installer, as described in the section below under "If you need to reinstall QuickDraw 3D," selecting Custom Install from the pop-up menu, and then selecting the Apple QuickDraw 3D Accelerator Card item in the list.

We recommend that you turn off Virtual Memory when using Apple's QuickDraw 3D Accelerator Card.

Scrapbook 7.5.2

We strongly recommend that the Scrapbook not be used with less than 300k of memory available. To determine how much memory is available, choose About This Macintosh from the Apple menu and look at the value next to Largest Unused Block.

If you need to reinstall QuickDraw 3D

If you need to reinstall QuickDraw 3D, follow these steps:

- 1) Open the QuickDraw 3D Install folder and double-click the Installer icon.
- 2) After installing QuickDraw 3D, restart your computer.
- 3) If you want the items in the QuickDraw 3D Extras folder, drag the folder to the newly-created QuickDraw 3D Folder inside the Apple Extras folder.

Removing QuickDraw 3D

If you wish to remove QuickDraw 3D, follow these steps:

- 1) Open the QuickDraw 3D Install folder and double-click the Installer

icon.

- 2) Choose Custom Remove from the pop-up menu.
- 3) Click the box next to each item to put a check in it.
- 4) Click Remove.
- 5) Restart your computer.

Apple Network Server: Shutting Down uShare (3/97)

Revised: 3/12/97
Security: Everyone

Apple Network Server: Shutting Down uShare (3/97)

=====

Article Created: 4 December 1996
Article Reviewed/Updated: 12 March 1997

TOPIC -----

I am attempting to unmount volumes on an Apple Network Server but get an error saying the volumes are in use. I suspect this is because uShare still has active processes. I shutdown uShare using the following command:

```
/ushare/bin/ustop
```

DISCUSSION -----

Though the command above generally works well for shutting down uShare, it may leave a number of processes active. The following command will force uShare to kill all open processes with a timeout value set to zero:

```
/ushare/bin/usstop to=0 all
```

AMT and Audio Issue on Windows PCs (12/96)

Revised: 12/5/96
Security: Everyone

AMT and Audio Issue on Windows PCs (12/96)

=====

Article Created: 5 December 1996

TOPIC -----

There is a issue with audio when running an AMT project on PCs under Windows (Windows 95, Windows NT Workstation 3.51, and Windows 3.1). Here is the brief description:

In a project with audio narration for each screen, sound is in the form of an audio-only QuickTime movie, a keyboard object is used in each screen to let the user set the audio volume level.

Everything works fine on the Macintosh computer. On the PC, the number (volume) keys work, but if you set the volume low or off, when you advance to the next screen, the audio level gets reset to a louder setting -- possibly the default volume setting for the sound card.

DISCUSSION -----

This behavior, and the possibility of a change, is under investigation. This behavior does not occur when using .WAV audio files. If the setting the sound level for Windows users is an important feature for your project, try using .WAV files for your sounds.

About At Ease 4.0.1 Updater: Read Me (2/97)

Revised: 2/12/97
Security: Everyone

About At Ease 4.0.1 Updater: Read Me (2/97)

=====

Article Created: 6 December 1996
Article Reviewed/Updated: 12 February 1997

TOPIC -----

This article is the About At Ease 4.0.1 Updater ReadMe file.

DISCUSSION -----

Important Information about At Ease 4.0.1 Updater

The At Ease 4.0.1 Updater updates At Ease for Workgroups 4.0 to the latest version. This updater works only with At Ease version 4.0.

Requirements for Updating
=====

Version 4.0 Already Installed

You can use the Updater only on a workstation that has version 4.0 installed. The Updater will not run if you have an older version (3.x or earlier) of At Ease installed. If you have an earlier version of At Ease, you must obtain At Ease 4.0 (which is part of the Apple Network Administrator Toolkit) before you can use this updater.

At Ease Server Not Changed

Only the At Ease client and administrator workstations need to be updated. The At Ease Server used in version 4.0 has not changed for 4.0.1 and will not be updated by this updater application program. You should continue to use the At Ease 4.0 version of the At Ease Server extension.

Updating Procedure
=====

Installation Options

There are three ways of updating At Ease 4.0 on one or more machines: by using Network Assistant 2.0 or later, by using an At Ease 4.0.1 Updater's floppy disk on each workstation, or by installing the updated software on each workstation by launching the Updater over the network on a server. Note that if you choose to perform the update by using Network Assistant, you must first update one workstation via floppy disk or over the network. It is probably most convenient to first update the administrator workstation from which you will perform the At Ease 4.0.1 update. On this workstation you must install both the administrator and client workstation software. The administrator workstation and every client workstation which you wish to update must already have Network Assistant installed on it.

Files the Updater Needs to Locate

The Updater attempts to locate and, in most cases, update all of the files automatically.

If it cannot automatically find a file, it will ask you for the location of the missing file. If you cannot locate the file, or if you know the file does not exist on the machine, you can click the Skip button to bypass that particular file. You may need to do this if you want to update just the administration program on your machine because it does not also have the workstation software installed on it.

If the Updater finds multiple copies of a file, it will ask if you want to remove the other copies before it updates. Other copies must be removed before the update can take place. You can have the Updater remove the other copies automatically, or you can cancel the update and remove them manually using the Finder. If you cancel the update, no files will be touched.

Updating Using Network Assistant

Using the Network Assistant application program to perform the update, it is not necessary to visit each individual workstation; the updating can be done from an administrator's workstation, as long as the administrator's workstation has already been updated to At Ease 4.0.1, and as long as the four boxes "Allow administrators to:", "Restart and shut down this workstation", "Copy items to this workstation", and "Delete and Replace items on this workstation" are checked.

Follow these steps to update At Ease 4.0 to version 4.0.1 by using Network Assistant 2.0 or later:

- 1) Launch the At Ease Administration application program from an administrator workstation. Make sure the At Ease server that you want to administer is listed in the upper left-hand corner of the initial window. If it is not, click the Change Server button and find the correct At Ease server. Enter the administrator's password and click the OK button.

- 2) The next window that appears is the main At Ease Administration window. Turn

off At Ease on each client workstation you are updating by clicking the "Off" button in the upper right-hand corner. Now quit At Ease Administration.

3) Launch Network Assistant, enter your password, and click OK. In the Workstation Status window will appear each client workstation which can be administered by the workstation running Network Assistant. Hold down the shift key and click on each workstation which you want to update to At Ease 4.0.1.

4) From the Manage menu select the Restart... menu item. In the resulting dialog click on the "Let users save their work" button and then click the restart button. The selected machines will restart and launch the Finder.

5) In the Workstation Status window, reselect the workstations you selected in step 3 above, and from the Manage menu, select the Copy Items... menu item.

6) In the resulting dialog, click on the word "contains" and from the pop-up menu select the word "is". In the white box to the right enter the words "At Ease" and click the Find button below. In the "Items found on" list, select the line whose "Kind:" is "system extension" and whose "Location:" ends with ":System Folder:" in the panel below (there may be only one item in the list). Click on the Copy button below the list.

7) A dialog will appear warning you that the item already exists. Click on the Replace button.

8) In the box to the right of the "name" and "is" buttons, change "At Ease" to "At Ease Startup" and click the Find button. In the "Items found on" list, select the line whose "Kind:" is "system extension" and whose "Location:" ends with ":System Folder:Extensions:" in the panel below (there may be only one item in the list). Click on the Copy button below the list.

9) A dialog will appear warning you that the item already exists. Click on the Replace button.

10) Click on the Close Window button which is below the Find button. Quit the Network Assistant application program.

11) Launch the At Ease Administration application program as you did in step 1 above. Make sure the At Ease server that you want to administer is listed in the upper left-hand corner of the initial window. If it is not, click the Change Server button and find the correct At Ease server. Enter the administrator's password and click the OK button.

12) The next window that appears is the main At Ease Administration window. Turn on At Ease on each client workstation you updated by clicking the "On" button in the upper right-hand corner. Quit the At Ease Administration application program.

13) Repeat steps 3 and 4 above to restart each client workstation in order to activate At Ease again.

Updating From a Floppy Disk

If you want to update to At Ease 4.0.1 by using a floppy disk, and you do not have one, you can make an update floppy disk from the on-line image by using the Disc Copy application program.

Turn off At Ease on each client workstation you are updating by launching the At Ease Administration application program on an administrator workstation. Turn At Ease "Off" in the main window.

Follow these steps on each client workstation to update At Ease from the floppy disk:

- 1) Restart the client workstation; it will now start up in the Finder instead of in At Ease.
- 2) Insert the Updater disk.
- 3) Double-click to open the At Ease 4.0.1 Updater application program.
- 4) Click Begin in the opening screen.
- 5) If the Updater cannot find a file it needs to update, a message appears asking you to locate that file. If you cannot find the At Ease or At Ease Startup files, click Skip to cancel the update.
- 6) If necessary, locate any missing files and start the update again.

When each client workstation has been updated, turn At Ease back on at each client workstation by launching the At Ease Administration application program on an administrator workstation; turn At Ease "On" in the main window. Restart each client workstation, which will now start up in At Ease.

Updating Over the Network

Perform these steps on an administrator workstation:

- 1) Copy the Updater application to an AppleShare server volume to which your At Ease workstations have access.
- 2) Make sure the application is locked. (To do this, select the Updater's icon, choose Get Info from the File menu, then click to put an X in the checkbox labeled "Locked.")
- 3) Turn off At Ease on each workstation you are updating by running the At Ease Administration application and turning At Ease "Off" in the main window.

Perform these steps on each client workstation to be updated:

- 1) Restart the client workstation; it will now start up in the Finder instead of in At Ease.
- 2) Mount the server volume that contains the Updater application and locate it.
- 3) Double-click to open the Updater application.

4) Click Begin in the opening screen.

When each client workstation has been updated, turn At Ease back on at each client workstation by running the At Ease Administration application program from an administrator workstation. Turn At Ease "On" in the main window. Restart each client workstation, which will now start up in At Ease.

Clarification: User's Own AppleShare Privileges

=====

A change has been made to version 4.0.1 to allow certain AppleShare volumes mounted by At Ease users to use their AppleShare access privileges instead of having At Ease mandate additional restrictions. This change mostly benefits restricted Finder users, but panels users may also benefit from this. Because this change may unknowingly and adversely affect security at some sites, this feature is initially OFF in At Ease 4.0.1, and must be activated by the administrator for every workgroup that he or she wishes to allow this.

What this feature does is to allow any mounted AppleShare volume, other than the current workgroup data server volume, to use the access rights that are given to the AppleShare user. If turned on, At Ease will no longer attach read-only privileges to folders that the user are able to open. Additionally, copy restrictions are removed, allowing the user to copy files to and from the AppleShare volume if permitted by AppleShare. At Ease does not (and cannot) give more access than was set by the AppleShare Administration program for that logged-in AppleShare user on that server. Users are still restricted to applications that are allowed to be launched on these volumes.

When a user attempts to open or save a document using the standard open or save file dialog and the feature has been turned on, the "Places" location will also show any AppleShare volumes that are mounted. This permits the user to open or save to the AppleShare volume; a feature that did not exist previously.

To activate this feature, the administrator should create or edit a workgroup and select the Locations pane for that workgroup. At the bottom of the pane, select the "Use existing AppleShare privileges..." checkbox to turn this feature on. Administrators may want to make sure that any AppleShare volumes that they have set to auto mount (using the Access To Volumes menu command), use the user's own names and passwords if security is an issue for that volume.

As mentioned earlier, the workgroup data server volume's rights do not change when using this feature. This is because of security concerns with the Documents folder used on the server volume.

Other Changes and Enhancements

=====

The following additional changes have been made in At Ease 4.0.1 and are described in detail below.

Major Changes

1) Deletions of large numbers of users in the main window of the administration program has been speeded up. Administrators should note that if you decide not to delete the user's documents folders (and its contents), then this will also speed up deletion, regardless of whether or not the user had any existing documents (that is, if you want to make it go the fastest, you should select NO when asked to delete the user's documents).

2) A problem where CD-ROM settings shown in the CD-ROM Preferences menu command in the administration program, showing information for a different CD-ROM has been fixed. This problem most often showed itself on 7.5.3 or later machines, and usually running on PPC systems. If you are having this problem, you MUST delete your CD-ROM Preferences file on the server before attempting to add or alter any CD-ROM discs since the fix cannot repair an already corrupted file.

3) A crash problem was fixed on At Ease workstations when entering the Finder (either restricted or non-restrictive). This problem would only occur on pre-7.5 systems that did not have the Drag Manager extension installed. Most likely, you would only see this with system 7.1.2, but it was possible on other earlier 7.x systems.

4) If there is more than one At Ease server in your AppleTalk zone, and one of the servers was not set up properly, there would be a chance that the very first time you ran the At Ease Administration program on a given system that it would locate the not-setup machine and not allow you to administer the other machine.

5) If, when printing the activity log file, there was one or more applications that the administration program did not recognize, the print out (or export) would not include the signature, even though the screen display would show it (for example, creator 'chzr').

6) If a user logged into a restricted Finder workgroup that wasn't using desktop printers (that is, by using either the current Chooser selection, or no printers options instead), but there happen to be desktop printers on the desktop, they were not removed.

7) Fixed a problem with some routers where the machine would hang when trying to obtain the zone list. This normally occurred only if the local network had multiple AppleTalk zones.

8) Fixed problems involving removable media with restricted Finder workgroups.

9) Fixed a problem where workgroup administrators could not remove items left in the hand in folder's by users in the restricted Finder environment. The administrator can now delete these items.

10) Fixed a problem when using LaserWriter 8.4 desktop printers; panels users could change to any desktop printer in the Print dialog even if the workgroup did not have access to previously installed printers.

11) Fixed a printing problem with LaserWriter 300 printers using Printer Share.

12) When using the "Copy Internet Preferences" feature, if a user logs into an unrestricted Finder workgroup, internet preferences will now be copied back to the server when the user logs out.

13) Users can no longer access the At Ease Items WG folder located on the server volume. This normally only affects restricted Finder workgroup users that have their workgroup data server volume set to be the same as the At Ease server volume.

Minor or Cosmetic Changes

1) Some dialogs that referred to "floppy disks" that should have said "removable media" have been changed.

2) Cosmetic change to the administration program's Location pane when editing a workgroup. The text that said "Allow applications to be opened from removable media" has been changed to say "Allow any applications..." since it was unclear that this option allowed all applications, not just applications added to the workgroup, to be opened from removable media.

3) When importing users in At Ease, a minor problem was fixed where you could sometimes single click on items in the Available Fields list to add it to the Imported Fields list.

4) If the minimum password length was greater than seven, and you edited an existing user in the administration program, an erroneous alert would be displayed which required you to re-enter the password again.

5) Removable media volumes (other than floppies) now show a "floppy" icon instead of a "hard disk" icon in the Eject disk dialog.

6) The At Ease Administration's Activity Log and Disk Space windows did not properly track the mouse click in the close box of the window.

7) On PowerPC machines, the At Ease Administration application now shows color icons when displaying them in the Items pane of the workgroup setup.

Energy Saver 2.0.x and Monitor Sleep Modes (12/96)

Revised: 2/17/97
Security: Everyone

Energy Saver 2.0.x and Monitor Sleep Modes (12/96)

=====

Article Created: 6 December 1996

TOPIC -----

I have noticed that my 15-inch Multiple Scan Display does not seem to go into sleep mode with Energy Saver 2.0.x. The screen goes black but the power indicator does not change to indicate the monitor is asleep. At this point, just moving the mouse will wake up the system.

If I choose Sleep from the Special menu, the monitor does go into sleep mode and the system will only wake up when a key is pressed. What is going on?

DISCUSSION -----

This will happen if you are using the separate timings for monitor sleep, system sleep, and hard drive spin down in the Energy Saver control panel. If the monitor is set to sleep before the system is set to sleep, the monitor is put into suspend mode. That is the video is turned off but one of the sync lines is still active to keep the monitor awake. The system itself is still functioning and moving the mouse or pressing a key will cause the video to return instantly. This is more of a screen saver feature than an energy saving feature although it does save some energy.

If the system continues idle for the amount of time set for system sleep, the monitor will be put into sleep mode. Actually, the whole system will be put to sleep. Selecting Sleep from the Special menu also puts the whole system to sleep. A key must be pressed to wake up the system at this point.

Can HD SC Setup or Drive Setup Format Any Disk (12/96)

Revised: 12/11/96
Security: Everyone

Can HD SC Setup or Drive Setup Format Any Disk (12/96)

=====

Article Created: 6 December 1996

TOPIC -----

Can I format any disk with Apple HD SC Setup or Drive Setup?

DISCUSSION -----

No. Hard disks that Apple builds into their products include a firmware response, which identifies the disk as an Apple-supplied disk, and is used in communicating with Apple's formatting utilities. Third-party disks normally do not identify themselves as being produced by Apple. Apple formatting software will therefore dim the format, initialize, or update functions when a non-Apple disk is selected for actions in the utility.

For this reason, when replacing or adding either an internal, or external disks to your Macintosh, Apple recommends choosing a third-party formatting utility that can initialize and update any disk.

An exception to the above is in the A/UX environment. The version of Apple HD SC Setup provided with A/UX does not check for the Apple disk firmware response. This is because in a UNIX environment, third-party disks are frequently used for expansion so the Apple disk identification was bypassed.

When to Update Hard Disk Drivers: General Tips (12/96)

Revised: 12/6/96
Security: Everyone

When to Update Hard Disk Drivers: General Tips (12/96)

=====

Article Created: 6 December 1996

TOPIC -----

When should I use the update driver function of my disk formatting software?

DISCUSSION -----

All Macintosh hard disks contain a small partition containing low level drive support code, that is instructions that are loaded into memory at start up time to support the functions of the hard disk.

If your hard disk does not mount on the desktop normally, updating the driver with your formatting utility may be the solution.

Other strange or unexplainable problems with hard drives, can sometime be cleared up by updating the hard disk drivers.

As a general rule, you should use the same formatting utility to update the drivers as you used to format the disk originally. If you are updating drivers with a different utility, you should backup existing data when possible and consult the vendor of the new utility to see if the old drivers can safely be replaced by their new driver. Drives with multiple partitions could be at risk of data loss.

Macintosh Performa 6360 & 6400: Can't Update Driver (2/97)

Revised: 2/25/97
Security: Everyone

Macintosh Performa 6360 & 6400: Can't Update Driver (2/97)

=====

Article Created: 6 December 1996
Article Review/Update: 25 February 1997

TOPIC -----

I am unable to use Drive Setup (v1.1) to update the hard disk driver on any Macintosh Performa 6360 or 6400 series computer because the Update option under the Functions menu is disabled. Why is the Update option disabled? How can I update the driver on these computers?

DISCUSSION -----

The Update option is disabled because Drive Setup has detected that a newer version of the driver is already installed on the hard drive.

In manufacturing, Apple uses a software loading system which loads the driver onto the hard drive. Since the SCSI issues corrected in the 6360/64xx/54xx Update disk were found and corrected, Apple included the driver update into the manufacturing process.

Future versions of Drive Setup will incorporate the new driver. Until this version Drive Setup is available, if you need to reinstall your driver you will need to reformat the hard drive with Drive Setup 1.1 and then install the 6360/64xx/54xx Update disk. The 6360/64xx/54xx Update disk is available from the Apple Software Updates areas on the online services and Internet.

The 6360/64xx/54xx Update fixes have been rolled into Mac OS 7.6. If you have installed Mac OS 7.6, you do not need the 6360/64xx/54xx Update.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online

services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Megaphone: Answers Calls When Computers Are Asleep (12/96)

Revised: 12/6/96
Security: Everyone

Megaphone: Answers Calls When Computers Are Asleep (12/96)

=====

Article Created: 6 December 1996

TOPIC -----

If a Macintosh Performa 6360 or 6400 series computer is set to Sleep (from the Special menu or through Energy Saver), will Megaphone still answer calls?

DISCUSSION -----

Yes, provided that Megaphone is open, Megaphone will wake up the computer and answer the call; the hard drive spins up to allow Megaphone to record the message. Also, for more reliable performance, verify that Megaphone is set to be the front-most application when the telephone rings.

To do this using Megaphone 2.0.3P and 2.0.5P, follow these steps:

Step 1

Open Megaphone.

Step 2

Choose Preferences from the File menu

Step 3

Choose "Incoming Calls" from the Topic: pop-up menu.

Step 4

Click on the "Come to Front when Ringing" check-box.

Apple VideoPhone Kit: Description (12/96)

Revised: 12/9/96
Security: Everyone

Apple VideoPhone Kit: Description (12/96)

=====

Article Created: 9 December 1996

TOPIC -----

This article contains the product description for the Apple VideoPhone Kit (M5673LL/A), which is only available to U.S. K-12 educational Institutions.

DISCUSSION -----

At the MacWorld Expo in San Francisco, January 1997, Apple will formally announce the Apple VideoPhone Kit. This product appears on the November 16, 1996 Price List Addendum and will be available for ordering at that time.

The Apple VideoPhone Kit is value-packed with a high resolution color camera, Apple VideoPhone videoconferencing and collaboration software, Farallon's Timbuktu Pro, and Macintosh System Software 7.5.5.

Features

=====

- Provides videoconferencing capability to most Performa and Power Macintosh users.
- Interoperability with Windows and UNIX via Netscape's CoolTalk technology.
- Multi-use color digital camera; use the camera to conduct videoconferences, capture raw video footage, take still photos, and even use it to make movies.
- Color videoconferencing and document sharing for users with ISDN (56k/sec) or faster connection to the Internet, or an Ethernet network.
- Audioconferencing and collaboration for users with a 28.8 modem connection to the Internet.
- File Transfer, Shared Whiteboard, Chat Tool.

- Apple Macintosh System Software 7.5.5 included.
- Farallon's Timbuktu Pro document-sharing software included.

System Requirements

=====

- Apple VideoPhone Kit is optimized for use with the following computers: Power Macintosh 6100 series, 7100 series, 8100 series, 7500 series, 7600 series, 8500 series. Performa 5400 series, 6400 series, and the Performa 6360.
- An Apple AV card is needed to enable video capability.
- 16MB RAM
- A 28.8 modem Internet connection or faster, or an Ethernet network connection
- At each end, users must have either an Apple VideoPhone or another video conferencing solution compatible with Apple VideoPhone (such as Netscape's CoolTalk conferencing products).

Features and Benefits

=====

- You can stay in touch with family, friends, and colleagues easily and affordably with Apple VideoPhone Kit. With a 28.8 modem and connection to the Internet, you can use Apple VideoPhone Kit and your computer to call anyone, anywhere in the world without incurring long-distance phone charges.
- Apple's user-friendly design makes it easy to share photos, send live video images, transfer data files, and type "chat" messages back and forth while an audioconference is in session. Customers can even talk to Windows and UNIX users since Apple VideoPhone Kit is compatible with Netscape Communication's CoolTalk cross-platform conferencing software.
- A higher speed Internet connection (128 kps ISDN modem speed, or faster) turns Apple VideoPhone Kit into a value-packed productivity tool.
- Educators can eliminate the downtime and expense of travel by collaborating on projects while videoconferencing with up to four people using Farallon's Timbuktu Pro (included with the purchase of the Apple VideoPhone Kit). They can increase their savings by using Apple VideoPhone Kit to quickly electronically distribute large graphics files and presentations while they videoconference.
- In addition to quarter-screen, 15-25 frames-per-second videoconferencing, the Apple VideoPhone Kit's high resolution color camera can be used to add video clips to presentations and websites, take photographs, and make movies with Apple Video Player software (included with the purchase of the VideoPhone Kit).

LaserWriter 12/640 PS: Solaris 2.5 Print Queue Config. (12/96)

Revised: 12/10/96
Security: Everyone

LaserWriter 12/640 PS: Solaris 2.5 Print Queue Config. (12/96)

=====

Article Created: 10 December 1996

TOPIC -----

The manual for the LaserWriter 12/640 PS includes information for setting up print queues for Sun Solaris that does not seem to match my Solaris 2.5.x environment. How can I get this setup properly?

DISCUSSION -----

The configuration steps in the manual reflect an earlier version of Solaris which was current when the manual was composed. In the interim, new releases of Solaris have included changes to the Print Manager. The following steps for print queue configuration have been modified to match Solaris 2.5.x:

Step 1

Log in as root.

Step 2

Assign an IP address to the printer as described in the manual in "Step 3: Assigning an IP Address to the Printer,".

Step 3

Make sure the printer's IP name and IP address are entered in the /etc/hosts file.

Step 4

Run admintool.

Step 5

Select Print Manager.

Step 6

From the Browse menu, choose Printers.

Step 7

From the Edit menu, choose Add and then Access to Printer.

Step 8

Enter the queue name that you want to use in the Printer Name field.

Step 9

Enter the printer's IP name in the Print Server field.

Step 10

Click Add.

Step 11

In a command shell execute the following command:

lpsadmin -p <queue name> -s<printer's IP name>!postscript

Step 12

Exit admintool and test the installation by printing a file.

PC Compatibility Card: HP PostScript Printer Issue W/Win95 12/96

Revised: 12/10/96
Security: Everyone

PC Compatibility Card: HP PostScript Printer Issue W/Win95 12/96

Article Created: 10 December 1996

TOPIC -----

I have a PC Compatibility Card running Windows 95 in my Macintosh computer. I also have a Hewlett-Packard PostScript printer connected to my computer. When I print from the Mac OS, it prints correctly. When I print from Windows 95, I get several pages of odd-looking text. I am using a PostScript version of the printer driver for my HP printer.

DISCUSSION -----

This occurs with some Hewlett Packard printers that support both PCL and PostScript, including the following printers:

- LaserJet 6 Series w/ PostScript
- LaserJet 5 Series w/ PostScript
- LaserJet 4 Series w/ PostScript
- DeskJet 1600C/CM
- DeskJet 1200C/PS

The Windows 95 printer drivers for these printers include non-PostScript information called a PJP (Printer Job Language) header that causes the PC Compatibility Card to incorrectly print the PostScript code.

Identification

If the first line of every print job contains the letters "PJP", you are experiencing this issue.

Workaround

Configure the printer driver to not send a PJP header with each print job by setting the printer driver to "archive format". Follow these steps to set the driver to archive format:

Step 1

Open the Properties window for the HP printer driver.

Step 2

Select the PostScript tab.

Step 3

Change the 'PostScript output format' option to 'Archive format'.

Step 4

Click 'OK'.

Apple Internet Dialer and AOL Link Extension (12/96)

Revised: 12/10/96
Security: Everyone

Apple Internet Dialer and AOL Link Extension (12/96)

=====

Article Created: 10 December 1996

TOPIC -----

My Performa computer came with AOL (America Online) 2.7 and AICK (Apple Internet Connection Kit) pre-installed, and I can connect with both without a problem. However, when connecting to AOL I am encouraged to download AOL 3.0. After installing AOL 3.0, the Apple Internet Dialer does not work properly, are there any workarounds?

DISCUSSION -----

AOL 3.0 installs the AOL Link extension, which conflicts with the Apple Internet Dialer.

Here are some workarounds:

If you no longer want to use AOL 3.0

Click and drag the AOL Link extension from the Extensions folder to the desktop, restart the computer, and try the Apple Internet Dialer again. Removing the AOL Link extension does not disable AOL entirely, but it does nullify the benefits of the AOL Link extension.

If you want to continue using AOL 3.0

Insert a tilde(~) character at the beginning of the extension name, for example, ~AOL Link. When you want to use AOL, an error message appears indicating that AOL Link needs to load first, AOL will then make the needed changes (requiring a couple computer restarts) and then let you proceed. At the end of the AOL session, AOL will ask if you want to restore your provider information to it's original configuration -- select yes, restart the computer and the Apple Internet Dialer should function normally.

GVC Platinum Modem: Error Correction & Data Compression (12/96)

Revised: 12/10/96
Security: Everyone

GVC Platinum Modem: Error Correction & Data Compression (12/96)

=====

Article Created: 10 December 1996

TOPIC -----

How can I set error correction and data compression modes on the Global Village Platinum V modem, which was included with my Macintosh Performa 6400 series computer?

DISCUSSION -----

To set those, you will need to use the Communications module within ClarisWorks to issue AT commands, which are described on pages 47 and 48 of the TelePort User's Guide. Below is a summary of these commands:

%C0 Disables data compression.
%C1 Enables MNP 5 data compression
%C2 Enables V.42 bis data compression.
%C3 Enables both V.42bis and MNP 5 data compression (factory default)

\N0 Selects normal speed buffered mode; no error correction.
\N1 Selects direct mode and is equivalent to &M0 and &Q0.
\N2 The modem will first attempt a LAP-M connection and then an MNP connection.
\N3 Same as \N2, except failure falls back \N0. Factory default.
\N4 Tries to establish LAP-M correction; if failure, modem hangs up.
\N5 MNP mode. Failure to make an MNP connection results in the modem hanging up.

Apple Multiple Scan 15AV Display: Description (12/96)

Revised: 12/11/96
Security: Everyone

Apple Multiple Scan 15AV Display: Description (12/96)

=====

Article Created: 11 December 1996

TOPIC -----

This article contains the product description for the Apple Multiple Scan 15AV Display.

DISCUSSION -----

The Apple Multiple Scan 15AV Display is a high-quality, yet affordable, half-page monitor that's perfect for consumer and education users. It features a sleek new design and offers a host of advanced features to complement the capabilities of your Macintosh Performa, Power Macintosh, or Macintosh PowerBook system. (With the addition of an adapter, it can also be used with PCs running Windows.)

Featuring a flat, square shadow mask screen that provides a larger viewing area than many other 15-inch monitors (13.75-inch viewable image size), the Apple Multiple Scan 15AV Display offers outstanding video performance, including ColorSync profiles for precise color matching. Because it's based on multiple-scan technology, this display lets you select the resolution that best suits the application in which you are working. For example, you might select a lower resolution to work on a presentation or view a QuickTime movie, and then switch to a higher resolution to check on the details of a page-layout document without having to restart your system. And the Apple Multiple Scan 15AV Display's front-facing integrated stereo speakers and front-panel headphone jack make it ideal for working with multimedia.

The Apple Multiple Scan 15AV Display is both simple to set up and enjoyable to use. To minimize static electricity buildup and distortion, it features an advanced antistatic, anti-glare coating. Its conveniently located controls let you adjust brightness, contrast, speaker volume, horizontal/vertical size, and centering for optimal viewing performance. And it complies with the Environmental Protection Agency's Energy Star guidelines for power conservation.

Yet even with all of these features, the Apple Multiple Scan 15AV Display

remains affordable making it the perfect choice for users whose work requires a high-quality, flexible, color viewing solution.

Features

=====

Outstanding image quality

- Features a high-quality flat, square shadow mask screen for clear, sharp pictures with true colors and a larger viewing area than many 15-inch displays (13.75-inch diagonal viewable image size)
- Provides excellent brightness, contrast, convergence, focus, and white uniformity
- Decreases reflections and distortion through its antistatic, antiglare coating
- Includes front-panel digital controls and knobs that let you precisely adjust screen size, position, brightness, contrast, and speaker volume

Multimedia Integration

- Includes front-facing, CD-quality stereo speakers
- Comes with a front-panel headphone jack
- Supports the advanced multimedia features of Macintosh Performa and Power Macintosh computers

Advanced functionality

- Uses multiple-scan electronics that enable a high level of user flexibility
- Offers a range of resolution modes for Macintosh and IBM PC compatible systems: 640 by 480 pixels to 1,024 by 768 pixels*

NOTE: * Please check to make sure the video capabilities of your CPU support monitor resolutions.

- Comes with mode-switching software for Macintosh to allow resolution changes without restarting

Attractive, Ergonomic Design

- Comes with a tilt-and-swivel base that allows you to position the monitor for optimal viewing comfort
- Complies fully with MPR II standards for low electrical and magnetic emissions

..TIL20729-Apple_Multiple_Scan_15AV_Display-Description_12-96.pdf

- Complies with the EPA's Energy Star conservation guidelines by switching into low-power mode during idle periods

Compatibility and Affordability

- Works with Macintosh Performa, Power Macintosh, and Macintosh PowerBook computers, as well as with PCs running Windows (requires Macintosh-to-VGA Adapter)
- Provides advanced capabilities at an affordable price

System Requirements

- Macintosh Performa, Power Macintosh, or Macintosh PowerBook computer
- System software version 7.1 or later
- Cable adapter required for use with some earlier Macintosh models and with Macintosh PowerBook computers; Macintosh-to-VGA Adapter required for use with PCs running Windows

Ordering Information

- Apple Multiple Scan 15AV Display Order No. MN4614LL/A
 - Apple Multiple Scan 15AV Display
 - Apple Multiple Scan and ColorSync software for Macintosh
 - Video cable (attached)
 - Audio cable
 - User's guide
 - Limited warranty
- Macintosh-to-VGA Adapter Order No. MM2612LL/A

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

DISCUSSION -----

Technical Specifications
=====

Picture Tube

- 15-in. (diagonal) flat, square shadow mask
- 13.75-in. diagonal viewable image size
- 0.28-mm dot pitch

Resolution

Macintosh computers

- 640x480 pixels at 60 and 67 Hz
- 800x600 pixels at 60 and 72 Hz
- 832x624 pixels at 75 Hz
- 1,024x768 pixels at 60, 70, and 75 Hz

IBM PC compatible systems

- 640 by 480 pixels at 60 Hz (VGA)
- 800 by 600 pixels at 60 and 72 Hz (SVGA)
- 1,024 by 768 pixels at 60, 70, and 75 Hz (SVGA)

Scanning Rates

- 30 to 56.5 kHz (horizontal)
- 56 to 75 Hz (vertical)

Screen Treatment

- Antistatic, antiglare coating

Controls

- Brightness
- Contrast
- Horizontal size and centering
- Vertical size and centering
- Speaker volume
- Power switch

Connector

- 15-pin DSub connector for Macintosh systems

Degauss Circuitry

- Automatic at power up

Electrical Requirements

- Line voltage: 90 to 132 volts AC and 198 to 265 volts AC
- Frequency: 43 to 63 Hz, single phase
- Power: 75 W (maximum) when operating, less than 8 W in energy-saver mode

Environmental Requirements

- Temperature: 50 deg. to 104 deg. F (10 to 40 deg. C)
- Humidity: 90% maximum, noncondensing
- Altitude: 0 to 10,000 ft. (0 to 3,048 m)

Size and Weight

- Height: 16.1 in. (40.9 cm) (includes tilt/swivel stand)
- Width: 17.3 in. (44.0 cm)
- Depth: 16.0 in. (40.7 cm)
- Weight: 30 lb. (13.5 kg)

Agency Approvals

- FCC Part 15 Class B
- CISPR 22 Class B (EN5008211) complies with European EMC directive
- DOC Class B
- MPR II
- VCCI Class 2
- CE Mark
- EPA Energy Star compliant
- IEC 950
- UL1950
- CSA 950

- EN60950

Audio

- Response: 50 Hz 20,000 kHz
- Output: 2 W
- SPL: 82 db @ 1 kHz, 1 m

System Requirements

=====

- Macintosh Performa, Power Macintosh, or Macintosh PowerBook computer
- System software version 7.1 or later
- Cable adapter required for use with some earlier Macintosh models and with Macintosh PowerBook computers; Macintosh-to-VGA Adapter required for use with PCs running Windows

Ordering Information

=====

- Apple Multiple Scan 15AV Display Order No. MN4614LL/A

LaserWriter 8.4: Changing the Default Paper Size (12/96)

Revised: 12/19/96
Security: Everyone

LaserWriter 8.4: Changing the Default Paper Size (12/96)

Article Created: 12 December 1996
Article Reviewed/Updated: 19 December 1996

TOPIC -----

I recently installed the LaserWriter 8.4.x printer software, and now when I print US Letter Small is the default paper size. Is there a way to change this?

DISCUSSION -----

Some printers support both US Letter and US Letter Small paper sizes. To prevent text from clipping or wrapping to the next line on different printers, Apple recommends using US Letter Small. In the LaserWriter 8.4.x printer driver, the default paper size was changed to US Letter Small. Use the steps below to change the default paper size. There are some applications will not save the changes to the default paper size. This is application specific, so you may or may not be able to change the default paper size.

Step 1

Choose Page Setup from the File menu.

Step 2

Change the paper size, and any other selections you want to have for your printing defaults.

Step 3

Press and hold the Option key, then click OK.

A dialog appears verifying that the setting you just made are what you want to be your default printing settings.

Step 4

Click OK

LC Ethernet Card: Wasn't tested in all Power Mac Computers 12/96

Revised: 12/12/96
Security: Everyone

LC Ethernet Card: Wasn't tested in all Power Mac Computers 12/96

=====

Article Created: 12 December 1996

TOPIC -----

I recently upgraded from a Macintosh LC III to a Power Macintosh 6200 series computer. Can I use my PDS Ethernet card in my new computer?

DISCUSSION -----

Apple has not tested the Apple Ethernet LC Card (M0443LL/B) in every Power Macintosh computer with an LC-style Processor Direct Slot (PDS). The LC PDS Ethernet cards fit, and you should not have any problems using them, but they were not tested in every Power Macintosh computer.

Open Transport 1.1.2 Read Me - Part 1 (5/97)

Revised: 5/1/97
Security: Everyone

Open Transport 1.1.2 Read Me - Part 1 (5/97)

=====

Article Created: 16 December 1996
Article Reviewed/Updated: 1 May 1997

TOPIC -----

This article is the Open Transport 1.1.2 ReadMe - Part 1 file.

DISCUSSION -----

Introduction

This Read Me document contains late-breaking information about Open Transport compatibility, add-on software, and solutions to known problems with third-party software. For instructions about how to use the Open Transport control panels (AppleTalk and TCP/IP), see the Open Transport User's Guide. For additional technical information about Open Transport, see the "Open Transport Technical Info" file that came with Open Transport.

Contents

- License agreement
- What's new in Open Transport 1.1.2 - general
- Network interface options
- Before you install Open Transport 1.1.2

- General compatibility
- Apple product compatibility update
- Dialup network connectivity - AppleTalk
- Dialup network connectivity - TCP/IP
- Native dialup network connectivity - TCP/IP
- Tips for SLIP and PPP configurations
- Known limitations and other issues
- System 7.5.3 notes
- System 7.5.5 notes

License agreement

This release of Open Transport is subject to the terms and conditions of the license agreement that accompanies the software in the file "LICENSE." By downloading the software you agree to abide by the terms and conditions of the license agreement.

What's new in Open Transport 1.1.2 - general

- Fixes a performance problem which only affects Print Server Developers using native PAP.
- Introduces a change to TCP that should provide a minor increase in Web servers reusing TCP connections. Open Transport will now unbind while the 2 minute disconnect timer is expiring.
- Fixes a problem with the Open Transport serial STREAMS module that could cause a crash. The crash could result if the modem was turned off, hung, or unresponsive while a connection was attempted with OT/PPP.
- Fixes a problem where disconnecting with MacPPP 2.5.1 could cause a crash if QuickTime Conferencing was running and waiting for connections.
- Includes minor modifications to improve performance, compatibility and reliability.

System requirements

Open Transport is designed to work on Mac OS-compatible computers with a Motorola 68030 or 68040 family microprocessor, or a PowerPC microprocessor. Open Transport is supported on system software versions 7.1, 7.1.1, 7.1.2, 7.5.3, 7.5.5 or later. System software version 7.5.3 or later is recommended. No other system software versions are supported.

Open Transport 1.1.2 can be used on Apple Power Macintosh 5200/75 LC and 5300/100 LC, and Macintosh Performa 5200, 5215, 5300, 6200, 6205, 6214, 6216, 6218, 6220, 6230, 6290 and 6300. (The recently introduced Power Macintosh 5260 and 6320 are not included in this because all known issues were fixed prior to manufacturing.) When you install OT 1.1.2 on a these 52xx, 53xx, 62xx and 63xx models you may get a dialog box indicating a hardware issue was detected. If this alert is displayed, Open Transport cannot be installed or loaded until the Cache/ROM DIMM is replaced. Your computer will continue to run classic networking. The required repairs are covered under the Apple repair extension program. Please contact an Apple-authorized service provider to have your computer repaired.

Open Transport requires a minimum of 5 MB of RAM (68030 or 68040 computers) or 8 MB of RAM (PowerPC-based computers). Open Transport memory requirements are based on total system memory including virtual memory, minus the size of any RAM disk and disk cache you're using.

Network interface options

Open Transport 1.1.2 supports PCI bus, NuBus, communications slot, and PC Card network interface cards, as well as built-in LocalTalk, Ethernet, and Token Ring network adapters. For supported computers without expansion options, Open Transport 1.1.2 also supports a SCSI-attached network adapter. Third party network interface options available for Open Transport include Fast Ethernet, ATM, and FDDI.

Before you install Open Transport 1.1.2

- Read the section "Known limitations and other issues" below to make sure Open Transport 1.1.2 will work on your computer.
- Make backup copies of the software and documents on your hard disk (especially your System Folder) before installing this software.
- For best results, you should install Open Transport 1.1.2 over Open Transport 1.1 or Open Transport 1.1.1, but not over any beta version of Open Transport.
- Turn on only those extensions installed with your system software. (Open the Extensions Manager control panel and select System 7.5.3 or 7.5.5 from the Sets pop-up menu, then restart your computer.) Do not turn off all extensions before installing Open Transport.
- Performa and Power Macintosh 52xx, 53xx, 62xx and 63xx models using System 7.5.3 or later can install Open Transport 1.1.2 directly. Other supported systems must install Open Transport 1.1 or have Open Transport 1.1.1 on system software version 7.1, 7.1.1, 7.1.2 , 7.5.3, or 7.5.5 before updating to Open Transport 1.1.2.
- If you use SLIP or PPP software to access the Internet, verify that your SLIP or PPP software is compatible with Open Transport. See the section under "Dialup network connectivity - TCP/IP."
- When Open Transport is installed, the Network control panel is replaced by the AppleTalk configuration utility program. The MacTCP control panel is replaced by the TCP/IP configuration utility program. Both AppleTalk and TCP/IP are located in the Control Panels folder. For simplicity and consistency, user documentation generally refers to AppleTalk and TCP/IP as "control panels" even though technically they are utility programs.
- You should download a copy of System 7.5 Update 2.0 to your hard disk or have a copy of the Open Transport 1.1 retail package or Open Transport 1.1.1 Internet GM package available. This will give you the software to reinstall Open Transport 1.1 or Open Transport 1.1.1 in case you decide to remove Open Transport 1.1.2.

How to turn off or remove Open Transport 1.1.2

Switching to Classic Networking

If your computer does not have a PCI bus, and is using system software version 7.5.3 or 7.5.5, you can use the Network Software Selector (NSS) utility to turn on classic networking instead of Open Transport. The NSS utility is installed in the Apple Extras folder when you install System Update 2.0. After selecting

classic networking, close NSS and restart your computer. When your computer starts up again, open the Network control panel and choose the network connection you want to use.

Removing Open Transport with the Installer

You can remove Open Transport software with the Custom Remove option in the Installer. However, the Custom Remove option removes a file called the Apple Shared Library Manager (ASLM). If any previous version of ASLM was installed, it was automatically updated to version 2.0.1 when you installed Open Transport 1.1.2. When you remove Open Transport, your previous version of ASLM is not automatically restored.

After removing Open Transport 1.1.2, you must reinstall any applications that rely on ASLM. Reinstalling these applications will install the required ASLM files.

To remove Open Transport 1.1.2 using the Installer, follow these steps:

1. Open the Installer included with Open Transport 1.1.2. The Welcome screen appears.
2. Click OK.
3. In the window that appears, choose Custom Remove from the pop-up menu in the upper-left corner.
4. In the list that appears, click the box next to Open Transport so an 'X' appears in it.
5. Click Remove. If a window appears asking you whether to quit any open applications, click Continue. A window will appear telling you to restart your computer.
6. Click Restart.
7. On a Power Macintosh system with PCI bus, you will then need to reinstall Open Transport 1.1 software using either (1) the System 7.5, Update 2.0 installer, (2) the Open Transport 1.1 installer, or (3) a system software CD. If you use the system update installer or the system software that came with your computer, perform a custom install of the network software.
8. On a Macintosh system without PCI bus, classic networking will be restored and made active.

Open Transport Extras Folder

• This release also contains an Open Transport Extras folder which includes for your convenience:

- Claris EMailer updaters
- MacPPP 2.5 software files
- Remote Only ADEV software
- Network Options for AppleTalk & TCP/IP
- the Open Transport Reference Q & A
- the Open Transport User's Guide

General compatibility

Open Transport is compatible with:

- existing applications that use AppleTalk as specified by Apple Computer, Inc.
- existing applications that use MacTCP as specified by Apple Computer, Inc.
- existing devices (such as printers) that you select in the Chooser
- existing NuBus network interface cards for the Mac OS

Computers running Open Transport can be added to an existing AppleTalk or TCP/IP network without upgrading other computers on the network.

Apple product compatibility update

• At Ease version 2.x or 3.x may encounter problems when starting up with Open Transport. At Ease Update 1.0 will update non-Workgroup versions of At Ease 2.x or 3.x to include Open Transport compatibility. If you are using At Ease for Workgroups, you should upgrade to version 3.0.2 or later. Both can be found on Apple Software Update sites on the Internet and selected online services.

• Assistant Toolbox version 1.2 is not compatible with Open Transport, and will result in AppleTalk being turned off each time you restart your system. System 7.5 update 2.0 and 7.5.5 includes Assistant Toolbox version 1.3 or later that is compatible with Open Transport.

• The Apple PCI Token Ring Card (M3904Z/A) requires Open Transport 1.1 or later. The Apple PCI Token Ring card is compatible with Power Macintosh 7500, 8500 and 9500 computers; it is not compatible with 7200/75 and 7200/90 computers.

• Apple LaserWriter Bridge and LocalTalk Bridge 2.1 or later are compatible with Open Transport.

• Apple Internet Dialer 1.0, part of the Apple Internet Connection Kit 1.0 (stock number M4276LL/A), is not fully compatible with System 7.5.3. This is corrected in AICK 1.1 (stock number 504081U). AICK customers with version 1.0 can update their software by downloading a "patcher" from the Apple Internet Connection Kit home page, available at <<http://aick.apple.com/>>.

• Apple Internet Mail Server 1.1 or later software is compatible with Open Transport 1.1 and later. System Update 2.0 (System 7.5.3) is strongly recommended.

• Apple Remote Access (ARA) Multiport Server 2.1, ARA Client 2.0.1, and ARA Personal Server 2.0.1 are compatible with Open Transport 1.1 and later.

• Apple PCI-based Workgroup servers (Application, AppleShare, and Internet) are compatible with Open Transport 1.1 or later.

• Computers running the current versions of Apple IP Gateway and AppleTalk Internet Router must not be updated to Open Transport; these products are based on classic networking. These products do, however, interoperate with computers using either classic or Open Transport networking. Apple has not yet announced plans regarding future versions of these products.

• Apple's MacTCP Ping is not compatible with Open Transport; no update is

planned. MacPing from Dartmouth, available at [<ftp://www.dartmouth.edu/pages/softdev/>](ftp://www.dartmouth.edu/pages/softdev/), OTTool from Neon Software, available at [<ftp://ftp.neon.com>](ftp://ftp.neon.com) and Mac TCP Watcher v2.0 from Peter N. Lewis & Stairways Software available at [<ftp://ftp.share.com>](ftp://ftp.share.com) are Open Transport-compatible alternatives.

- ZapTCP is a classic networking tool and is neither compatible nor needed with Open Transport. Functionality similar to ZapTCP is built into Open Transport.

Dialup network connectivity - AppleTalk

For dialup connectivity to AppleTalk networks, Open Transport supports Apple Remote Access version 2.0.1 or later.

Dialup network connectivity - TCP/IP

For dialup connectivity to TCP/IP networks (including the Internet) Open Transport supports third-party extensions known as "MDEVs." Serial Line Interface Protocol (SLIP) and Point to Point Protocol (PPP) connectivity are provided in this manner. Not all versions of all MDEVs are compatible with Open Transport 1.1 and later.

Open Transport 1.1 and later recognizes and is compatible with the following MDEVs. When properly installed they appear in the "Connect via" pop-up menu in the TCP/IP control panel.

- FreePPP - version 1.0.5 or later

FreePPP is shareware and can be found on the Internet, typically at "info-mac" mirror sites in the comm/tcp/conn directory. A list of info-mac mirror sites can currently be found at:

[<http://www.pht.com/info-mac/mirror-list.html>](http://www.pht.com/info-mac/mirror-list.html)

Some sites where FreePPP can be found currently include:

[<ftp://mirrors.aol.com/pub/info-mac/comm/tcp/conn/>](ftp://mirrors.aol.com/pub/info-mac/comm/tcp/conn/)

[<ftp://mirror.apple.com/mirrors/Info-Mac.Archive/comm/tcp/conn/>](ftp://mirror.apple.com/mirrors/Info-Mac.Archive/comm/tcp/conn/)

FreePPP versions prior to 2.5 may experience problems when running with virtual memory turned on (including RAM Doubler). If you have problems using FreePPP with VM, either update to FreePPP 2.5, or temporarily turn VM off. The current version of FreePPP is 2.5v2.

- MacPPP - version 2.1.4 or later (MacPPP 2.5 is recommended)

MacPPP versions prior to 2.5 may experience problems when running with virtual memory turned on (including RAM Doubler). If you have problems using MacPPP with VM, either update to MacPPP 2.5, or temporarily turn VM off.

An Open Transport-compatible version of MacPPP (MacPPP 2.5) is included in the Open Transport Extras folder. For more information, please refer to the MacPPP Read Me document.

- InterPPP - version 1.2.9 or later; InterPPP II - version 1.1 or later
InterPPP and InterPPP II are commercial software products. For availability and ordering information in the U.S., contact InterCon Systems at 800-468-7266 or 703-709-5500.

- MacSLIP - version 3.0.3 or later

MacSLIP is commercial software developed by Hyde Park Software. For availability and ordering information in the U.S., contact TriSoft at 800-531-5170 or 512-472-0744. For more details see the MacSLIP Web page at <<http://www.zilker.net/~hydepark/>>

- Sonic PPP - version 1.0.2 or later

SonicPPP is commercial software developed by Sonic Systems, Inc. For availability and ordering information in the U.S., contact Sonic Systems at 408-736-1900 (voice) 408-736-7228 (fax). For more details see the Sonic Systems Web page at <<http://www.sonicsys.com/>>

- NTS PPP - 2.0 or later

NTS PPP is commercial software developed by Network Telesystems, Inc. For availability and ordering information in the U.S., contact Network Telesystems at 408-523-8100 (voice) 408-523-8818 (fax). For more details see the Network Telesystems Web page at <<http://www.nts.com/>>

- SAT/SAGEM PPP - 1.02b1 or later

SAT/SAGEM PPP is commercial software developed by SAT/SAGEM. For availability and ordering information in the US, contact SAT/SAGEM at 408-446-8690 (voice) 408-446-9766 (fax). For more details see the SAGEM Web page at <<http://www.satusa.com/>>

- LeoTCP - 2.0.1 or later

LeoTCP is commercial software developed by Hermstedt GmbH. For availability and ordering information in the U.S., contact Hermstedt USA at 1-800-828-5522 (voice). In Europe contact Hermstedt GmbH at +49 621-76500 (voice) +49 621-7650100 (fax).

- T-Online CSLIP - version 1.0.3 or later

T-Online CSLIP is commercial software developed by Computer Consulting GbR. For availability and ordering information in Europe, contact format network & communication at 49 2206 95840. For more details, contact format network & communication at info@format.de.

- University of Michigan ISDN - 2.0.6 or later

In addition to these, there are a number of other MDEVs (examples include those from Pacer, FCR, and Tribe) which are indistinguishable from one another to Open Transport. When installed, these appear in the "Connect via" pop-up menu as "TCP/IP PPP."

Native dialup network connectivity - TCP/IP

- OT/PPP - version 1.0 or later

Open Transport supports extensions that use the STREAMS architecture. OT/PPP is available on the Apple Software Update sites on the Internet and requires Open

Transport 1.1.1 or later.

Article Change History:

01 May 1997 - Added complete product names for Cache/ROM DIMM program.

Revised: 12/16/96
Security: Everyone

Open Transport 1.1.2 Read Me - Part 2 (12/96)

Article Created: 16 December 1996

TOPIC -----

This article is the Open Transport 1.1.2 ReadMe - Part 2 file.

DISCUSSION -----

Tips for SLIP and PPP configurations

- Some MDEVs are known to be incompatible with other MDEVs. If you experience problems, remove unused MDEVs so that only one MDEV is installed on your computer at a time.
- Users who dial into a TCP/IP network or Internet Service Provider (ISP) may have been assigned a router (gateway) address that is not a part of their local subnet. This was an accepted but technically invalid configuration for MacTCP. Open Transport users should not enter a value for the router address or subnet mask; Open Transport/TCP generates correct values for these fields automatically. In unusual circumstances, these supplied values can be overridden using the Administration mode of the TCP/IP control panel.
- If BootP is used over SLIP or PPP for interface configuration, and if BootP returns additional default router addresses, Open Transport will automatically add those addresses to the list of default routers.
- When Open Transport is installed on a computer that previously had MacTCP configured for a server configuration, the initial configuration method—the selection in the "Configure" pop-up menu in the TCP/IP control panel—is set for the use of a BootP server. This default may not be the appropriate choice for you; please verify.
- If your computer was previously configured for MacTCP "server" addressing and you experience connection difficulties using PPP or SLIP after installing Open Transport, follow these steps:

- 1) Open the TCP/IP control panel.
- 2) Choose Using PPP Server or Using SLIP from the Configure pop-up menu.
- 3) Close the TCP/IP control panel, and save changes when prompted.
- 4) Try connecting again.

• If your computer was previously configured for MacTCP "manual" addressing and you experience connection difficulties using PPP or SLIP after installing Open Transport, follow these steps:

- 1) Open the TCP/IP control panel.
- 2) Choose Manual from the Configure pop-up menu.
- 3) Verify that the correct IP address is entered in the Address field.
- 4) Close the TCP/IP control panel, and save changes when prompted.
- 5) Open the configuration utility supplied with your SLIP or PPP software, and verify that it also reflects the correct IP address in the appropriate location. Refer to the documentation supplied with your SLIP or PPP software for further information on how to enter an IP address, and how to save an updated configuration.
- 6) Try connecting again.

NOTE: In MacPPP's ConfigPPP control panel, this setting is entered in the IPCP dialog box. Refer to the documentation that came with MacPPP or FreePPP for additional information.

Known limitations and other issues

- The AppleTalk control panel displays separate printer and modem ports on the PowerBook 190. LocalTalk will only work correctly when the modem port is selected in the AppleTalk control panel.
- The software that dims the screen of PowerBook Duo computers when the PowerBook is docked and idle is not compatible with Open Transport. Use a third-party screen saver in place of the Apple-provided module.
- In some cases, on a PowerBook 190 configured to use the Infrared Port in the AppleTalk "Connect via" pop-up menu, networking services may become disabled following a sleep/wake or restart. If this happens, try putting the computer to sleep and waking it up again, or use the AppleTalk control panel to temporarily select the modem/printer port before switching back to the infrared port.
- On a IIfx or a Quadra 950, Open Transport can only use the "compatible mode" setting in the Serial Switch control panel. Don't use the "faster mode" setting with LocalTalk.
- On 68030 and 68040 computers, changes in AppleTalk configurations can cause systems running Meeting Maker 3.5 or 3.5.1 to crash. This can occur when changing AppleTalk links, turning AppleTalk off, or bringing ARA connections up or down. This problem will occur on classic networking as well. Apple is working with ON Technology to resolve this problem.
- Open Transport generally requires more memory (RAM) than MacTCP. To conserve memory, you might try some of the following:
 - Rename or re-order one or more third-party system extensions (INITs), to

change the order in which memory is allocated when your computer starts up. If you use extensions from Global Village, try renaming those extensions so that they load last.

- Especially on PowerPC-based computers, turn on virtual memory. This may affect performance.
- When TCP/IP is set to "Load only when needed" (in the control panel's Options window), "pinging" an Open Transport workstation will fail if TCP/IP is not currently being used. To make sure your computer is "pingable" at all times, turn off the "Load only when needed" option (open the TCP/IP control panel and click the Options button, then click the "Load only when needed" checkbox to remove the X) and restart your computer.
- When TCP/IP is set to "Load only when needed" (in the control panel's Options window), the first TCP/IP application opened will cause Open Transport to load into memory. Some older applications don't cause Open Transport to load, and then report errors similar to those encountered when MacTCP is not installed. If this is a problem, turn off the "Load only when needed" option (open the TCP/IP control panel and click the Options button, then click the "Load only when needed" checkbox to remove the X) and restart your computer.
- The TCP/IP control panel is able to obtain and utilize multiple gateway and name server addresses from DHCP and BootP servers. However, it will currently display only the first one. This should be addressed in a future release.
- Generally, you should turn on the "Load only when needed" option in the TCP/IP control panel when using a modem. If TCP/IP is always loaded ("Load only when needed" is not checked), your modem may attempt to initiate a dialup connection at startup. Some MDEVs require more system heap memory than is available at startup, which may cause the computer to hang. Also, some Internet service providers charge by connect time, so you may be charged for the connection, even if you weren't using it.
- If you use MacSLIP, you should likewise not configure the MacSLIP control panel to initialize MacSLIP at system startup time. As stated above, this may require more system heap memory than is available at startup, which may cause the computer to hang.
- If you are experiencing problems when using MacSLIP with virtual memory on, increasing your virtual memory size may give you better results. (Use the Memory control panel to increase virtual memory.)
- If you are using Netscape, 16MB or more of built-in memory (RAM) is recommended.
- Some MacTCP-based applications will not function correctly unless the MacTCP DNR file is in its original location at the root level of the System Folder.
- You should only specify use of 802.3 framing in the TCP/IP control panel if you have been directed to do so by your network manager, or if you are sure that all other stations on your network segment, including your IP router(s), are also configured to use 802.3 and not Ethernet version 2.0 framing.

..TIL20735-Open_Transport_1-1-2_Read_Me_-Part_2_12-96_(TA36295).pdf

- Claris EMailer version 1.1 v3 or later and Claris EMailer Lite version 1.1 v4 or later is compatible with Open Transport 1.1.2. Earlier versions of Claris EMailer may not be compatible with Open Transport's "Load only when needed" configuration option. If you experience a system crash 2-3 minutes after quitting EMailer, turn off the "Load only when needed" option. (Open the TCP/IP control panel and click the Options button, then click the "Load only when needed" checkbox to remove the X.)
- The current version of the MacTraceRoute Ethernet LAP does not work on computers running Open Transport.
- NFS/Share versions 1.4.4 or later are compatible with Open Transport.
- When using Netware Client version 5.11 configured for NetwareIP service, the first login may yield a Netware Configuration error message. To avoid this error, open the NetwareIP control panel and change the value under Domain SAP Server (DSS) Retry Attempts from 1 to 2. You can also change OpenTransport TCP/IP control panel to always load TCP/IP into memory (open the TCP/IP control panel, click the Options button, and click the "Load only when needed" box to remove the X).
- eXodus 5.2.2 and later are compatible with Open Transport.
- Versions of Anarchie prior to 1.6 have a data corruption problem when used with Open Transport. Make sure you are using Anarchie 1.6 or later.
- If an Apple Remote Access (ARA) user is on a non-routed, extended (Ethernet) network, and there are devices on the local network with the same network number as devices on the remote network, the user won't be able to see the local devices. This problem can be fixed by installing a router. Another workaround is to clear the PRAM on the ARA computer. (Hold down the Command, Option, and PR keys simultaneously while starting up the computer). Clearing PRAM causes the computer to start up with a new network number, which should not conflict with the remote network number.
- Daemon 1.0.0 & Daemon Killer 1.0 are not compatible with Open Transport.
- MudDweller 1.2 is not completely compatible with Open Transport. You can open new connections, but the "reconnect" choice does not work correctly.
- The system will crash during launch of NetPresenz if Open Transport TCP/IP is configured to use MacIP and the selected zone has no MacIP server.
- Current versions of VersaTerm SLIP are not compatible with Open Transport.
- Problems can occur with old versions of the KeyServer package from Sassafras Software when TCP/IP is configured to "Load only when needed" (in the control panel's Options window). Contact Sassafras for the latest revisions at <<http://www.sassafras.com>>.
- The combination of Open Transport 1.1.2, LocalTalk Bridge 2.1f2, Global Village Toolbox and GlobalFax extensions causes a crash. This also happens when using classic networking. The workaround is to move the LocalTalk Bridge file to

the Extension folder, renaming it to "aLocalTalk Bridge." You can make an alias and rename the alias as desired. Put the alias wherever you want, including the Control Panels folder. This will allow the LocalTalk Bridge to load before Global Village and avoid the cause of the crash.

- To use the CSI Hurdler serial card with Open Transport, contact CSI to get a copy of their preference file patch. This will enable the card to be compatible with Open Transport 1.1.2.
- After installing Open Transport 1.1.2 over a network while using Classic AppleTalk, open the Open Transport 1.1.2 AppleTalk control panel. If you are not using an infrared device, open the "Connect via" pop-up menu and choose Serial Port.
- The current official release of the MPW shell will hang the system when used with virtual memory and Open Transport. When using the MPW shell and Open Transport, turn off virtual memory. The ETO #21 pre-release MPW shell, version 3.4.2b2, fixes this problem.
- Apple is working on acceptable solutions to the following known problems for future versions of Open Transport:
 - TCP "Ping of Death"
 - TCP "Denial of Service Attacks"
 - Differences in WebStar throughput using Open Transport versus MacTCP over low speed lines.

System 7.5.3 notes

- System 7.5.3 includes both classic and Open Transport networking.
- The Network Software Selector (NSS) utility, included in the Apple Extras folder with System 7.5.3, provides an easy way to specify either classic or Open Transport networking. The computer must be restarted for a change to take effect.
- During system startup, System 7.5.3 checks for the stored preference for networking software. The load process then causes the appropriate control panels—"Network" and "MacTCP" for classic networking, "AppleTalk" and "TCP/IP" for Open Transport—to become visible. Those control panels associated with the disabled network software are hidden.
- Prior to installing OT 1.1, it was technically possible to install the older MacTCP on a computer running Open Transport. With OT 1.1 and later this is no longer possible.
- If it becomes necessary to reinstall MacTCP or the Network System Installer (NSI) on a 68030, 68040, or NuBus PowerPC-based computers running System 7.5.3 and Open Transport, you must first use NSS to specify classic networking and restart. After restarting, MacTCP and the other components of classic networking are visible.
- If you have a PCI-based computer connected to a Novell Netware network and are using the Netware 5.1 client software, you should also install the Ethernet

Compatibility extension version 1.0.3. This extension is available only through a Custom Install from the System Update 2.0 installer, selecting the Ethernet Driver Update. This corrects a problem that could cause your system to crash at shutdown when using MacIPX. However, there will be a two-minute delay in shutting down the computer.

- Network Time v2.0.1 is not compatible with the AutoPower On/Off control panel version 1.0 on a NuBus Power Macintosh with Open Transport. To use Network Time v2.0.1, remove the AutoPower On/Off control panel.

System 7.5.5 notes

The System 7.5.5 Update is a set of system software enhancements that improves the reliability and performance of all Macintosh and Mac OS-compatible computers running system software version 7.5.3.

- System 7.5.5 Update includes improved reliability when using Ethernet and virtual memory. If you use Ethernet and have virtual memory turned on, you may have experienced problems transferring large files over Ethernet. System 7.5.5 Update fixes this problem.

- System 7.5.5 Update includes improvements in LocalTalk that provide:

- better reliability on Macintosh 5400 series computers
- better performance when using some third-party infrared software products

- System 7.5.5 Update includes improved reliability when using Ethernet on the Macintosh 5400 and 6400 series computers.

- System 7.5.5 Update includes improved stability when using a shared printer on a network. If your computer crashed when you were trying to use a shared printer on a network, System 7.5.5 Update fixes the problem.

- If you install Apple Telecom 3.0 or Express Modem 3.0 after installing the System 7.5.5 Update you will not be able to switch on your Express Modem. To fix this incompatibility, run the System 7.5.5 Update again. The System 7.5.5 Update updates your Express Modem 3.0 to Express Modem 3.0.1.

- There is a known incompatibility with the Sagem GeoPort ISDN Adapter 1.0 and System 7.5.5 Update, resulting in the inability to use the GeoPort ISDN Adapter. Sagem has been contacted about this problem and is working on a solution. If you have a Sagem GeoPort ISDN Adapter, you should not install the System 7.5.5 Update until Sagem resolves the conflict. For more information, visit the Sagem web site at <<http://www.satusa.com>> or e-mail sathelp@satusa.com.

- Programs use slightly more memory

If you are having new problems with programs reporting that they do not have enough memory, System 7.5.5 Update may require programs to use an additional 23K of memory. To fix the problem:

- 1) Quit the program if it is open.
- 2) Click the program's icon to select it.
- 3) Open the File menu and choose Get Info.

4) In the Info window, increase the value in the "Preferred size" box by 23.

5) Close the window.

- Launching Timbuktu on System Update 7.5.5 with VM "on" from the Timbuktu menu may cause a crash. Workaround is to launch Timbuktu from the Finder instead.

Open Transport 1.1.2 Technical Information (12/96)

=====

Article Created: 16 December 1996

TOPIC -----

This article is the Open Transport 1.1.2 Technical Information file.

DISCUSSION -----

This document contains technical information about Open Transport that may be useful to network managers and administrators. You do not need to read this document in order to use Open Transport.

Contents

=====

Introduction

Files added by the Open Transport installer

Open Transport AppleTalk features

- Static and dynamic AppleTalk address allocation
- Use of parameter RAM

Open Transport TCP/IP features

- DHCP server support
- DHCP address lease support
- Windows NT advanced server support
- BootP support
- Local Hosts file support
- MacTCP "server" addressing support
- MacTCP "dynamic" addressing support
- MacIP support
- PPP connectivity

Memory requirements

Application compatibility guidelines

Performance

Introduction

=====

Open Transport is modern networking and communications system software for the Mac OS. It is based on industry standards and brings a new level of networking connectivity, control, and compatibility to Mac OS computers, while preserving built-in support for easy-to-use networking. Open Transport is supported on system software versions 7.1, 7.1.1, 7.1.2, 7.5.3, 7.5.5 or later. System software version 7.5.3 or later is recommended. No other system software versions are supported.

For more important information about system requirements, compatibility, and known incompatibilities and limitations, read the Open Transport 1.1.2 Read Me document.

Files added by the Open Transport installer

=====

Open Transport installs the AppleTalk and TCP/IP control panels into the Control Panels folder inside the System Folder of your startup disk. The Open Transport Installer also adds the following files to the Extensions folder inside the System Folder:

Shared Library Manager

Shared Library Manager PPC

These extensions implement a shared library mechanism on 68K and PowerPC Mac OS computers, respectively. Both extensions are required on PowerPC-based computers in order to support both emulated and native shared libraries.

OpenTransportLib

Open Transport Library

These shared libraries implement core Open Transport services on PowerPC-based computers. The first library contains the PowerPC implementation and an interface for native PPC applications. The second library contains the built-in Open Transport modules and an interface for emulated 68K applications.

OpenTptAppleTalkLib

Open Tpt AppleTalk Library

These shared libraries implement Open Transport AppleTalk services on PowerPC-based computers. The first library contains the PowerPC implementation and an interface for native PPC applications. The second library contains the built-in Open Transport modules and an interface for emulated 68K applications.

OpenTptInternetLib

Open Tpt Internet Library

These shared libraries implement Open Transport TCP/IP services on PowerPC-based computers. The first library contains the PowerPC implementation and an interface for native PPC applications. The second library contains the built-in Open Transport modules and an interface for emulated 68K applications.

Open Transport 68K Library

This shared library implements core Open Transport services on 68030- and

68040-based computers.

Open Tpt ATalk 68K Library

This shared library implements Open Transport AppleTalk services on 68030- and 68040-based computers.

Open Tpt Inet 68K Library

This shared library implements Open Transport TCP/IP services on 68030- and 68040-based computers.

Open Transport AppleTalk Features

=====

Static and dynamic AppleTalk address allocation

Open Transport AppleTalk supports static assigned (manually administered) protocol addresses as well as the dynamic addressing provided by AppleTalk Address Resolution Protocol (AARP). Static addressing allows AppleTalk nodes to be managed using the protocol address as a unique and stable identifier.

It is important that all nodes on each individual AppleTalk subnet (a given cable segment assigned a unique network number or network number range) be administered consistently—either all with dynamic addressing or all with pre-assigned static addresses. This avoids a potential conflict when a new dynamic node acquires an address assigned to manually-addressed node that is not connected or is off line. Administrators can enforce the addressing policy for a subnet by locking the addressing mode. As a precaution, Open Transport AppleTalk checks for duplicate protocol addresses on the LAN even when static addressing is configured.

Use of parameter RAM

Under classic AppleTalk, AppleTalk's on/off state, the selected network interface, the previous network (protocol) address, and the previous AppleTalk zone name are saved in persistent memory (parameter RAM) for reuse at startup. To ensure backward compatibility, this information is still stored and retrieved on systems using Open Transport AppleTalk. However, the following differences are found with Open Transport:

- At startup, Open Transport reads the current AppleTalk configuration file to determine if AppleTalk should be turned on or off. This value overrides the value saved in parameter RAM. The user is not explicitly notified when this occurs.
- If the network interface specified in the current AppleTalk configuration file is locked and the specified port is not available or cannot be initialized, Open Transport will not automatically switch the port back to LocalTalk. Instead, AppleTalk will remain off. The user sees a dialog box with this information.

Open Transport TCP/IP features

=====

Open Transport brings a workstation-class implementation of TCP/IP protocols to Mac OS. As with MacTCP, Open Transport TCP/IP is a full 32-bit stack. Open Transport TCP/IP adds support for:

- dynamic path MTU discovery, for more efficient network use in heterogeneous network topologies.
- Dynamic Host Configuration Protocol (DHCP), for centralized IP address configuration management. DHCP is an Internet Engineering Task Force (IETF) standards-track protocol.
- IP multicast, for participation as an MBone client for applications written to the native Open Transport API.
- simultaneous TCP connections for applications written to the native Open Transport API are limited only by installed memory and processor power, for increased functionality as an Internet or other TCP/IP network server.
- a new, more robust and standards-compliant domain name resolver (a caching stub DNR).
- support for developer access to raw IP services, as well as TCP and UDP.
- Ethernet Version 2.0 and IEEE 802.3 framing, for better interoperability with a wider range of TCP/IP hosts.
- implicit and explicit domain name search paths, for increased control of domain name resolution.
- use of multiple IP routers with fail-over, for increased robustness in mission-critical applications.
- TCP wildcard source port assignments start at 2048, increasing from that point.

DHCP server support

Apple's implementation conforms to the current versions of the applicable specification documents (RFCs). To date, Open Transport TCP/IP has been tested with the following DHCP server implementations:

- Competitive Automation (URL: <http://www.join.com>)
- FTP Software (URL: <http://www.ftp.com>)
- Hewlett Packard HP-UX (URL: <http://www.hp.com>)
- Microsoft Windows NT Advanced Server (URL: <http://www.microsoft.com>)
- Silicon Graphics (URL: <http://www.sgi.com>)
- Sun Solaris and SunOS (URL: <http://www.sun.com>)
- TGV (URL: <http://www.tgv.com>)

DHCP address lease support

Open Transport TCP/IP supports DHCP address leases. Open Transport TCP/IP automatically attempts to renew any address lease that reaches its renewal interval (by default, the renewal interval is reached when the lease is halfway completed). The renewal interval may be configured to a different value by making changes to the configuring DHCP server. Renewal is attempted regardless of how many times the lease has already been renewed. Lease rebinding is also supported. Should an interface's IP address lease expire, the interface is closed down. Open Transport TCP/IP does not currently support the DHCP Client ID option or the DHCPINFORM message, nor will it currently try to use the remainder of a previous but unexpired lease upon rebooting.

Windows NT advanced server support

With Open Transport 1.1 and later, Mac OS clients are interoperable with the Windows NTAS DHCP server on LAN links. However, Mac OS clients cannot acquire configuration information from an NT DHCP server across a dialup (PPP) link because there is not yet an accepted industry standard for DHCP over dialup. The NT implementation is based on proprietary Microsoft extensions. Mac OS clients cannot acquire configuration information nor register with a Microsoft WINS server. WINS is also dependent on Microsoft extensions to TCP/IP (requiring NetBIOS support).

The Internet Engineering Task Force (IETF) is developing a cross-platform industry standard technology for dynamic registration and look-up of IP names through the Dynamic Service Location working group. Apple has no current plans to implement the WINS extensions. Instead, we are fully committed to implementation of the applicable IETF standards as they emerge.

Macintosh clients running versions of Open Transport prior to 1.1 could experience some interoperability problems due to other significant differences between the Microsoft implementation and that of a typical UNIX-based server.

BootP support

Open Transport 1.1 and later fully supports Bootstrap Protocol (BootP). Versions of Open Transport prior to 1.1 failed to accept a BootP Reply sent to the unicast (subnet broadcast) address, (for example, xxx.xxx.xxx.255. Replies sent to the all-nets broadcast address (for example, 255.255.255.255) were handled properly. Also, earlier versions of Open Transport required that the BootP gateway be zero hops away.

Local Hosts file support

Open Transport TCP/IP supports a Hosts file that may be used to supplement and/or customize the Domain Name Resolver's initial cache of information. The Hosts file is normally stored in the Preferences folder in the active System Folder. When Open Transport TCP/IP is initialized, it reads the Hosts file (if any). As in MacTCP, the supported Hosts file features follow a subset of the Domain Name System Master File Format (RFC 1035).

Open Transport TCP/IP is more stringent regarding the content and format of the Hosts file than was MacTCP, which permitted violation of the FQDN requirement for <domain-name>. For instance, the format:

```
charlie          A          128.1.1.1
```

which was acceptable to the MacTCP DNR, is no longer permitted because of the use of domain search lists in Open Transport/TCP ("charlie" could potentially exist in any or all of the configured domains). To accomplish the same effect, use this format instead:

```
charlie          CNAME      myhost.mydomain.edu
myhost.mydomain.edu  A          128.1.1.1
```

This associates the local alias charlie with the fully qualified domain name myhost.mydomain.edu, and resolves it to the address 128.1.1.1. Use of local aliases is limited to CNAME entries; NS and A entries must use fully qualified domain names.

You can create a Hosts file with any text editor or word processor (the Hosts file must be stored in text format). If you use a Hosts file, keep it as short as possible, and include only entries that will be accessed frequently. This reduces the memory required to cache the DNS information and minimizes the need to maintain and update Hosts files as system information changes.

Open Transport TCP/IP automatically uses a Hosts file stored in the Preferences folder of the active System Folder. If no Hosts file is found in the Preferences folder, Open Transport TCP/IP searches the active System Folder for a Hosts file. You can specify a particular Hosts file to use with a specific configuration. For example, one Hosts file might be set up for a user connecting via Ethernet, and another set up for when that user connects via modem.

For additional information about the Hosts file design of the Open Transport Domain Name Resolver, see the document "Apple Open Transport Reference Q&A." The latest version of the Q&A is in the Open Transport Extras Folder and is available on the Internet at <ftp://seeding.apple.com/ess/public/opentransport/>.

MacTCP "server" addressing support

Open Transport TCP/IP supports both Bootstrap Protocol (BootP) and Reverse Address Resolution Protocol (RARP) configuration methods. MacTCP Server mode addressing was a combination of BootP and RARP. When Server mode was selected, MacTCP used BootP to attempt to acquire an IP address. If that failed, MacTCP tried RARP. Whichever protocol was successful was stored as a preference, and was used first the next time the computer started up. In Open Transport, you must choose BootP or RARP explicitly.

MacTCP "dynamic" addressing

Open Transport does not support MacTCP "dynamic" addressing. MacTCP dynamic mode addressing was based on an Apple-proprietary extension to TCP/IP protocols. It applied the address negotiation and assignment rules used by the AppleTalk protocols to TCP/IP networks, making it very easy to set up a Macintosh-only standalone TCP/IP network. Use of this dynamic addressing method in other scenarios, however, could create additional work for a network administrator.

The Internet community (IETF) has since developed a multivendor standard for the dynamic assignment of IP addresses, known as Dynamic Host Configuration Protocol (DHCP). Open Transport TCP/IP supports the industry standard DHCP.

MacIP support

MacIP is a protocol specification developed for carrying TCP/IP traffic on AppleTalk-only networks, originally LocalTalk networks. MacIP is today frequently used with AppleTalk Remote Access Protocol (ARAP) to provide mobile users access to TCP/IP network services.

Use of MacIP typically requires a gateway, which strips off the AppleTalk encapsulation and places the IP packet on the TCP/IP LAN. When packets are sent back to the MacIP end-node, the gateway replaces the AppleTalk encapsulation. MacIP gateway support is most frequently offered as an integrated service within a multiprotocol router. The gateway (router) attaches to both an AppleTalk and a TCP/IP network.

Open Transport supports MacIP in the TCP/IP control panel. Once selected, TCP/IP data is encapsulated in AppleTalk packets, and is sent through the selected network interface.

PPP connectivity

PPP (Point to Point Protocol) connectivity for Open Transport is currently based on the use of third-party software extensions known as "MDEVs." Early versions of these extensions may not be compatible with Open Transport. For information about MDEV compatibility, see the Open Transport 1.1.2 Read Me document.

Memory requirements

Open Transport provides many new features and capabilities to Mac OS customers and, in general, will require more system memory (RAM) than does classic networking. However, the actual memory requirements of Open Transport vary depending upon the networking services in use at a given time. This is different from classic networking, which allocates memory to networking services and keeps it allocated even after networking services are no longer in use.

Factors contributing to differences in memory requirements include:

- Open Transport provides implementations of networking as both 680x0 and native PowerPC code. PowerPC code is typically larger (but also faster).
- Open Transport provides "mixed-mode" applications support, making it possible for both PowerPC native and 680x0 applications to use native networking on PowerPC-based computers.
- Open Transport includes both the new implementations of networking and the libraries required to provide backward compatibility support for the older AppleTalk and MacTCP programming interfaces.

- Open Transport requires less memory on systems with virtual memory enabled. Classic networking has about the same memory requirements regardless of the VM setting.
- Open Transport is based on the cross-platform standard STREAMs environment, which requires more memory than classic networking.

The difference in memory requirements depend upon the configuration of your computer. Some examples of base memory requirements include:

Begin_Table

Computer System	Virtual Memory	Classic AppleTalk & MacTCP	Open Transport
-----	-----	-----	-----
PowerPC-based	On	350K to 450KB	200KB
PowerPC-based	Off	350K to 450KB	up to 1.2MB
608x0-based	Off	350K to 450KB	700KB to 800KB

End_Table

Application compatibility guidelines

=====

Apple has defined three levels of interoperability with Open Transport. The first, "Open Transport Compatible," is used to describe network applications originally developed for "classic" AppleTalk or MacTCP programming interfaces that now take advantage of Open Transport Compatibility Services. These applications automatically gain the benefits associated with the Open Transport control panels. However, they will not realize a significant performance increase on Power Macintosh systems, nor can they take advantage of Open Transport's transport-independence capabilities.

"Open Transport Ready" applications have adopted the new Open Transport APIs. They are PowerPC native, in addition to running on 680x0-based Macintosh systems. Open Transport-ready applications benefit from the new control panels and may also realize a significant performance boost when running on PowerPC-based computers.

The highest category of interoperability is "Open Transport Enhanced." In addition to adopting the new Open Transport APIs and being Power PC native, these applications can be dynamically configured to support AppleTalk, TCP/IP, or serial communication.

Applications that rely on undocumented APIs or examine private data structures in AppleTalk or MacTCP may not be fully compatible with Open Transport. Updated versions of these software products will be required for full compatibility.

Performance

=====

Open Transport is designed to take advantage of the PowerPC processor. For maximum performance, however, networking applications must also take advantage of the PowerPC processor, and should adopt the new Open Transport programming interfaces.

In general, current Mac OS networking applications are written for the 680x0 processor and use the "classic" (680x0-based) networking programming interfaces. These applications can still be used with Open Transport, and may perform somewhat better. Networking applications that are PowerPC-native but not Open Transport-ready may yield better performance, but still fall short of the maximum potential performance because they make use of Open Transport backward compatibility rather than its full capabilities.

Performance improvements will be greater with protocols that use larger datagram sizes. For example, TCP/IP users will see greater improvements than AppleTalk users, because AppleTalk has a fixed and limited datagram size. On high-speed datalinks such as fast Ethernet, FDDI, and ATM, the performance of the network interface card (NIC) driver code is also a significant factor.

Overall performance also depends on the amount of RAM available. Larger packet sizes and higher throughput place increased demand on the buffering system of Open Transport. If Open Transport becomes low on memory, throughput decreases to accommodate the limitation.

Multiprocessing Software Read Me (12/96)

Article Created: 17 December 1996

TOPIC -----

This article is the Multiprocessing Software ReadMe file.

DISCUSSION -----

Important Information
About the Multiprocessing Software

Contents

- Introduction
- Installing Multiprocessing Software
- Turn off virtual memory and do not install RAM Doubler
- Turn off hard disk sleep
- Important Information About Document Auto-Save

Introduction

This document provides information about the multiprocessing software that is included with your multiprocessor Power Macintosh computer, and how to configure your computer properly to take advantage of multiprocessor performance.

Installing Multiprocessing Software

Your multiprocessor Power Macintosh computer comes with Apple Multiprocessing software already installed, but doing a "clean" installation of system software will remove the multiprocessing software, and may also turn on virtual memory. (See the "Troubleshooting" chapter of your Power Macintosh User's Manual for more information about clean installation of system software.)

After doing a clean installation of system software, be sure to reinstall the multiprocessing software on this disk. Also, follow the instructions in the next section to turn off virtual memory if necessary. Otherwise, your

multiprocessor-compatible software applications will not be able to take advantage of the second PowerPC processor.

To reinstall the multiprocessing software, double-click the Installer icon on the disk, and follow the instructions on the screen.

Turn off virtual memory and do not install RAM Doubler

Turn off virtual memory in the Memory control panel, and do not install Connectix RAM Doubler software. If virtual memory is turned on or RAM Doubler is installed, then your multiprocessor-compatible software applications will not be able to take advantage of the second PowerPC processor.

To turn off virtual memory, open the Memory control panel and in the Virtual Memory section, click the Off button. Then restart your computer. For more detailed information about virtual memory, see the "Memory" topic area in Macintosh Guide, available in the Guide menu.

Turn off hard disk sleep

Make sure that the hard disk sleep interval is set to "Never" in the Energy Saver control panel. Otherwise, software applications designed to work with your multiprocessor Power Macintosh may not work properly.

To set your hard disk sleep interval, do the following:

- 1) Open the Energy Saver control panel.
- 2) If necessary, click Show Details to make the additional options available.
- 3) Drag the top and bottom sliders as shown below.

If you wish, you can set a display sleep interval by dragging the middle slider. Display sleep works properly with multiprocessor-compatible software applications.

Important Information About Document Auto-Save

The Energy Saver control panel contains a feature named "Document Auto-Save." The purpose of this feature is to automatically quit all open applications during an idle or scheduled shutdown, while saving changes to any open documents in each application. Since there are literally thousands of applications available for the Macintosh (with new ones always arriving), we cannot guarantee that Document Auto-Save will be compatible with every application. This is especially true for any application that does not use standard routines to implement the alerts or dialog boxes used to save changes to new or modified documents. When Document Auto-Save is incompatible with an application, it will either not automatically quit, or it will display alerts or dialog boxes that Document Auto-Save does not recognize and therefore does not dismiss.

If you intend to turn Document Auto-Save on, we recommend that you monitor its operation during the first attempted idle or scheduled shutdown and note if any

of your applications are not compatible. You can avoid problems with incompatible applications simply by making sure you leave open no documents that are new or modified before an idle or scheduled shutdown is to occur. Alternatively, you can modify the Document Auto-Save preferences in the Energy Saver control panel so the computer will sleep rather than shut down when unsaved documents are open.

For instructions for using Energy Saver & Document Auto-Save, choose Macintosh Guide from the Guide menu when the Finder is active, and choose the Energy Saving topic area.

Tips

- Using a Microphone
- Using the Pointer Mode Control Panel for the Power Macintosh 7200
- Improving Video Capture
- Software for the GeoPort Telecom Adapter or Express Modem
- Installing QuickTime 2.5 and Open Transport 1.1.1
- Installing Acrobat Reader Software from the System Software CD
- Using Power Macintosh MP-Compatible Application Programs

Troubleshooting

- Printing Problems
- Performance Problems
- Problems with Sound
- Problems with Monitors
- Networking and File Sharing Problems
- Problems Using a RAM Disk
- Problems with Programs Freezing or Quitting Unexpectedly
- Problems Sending a Fax
- Problems Using Infrared Features

Tips
=====

Using a Microphone

For best results when using a microphone with your computer, be sure to use the Apple PlainTalk Microphone. To use speech-recognition technology with your computer, you must use the Apple PlainTalk Microphone (or a compatible powered microphone).

Some models come with the PlainTalk microphone. You can obtain the microphone from an Apple-authorized dealer. (You can't use the round microphone supplied with some other computers.)

The Apple AudioVision 14 Display and AppleVision 1710AV Display have the Apple PlainTalk Microphone built in.

Using the Pointer Mode Control Panel for the Power Macintosh 7200

The Pointer Mode control panel lets you control the way the mouse pointer works with certain types of graphics software and screen capture programs. For more information, read the document titled "Pointer Mode Read Me" in the Pointer Mode folder (inside the Apple Extras or CD Extras folder, whichever is available on your computer or system software CD).

Improving Video Capture

For best video capture performance, you need at least 16 megabytes (MB) of random-access memory (RAM) installed in your computer.

You can increase the speed of video capture by taking one or more of the following actions:

- Turn off virtual memory.
- Set the screen bit depth to millions of colors.
- Reduce the size of the capture window (320x240 and smaller are the best sizes).
- Make sure that the application program you use for capturing video has enough extra memory allocated for one second of video at the size and bit depth that you are using to record. For example, to record 30fps at 320x240 in millions of colors requires at least 4500K (4.5 MB) free in the application partition. About This Macintosh (in the Apple menu) lets you to estimate memory usage.
- Do not allocate all of the available memory to the capture application. When your capture application is running, you should have an unused block size of at least 500K in About This Macintosh.
- Do not run programs other than the capture application while capturing video. If possible, turn off AppleTalk, the menu bar clock, and all unnecessary extensions. Do not turn off QuickTime. (Use the Extensions Manager control panel to turn off these extensions; then restart your computer.)
- Make sure that your hard disk has enough free space to record. If you notice a decline in performance, use a disk optimizer to improve your disk's efficiency.

When working with applications that support adjusting video and sound settings, the following settings allow the highest video capture performance:

- Use the Component Video video compressor. Do not use post-compression.
- Set sound input sampling to 16 bits, stereo, and 44.1KHz. Do not use a sound compressor.

Software for the GeoPort Telecom Adapter and Express Modem

Apple Telecom software is available on the CD that came with your computer. Apple Telecom is the software for the GeoPort Telecom Adapter for PowerPC-based computers and the Express Modem for PowerBook computers.

In the U.S. and Canada, MegaPhone is also available with the Apple Telecom software. It is a screen-based telephone application that supports the telephone capabilities of the Apple Telecom 2.x software using the GeoPort Telecom Adapter, including dialing from a graphical keypad, copying and pasting telephone numbers, and dragging and dropping business card information.

If you are using a GeoPort Telecom Adapter with Apple Telecom software on a Power Macintosh 7200, 7600, 8500, or 9500, be sure to disable LocalTalk. To do this, disconnect any devices attached to the printer port (serial devices can remain attached).

In the U.S., Canada, and Japan, Apple Telecom is available as part of the GeoPort Telecom Adapter Kit, which can be purchased separately. The kit includes MegaPhone as well as SITcomm SE/GTA (a terminal emulation program). Apple Telecom, along with MegaPhone (but without SITcomm) is also available as a free upgrade on CompuServe, America Online, and all Apple Internet sites.

Installing QuickTime 2.5 and Open Transport 1.1.1

Updated Open Transport 1.1.1 and QuickTime 2.5 software are included in the CD Extras folder on the system software CD-ROM disc that came with your computer. You can install these updates if you wish.

Open Transport 1.1.1 is an enhanced version of the networking and communications software for Macintosh computers. QuickTime 2.5 is the latest version of Apple's digital video software, and is particularly useful for content creators using software applications such as Adobe Premiere. For more information about Open Transport and QuickTime, see their folders in the CD Extras folder on the CD.

Installing Acrobat Reader Software from the System Software CD

To install Acrobat Reader software from the system software CD onto your hard disk, make sure that the system software CD that came with your computer is not the startup disk. Then locate the Acrobat Reader folder on the CD and follow the installation instructions.

Note: To make sure that the system software CD is not the startup disk, shut down your computer. Then start up the computer while pressing the eject button on the CD-ROM drive (the disc is ejected). After the computer restarts, reinsert the CD and install the Acrobat Reader software.

Using Power Macintosh MP-Compatible Application Programs

If you're using a Power Macintosh 9500/180MP multiprocessing model, your computer contains two PowerPC processors for faster performance. Though you can use any Macintosh program with a Power Macintosh MP computer, you will get the best performance when you use MP-compatible programs that are designed to take advantage of the second PowerPC processor. These programs can provide significant performance improvements in processor-intensive tasks such as video-editing, 3D modeling, and scientific/technical applications.

To find out if an application program performs better on a Power Macintosh MP model, check the system requirements for the program. As of 11/6/96, the following software applications are known to be MP-compatible:

- Adobe After Effects 3.1
- Adobe Photoshop 3.0.5
- Adobe Premiere 4.2.1 with Movie Capture Module 4.2.2
- Deneba Canvas 5.0
- Kodak Color Processor
- Strata Studio Pro 1.7.5+

An additional listing of MP-compatible programs is available at the Daystar Digital World Wide Web site at
<<http://www.daystar.com/Superfast.Aps/Aps.html>>.

If you don't notice a performance increase when using an MP-compatible program, make sure virtual memory is turned off in the Memory control panel.

The following sections list some usage tips and known compatibility problems with MP-compatible application programs on the Power Macintosh 9500/180MP. If you experience other software issues, contact the program's publisher for assistance.

Strata Studio Pro 1.7.5+

- Make sure sufficient random-access memory (RAM) is available to do a render.
- Make sure to manually save your document after a render is complete. If you quit the program without saving, an alert box will not appear to warn you that there are unsaved changes, and your changes will be lost.
- After a render is complete, choosing "Show Balloons" from the Guide (?) menu will cause the program to unexpectedly quit. (This also can occur in Strata Vision 3D version 4.0.)
- You cannot print a Studio Pro document by dropping the document icon onto a Desktop Printer icon. To print a Studio Pro document, start the Studio Pro program and use the Print command in the program.
- When you save a Studio Pro document, its name does not immediately appear in the "Recent Documents" submenu in the Apple menu.

Premiere 4.2.1

- Use the latest 1.0.0 Premiere MP plug-in from Daystar. There are incompatibilities between the 1.0.0d0 version and the Media 100.
- Using the Copy to Construction commands in the Edit menu will cause the

program to unexpectedly quit.

Troubleshooting

=====

IMPORTANT: For more troubleshooting information on the problems described below and other topics, refer to Macintosh Guide (available in the Guide menu when the Finder is active) and the manuals that came with your computer.

Printing Problems

Your system freezes or experiences other problems when printing on a LaserWriter Select 300 or 310 printer. This problem can occur when you attempt to print but your printer is not connected to your computer. Trying to cancel printing in the Print Monitor does not solve the problem and may produce a flashing error message or cause your computer's performance to slow down.

Connect the printer to the computer. If you see a message with a Continue button, click Continue. Normal printing is resumed.

You have trouble printing on a StyleWriter or StyleWriter II printer. If you use a StyleWriter or StyleWriter II printer with your computer, use the StyleWriter 1200 printer driver that came installed on your computer. Do not install your older StyleWriter driver; it is not compatible with PowerPC-based computers.

You have trouble printing with Apple PhotoFlash. If you have problems printing images with the PhotoFlash software, make sure that you choose a printer in the Chooser before you choose the Print command from the File menu.

You can't use the "Print Later" option with a non-networked printer. If you have the Assistant Toolbox extension installed on your computer and you want to use the "Print Later" option when printing on a non-networked printer, you must turn off the Assistant Toolbox extension.

Use the Extensions Manager control panel to turn off the Assistant Toolbox extension:

- 1) Open the Apple menu and choose Control Panels.
- 2) Open the Extensions Manager control panel.
- 3) In the list of extensions, click next to the Assistant Toolbox extension to remove the checkmark.
- 4) Restart your computer.

You see a low-memory warning when you print Stickies on a StyleWriter, StyleWriter II, or StyleWriter 1200 printer. This problem can occur when the amount of memory Stickies uses is set below 150K. Try increasing the amount of memory available to Stickies. For instructions on changing the memory a program uses, refer to Macintosh Guide, available from the Guide menu when the Finder is active. To locate the Stickies application program so you can increase its memory, open the System Folder, then look in the Apple Menu Items folder (inside the System Folder).

Performance Problems

You see a message that not enough memory is available. This problem can occur for several reasons. For detailed tips on memory-related problems, refer to the troubleshooting information in the manuals that came with your computer, and the information on memory in Macintosh Guide (available in the Guide menu when the Finder is active).

If this problem occurs after you open the Extensions folder in the System Folder and scroll through a long list of extensions, restarting your computer will restore normal performance.

Problems with Sound

You can't hear alert sounds, QuickTime movie sound, or text-to-speech sound. You can't record sound using SimpleSound or other sound recording software. If you experience these problems after installing Apple Telecom software, you need to remove the Audio TuneUp system software extension in your System Folder. To remove the extension:

- 1) Open the System Folder on your hard disk.
- 2) Open the Extensions folder (inside the System Folder).
- 3) Locate the Audio TuneUp extension and drag it out of the Extensions folder and out of the System Folder. You can save a copy of Audio TuneUp in another folder or on a floppy disk, but be sure that no copy remains in the Extensions folder or the System Folder. Removing Audio TuneUp does not affect the functionality of your computer.
- 4) Restart your computer.

When you play back sound you've recorded, you notice clicks, pops, or skips. This problem can occur if you have virtual memory turned on while you're recording sound. Turn off virtual memory before recording. For instructions on turning off virtual memory, refer to Macintosh Guide, available from the Guide menu when the Finder is active.

Adjusting the volume slider in Apple Video Player and other sound applications does not affect the volume, or turns the volume all the way up or all the way down (no in-between settings). This problem occurs on some newer models that handle sound differently from some application programs. You can use the system sound settings to adjust the volume. Follow these steps:

- 1) Open the Apple menu and choose Control Panels.
- 2) Open the Monitors & Sound control panel.
- 3) Click the Sound button.
- 4) Use the volume or level slider (whichever is available) to adjust the sound volume.

Your program requires the Sound control panel to set sound options. Some application programs that use sound require the Sound control panel, an older control panel that has been replaced on your computer by the Monitors & Sound control panel.

If your application requires the Sound control panel, you can install it from

the Apple Extras folder. For instructions, read the file titled "Installing the Sound Control Panel" in the Sound folder, which is inside the Apple Extras or CD Extras folder. (The Apple Extras folder is on the computer's hard disk, and the CD Extras folder is on the system software CD that came with your computer.)

Note: You can also install the Sound control panel by doing a custom installation of system software. For instructions, refer to the information on doing a custom installation in the Troubleshooting chapter of the manual that came with your computer. When the Custom Install dialog box appears, click "Sound control panel" in the list, then click Install.

HyperCard version 2.3.3 or earlier does not record sound properly on your computer. Other sound recording application programs, including SimpleSound and the Sound control panel, can record sounds that you can import and play within HyperCard 2.3.

Problems with Monitors

There is no image when you try to use a TV as a monitor with a Power Macintosh 8500. You can use a TV or other composite monitor with a Power Macintosh 8500 equipped with 2 MB of video RAM (VRAM), but the VRAM must be installed in the two DIMM slots labeled "VRAM Bank 1." For more information about installing memory DIMMs, refer to the Technical Information booklet that came with your computer.

Networking and File Sharing Problems

IMPORTANT: For information about Open Transport, see the information on networking in Macintosh Guide and in the manual that came with your computer. Additional information about Open Transport is on your hard disk in a separate folder.

AppleShare displays incorrect information for large drives. If you use File Sharing to share a disk larger than 2 gigabytes (GB), some older computers connected to your computer may display an incorrect size for the disk in the Get Info box. (Get Info reports the disk to be 2 GB in size, even if it is larger.)

Since these older computers do not support the larger drives, they also cannot report correct information about the drives. (Computers with System 7.5 display correct information.)

You can't reconnect to a server. If you unexpectedly lose a connection to a server on which you have items in use, and then choose the server from the Recent Servers item in the Apple menu, you get a message that the disk could not be opened because you do not have enough access privileges or because the server can't be found on the network. Before you can reconnect to the server, you must close any open files. If you need to save work in a file, use Save As to save it on a different disk.

You see zones and/or servers listed in the Chooser, but the network cable is not connected to the computer. This problem can occur if you disconnect the network cable from the back of your computer while the Chooser is open. Be sure to shut down your computer before disconnecting a network cable.

You have problems using AppleShare Server Software version 4.1 or 4.2. AppleShare server software versions 4.1 and 4.2 are not intended for use with PCI-based computers, including Power Macintosh 7200, 7600, 8500, and 9500 computers. If you attempt to use AppleShare server software version 4.1 or 4.2 with these models, you may experience problems.

Problems Using a RAM disk

You see a message that your RAM disk is unreadable. Under some circumstances you may see the following message after setting up a RAM disk:

"This disk is unreadable by this Macintosh. Do you want to initialize the disk?"
(Important: This message applies to the RAM disk, not to your hard disk, which will not be initialized.)

Decrease the size of the RAM disk. If you see the message again, decrease the size again. Continue to decrease in small amounts until the message no longer appears.

Problems with Programs Freezing or Quitting Unexpectedly

MoviePlayer quits unexpectedly. Using MoviePlayer 2.1, you can play a movie at double (2X) size. You cannot present a movie (that is, play the movie on a second monitor) at double size. Presenting a movie at 2X size results in the Movie Player quitting without warning.

Wiggleworks freezes, quits unexpectedly, or won't produce sound. Wiggleworks 1.0 requires special software, Macintalk Pro, to produce sound. The version of Macintalk Pro that comes with Wiggleworks is not compatible with your computer. After installing Wiggleworks, you need to drag a newer version of Macintalk Pro (version 1.4 or later) to the Extensions folder (inside your System Folder).

There are two ways to obtain Macintalk Pro version 1.4:

- Install PlainTalk from the Apple Extras or CD Extras folder. (The Apple Extras folder is on the computer's hard disk, and the CD Extras folder is on the system software CD that came with your computer.) PlainTalk includes Macintalk Pro version 1.4, which is placed in the Extensions folder when you install PlainTalk.
- Install Macintalk Pro from Apple Computer's America Online or Internet sites. Refer to the manual that came with your computer for information about connecting to Apple's online sites.

If you are unable to obtain Macintalk Pro version 1.4, contact Apple for assistance.

Note: Your computer comes with Macintalk 3. Wiggleworks 1.0 does not work with Macintalk 3. To hear sound with Wiggleworks you must have Macintalk Pro version 1.4 in your Extensions folder, but it is not necessary to remove Macintalk 3.

Maple V quits unexpectedly when you change your monitor resolution. This can

occur if you use the Control Strip to change the monitor resolution while the Maple V program is active. Use the Monitors & Sound control panel instead of the Control Strip to change screen resolution. For instructions on using the Monitors & Sound control panel, refer to Macintosh Guide (available in the Guide menu when the Finder is active).

When you try to install Adobe Premiere Deluxe, the mouse freezes. This can occur if you have virtual memory turned on and AppleTalk active when you try to install Adobe Premiere Deluxe. Turn off virtual memory and make AppleTalk inactive before installing. For instructions, refer to Macintosh Guide, available from the Guide menu when the Finder is active.

This problem does not occur if you select Adobe Premiere 4.2 installation instead of Adobe Premiere Deluxe.

Problems Sending a Fax

You have trouble sending a fax. If you use PowerTalk Direct Dialup Mail and have trouble sending a fax, it may be because both Direct Dialup and STF PowerFax PE are set to auto-answer. To turn off STF auto-answer, open the STF Setup window and set 'n' to "never" (in the "Answer on 'n' rings" section).

Problems Using Infrared Features

Farallon AirPath v1.0 and Apple IR File Exchange don't work on your computer. Also, Farallon AirDock and other infrared devices are not detected through a serial port that has been selected in the AppleTalk control panel, and the string "(IR)" is not appended to the port name. Infrared (IR) features are not fully supported on desktop computers running system software version 7.2.3. An AirDock connected to a selected AppleTalk serial port will, in most cases, operate normally (though forwarding features are disabled). This lets you connect to the desktop system using Personal File Sharing. These problems do not occur on PowerBook computers, and will be corrected on desktop computers in a future update.

PowerFrax Read Me (12/96)

=====

Article Created: 17 December 1996

TOPIC -----

This article is the PowerFrax Read Me file from DayStar Digital dated 7/22/96.

DISCUSSION -----

PowerFrax
=====

PowerFrax is a benchmarking application that generates fractals from the classic Mandelbrot set. The fractal patterns that are shown on the screen are the result of intense floating point calculations performed for each pixel in the image. The length of time required to perform these calculations is a good measure of the capabilities of the processor or processors performing them. PowerFrax has a built-in timer that allows comparisons to be easily made.

Using PowerFrax
=====

PowerFrax has a number of features that make exploring fractals easy and fun.

When you first launch PowerFrax it will open a new window and display the Mandelbrot set. To explore the fractal select the Crop tool in the Info window.

Now click and drag out a selection within the fractal to create a new fractal zoomed in on the area selected. This is the principle way to explore the fractal. To make a square selection hold down the shift key. The area selected is magnified into a new window. Clicking and dragging will work in any fractal window.

The PowerFrax Tools
=====

This section describes the function of the PowerFrax tools.

Drag And Drop

This tool will let you drag a copy of the current window to any application that will accept a dropped picture, e.g. the Scrapbook or the Finder.

Crop

As described above, this tool will let you magnify a selection from an existing fractal into a new window.

Magnify

This tool will let you magnify a fractal. Holding the option key down will let you reduce the fractal.

Shift

This tool will let you shift the fractal. Only the exposed areas will be recalculated. The generation time is not applicable and will not be displayed for a shifted fractal.

Sample

This tool is only available for Julia Set fractals. It is described below.

The PowerFrax Menus

=====

This section describes the options available in the PowerFrax menus.

The File Menu

New - Creates a new Mandelbrot set or one of a number of different types of documents if plug-ins are installed.

Open - Opens a previously saved fractal.

Cycle - All previously saved fractals in the selected folder will be played back repeatedly until 'Stop Cycling' is selected from the File menu.

Close - Closes the current fractal. Hold down the option key to close all the fractals.

Save - Saves the current fractal. Note that PowerFrax does not prompt the user to save changed fractals so be sure to save fractals that you like before closing them or quitting PowerFrax.

Save As - Same as save except that the user will be prompted to name the fractal.

Page Setup - Sets up printing parameters using the standard Page Setup dialog.

Print - Prints the current fractal.

Quit - Quits PowerFrax.

The Edit Menu

Copy - Copies the current fractal to the clipboard.

Default Fractal - Changes the fractal that will be generated when 'New' is selected. This option can also be used to restore the original default fractal.

The Control Menu

Restart - Restarts the current fractal from the beginning.

Repeat - Restarts the current fractal from the beginning. Each time it finishes it will be restarted again after a one second delay.

Exact Colors - Uses the precise color set associated with the fractal. This option is not needed and is not available when the monitor is in millions of color mode. When this option is used, colors in windows other than the current fractal window may not appear correctly. Monitors with at least 256 colors capability are required for this option to work well.

Animate Colors - Centers the current fractal on the monitor, grays out the rest of the screen then cycles through all the available colors in the color set associated with the fractal. Use the command key to reverse the direction of the animation. The option key freezes the animation temporarily. The shift key will slow the animation down. Click the mouse or push any other key to end the animation. Note that on multiple monitor systems the fractal will not be centered.

The Window Menu

Hide Info - Hides the Info window.

Window Name - Selects the named window.

The Multiprocessing Menu

Use 'n' Processors - Selects the number of processors to be used to regenerate all open fractals and to generate all subsequent fractals. This menu is only available on multiprocessing systems.

If you type command-'d', the contents of the multiprocessing menu will change. It will provide an option to specify the number of tasks to generate fractals with. The number of tasks that can be created is restricted to 100. Typing command-'d' again will restore the menu to its original state.

PowerFrax Plug-ins =====

PowerFrax supports plug-ins that can generate documents with content other than the Mandelbrot set. The available plug-ins are Julia Sets and 3D Projection. They are described after the Mandelbrot section below. Plug-ins appear in a hierarchical New menu when they are installed.

Mandelbrot =====

The Mandelbrot set is named after Benoit Mandelbrot, a mathematician who did considerable research into fractal systems. It is based on the iterative application of the function $f(z) = z*z + c$, where z is the result of the previous application and c is a constant point in the complex plane.

To generate a fractal the function $f(z)$ is applied iteratively for each pixel in the image. For each pixel the initial value of z is set to 0 and the value of c is set to the pixel's corresponding point in the complex plane. The function $f(z)$ is applied repeatedly until the magnitude of $f(z)$ exceeds the escape radius or until the number of iterations equals 255. The number of iterations performed determines the color of the pixel.

When a Mandelbrot window is active the Info window appears. The Info window's fields are described below:

- The PowerFrax Info window describes the current fractal. White text fields in the Info window can be edited.
- The Center fields are the center of the current fractal in the complex plane.
- The Step field is the degree of separation of each pixel from its immediate neighbors in the complex plane.
- The Escape Radius field is used to determine when to stop performing iterations.
- The Size fields are the pixel dimensions of the fractal. Editing these two fields is the only way to make the fractal bigger or smaller.
- The Colors menu allows the user to recolor the fractal with any one of a variety of different color sets.
- The Generation Time display shows how long it took to calculate the current fractal. Only the time required to perform the calculations is measured -nothing else.
- The Cursor display shows the position in the complex plane of the pixel under the cursor. If the cursor is not over a fractal then this display will be blank.

Julia Sets =====

There is one Julia set for every point in the Mandelbrot set. The Info window content for a Julia Set is very similar to that for a Mandelbrot set.

There are two additional fields defining the point λ in the Mandelbrot set to which the Julia set corresponds.

There is also a sample tool which will allow λ to be set quickly by clicking on a point in any open Mandelbrot window. The sample tool may be activated at any time by holding down the option key. Try holding the mouse button down and moving the sample tool around inside a Mandelbrot window. The results can be very impressive on a fast machine.

3D Projection =====

This plug-in does not generate a fractal. Instead, it creates a three-dimensional projection of an existing fractal. This plug-in will not be available unless QuickDraw 3D is installed.

The Info window for 3D projections is significantly different from the other two types of plug-ins:

- The Projection field states which fractal the projection was derived from. Note that the fractal from which the projection was derived does not have to be left open.
- The Tessalation field defines how many pixels in the corresponding base fractal are traversed before a new vertex in the projection is defined. The smaller this number the more polygons there will be in the projection.
- Maximum Height defines how 'tall' the projection will be. Making this number negative will turn the projection into valleys instead of mountains.
- Rotation Speed defines the angle in degrees between each subsequent frame displayed in a 3D projection window. Setting this number to 0 will make the projection stationary.
- Polygon Count states how many polygons are in the 3D projection.
- Frame Rate states how many frames per second are being displayed.
- The Size fields are the pixel dimensions of the projection document.
- The Drag And Drop tool is the only tool available for 3D projections.

The 3D Projection plug-in also installs the 3D Projection Menu which contains the following options:

Wire Frame - Renders the projection as a wire frame.

Vertex Shading - Renders the projection using vertex interpolation.

Power Macintosh 6400: Why is Modem Port Covered? (12/96)

Revised: 12/17/96
Security: Everyone

Power Macintosh 6400: Why is Modem Port Covered? (12/96)

=====

Article Created: 17 December 1996

TOPIC -----

I have a Power Macintosh 6400/200 computer, and I want to attach an external modem to it. However, the modem port is covered. Why is this port covered? How can I use a modem with this computer?

DISCUSSION -----

Keep in mind that there are two different versions of an Apple "Macintosh 6400" computer: a Macintosh Performa 6400/200 and a Power Macintosh 6400/200. These two computers differ in the bundled hardware and software configurations.

The Macintosh Performa 6400/200 has the modem port covered because it has an internal modem installed in the communications slot. When an internal modem is installed, the external modem port is not functional so Apple provides a port cover.

However, the Power Macintosh 6400/200 does NOT have an internal modem installed. Instead, this configuration has an Ethernet card installed in the communications slot. Having an Ethernet card installed, does NOT disable the modem port. So, if you have a Power Macintosh 6400/200, the modem port is still functional.

The confusion arises because some Power Macintosh 6400/200 computers have inadvertently shipped with the modem port covered. In these cases, if you remove the port cover, you can use the external modem port.

Compatibility Problems

=====

Japanese and Chinese Language Kits

To use the Japanese Language Kit with your computer, you must install version 1.2 or later. In the United States, you can obtain an upgrade by calling Claris at 1-800-293-6617.

To use the Chinese Language Kit with your computer, make sure you use version 1.1.1 or later. To install the Chinese Language Kit version 1.1.1, follow these three steps:

- 1) Install the WorldScript Updater 1.0.
- 2) Install the Chinese Language Kit version 1.0 or 1.1.
- 3) Install the Chinese Language Kit Updater to update your software to version 1.1.1.

IMPORTANT: Be sure to follow the steps in the order shown.

QuarkXPress

To use QuarkXPress with System 7.5.3 or later on a PowerPC-based computer, you must upgrade to QuarkXPress version 3.3.2.

Microsoft Office

If you are using Microsoft Office 4.2.1, you need the "Office 4.2x Update For Power Mac" version 1.0.1 extension, and the "Microsoft Office Manager" version 4.2.1b control panel. These can be found on the Internet. Download the MC1164.HQX and MOMPATCH.HQX "patch" (update) files from Microsoft. The patches are available on the Internet at:

<ftp://ftp.microsoft.com/softlib/mslfiles>

Monochrome Monitor

The Apple 12-inch monochrome monitor (M1050) cannot be used with the Power Macintosh 7200, 7600, 8500, 9500, or future models.

Important Information About Document Auto-Save

=====

The Energy Saver control panel contains a feature named "Document Auto-Save." The purpose of this feature is to automatically quit all open applications during an idle or scheduled shutdown, while saving changes to any open documents in each application. Since there are literally thousands of applications available for the Macintosh (with new ones always arriving), we cannot guarantee that Document Auto-Save will be compatible with every application. This is especially true for any application that does not use standard routines to implement the alerts or dialog boxes used to save changes to new or modified documents. When an application is incompatible with Document Auto-Save, it will either not automatically quit, or it displays alerts or dialog boxes which Document Auto-Save does not recognize and therefore does not dismiss.

If you intend to turn Document Auto-Save on, we recommend that you monitor its operation during the first attempted idle or scheduled shutdown and note if any of your applications are not compatible. You can avoid problems with incompatible applications simply by making sure you leave no documents open that are new or modified before an idle or scheduled shutdown is to occur. Alternatively, you can modify the Document Auto-Save preferences in the Energy Saver control panel to sleep instead of shutting down when unsaved documents are open.

For instructions for using Energy Saver & Document Auto-Save, choose Macintosh Guide from the Guide (question mark) menu, and choose the Energy Saving topic area.

Other Document-Saving Products

There are conflicts when non-Apple document-saving control panels or extensions are used in conjunction with Energy Saver's Document Auto-Save. Examples of such products are NowSave and SuperBoomerang. For best results, use the document-saving features of only one control panel or extension.

Self-Dismissing Dialogs

Under some rare conditions, the Energy Saver control panel may continuously dismiss dialog boxes if the Document Auto-Save feature unexpectedly fails during an idle or scheduled shutdown. (Whenever a dialog box appears, it is dismissed as if you have pressed the Return key.) To return things to normal, simply click the mouse button or press the space bar.

Important Information About Macintosh PC Exchange

=====

Apple File Exchange and Macintosh PC Exchange

The Apple File Exchange software is not compatible with your Macintosh model or with Macintosh PC Exchange. Version 2.0.5 of PC Exchange contains an easier method for accessing DOS and Apple II ProDOS disks on a MacOS-based computer.

AutoDoubler

To use AutoDoubler with Macintosh PC Exchange, you must first open the AutoDoubler control panel and turn off the "Show DD on Compressed Files" option from the DD menu.

Compressed PC Disks and Files

Macintosh PC Exchange does not work with DOS-format floppy disks or SCSI hard disks that have been compressed using Stacker or other DOS or Windows disk-compression utilities. Before transferring compressed DOS files to a MacOS-based computer, you must decompress the files and save them to a noncompressed DOS-format floppy disk.

DMF Format PC Disks

Microsoft provides some PC software on floppy disks that use a formatting scheme called DMF. PC Exchange version 2.0.5 can't read DMF-formatted floppy disks. Standard DOS-format floppy disks work correctly with PC Exchange 2.0.5.

Working With Disks Containing Multiple Partitions

If a SCSI hard disk or removable media cartridge has been formatted to contain multiple partitions, you can use PC Exchange to mount the MacOS-, DOS-, or ProDOS-format partitions as individual volumes on the Macintosh desktop. If the disk contains both MacOS- and DOS-format partitions, PC Exchange will recognize only the MacOS partition. In addition, PC Exchange will recognize ProDOS-format partitions only on SCSI hard disks that are less than 32 megabytes.

You can use PC Exchange to erase existing individual partitions on a SCSI hard disk or removable media cartridge if they have the same format. However, you cannot use PC Exchange to reformat and resize individual partitions contained on the disk. Nor can you format a MacOS-format hard disk or removable media cartridge as a DOS-format disk. To resize or reformat multiple MacOS, DOS, or ProDOS partitions, you need to use third-party software designed for partitioning hard disks and removable media cartridges.

Working with DOS-Format SCSI Removable Media Devices

In order for PC Exchange to recognize any SCSI removable media device, you must turn on the device and eject any cartridges before you turn on your computer.

Do not install the device driver software that came with your removable media device. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your computer. PC Exchange will install its own device driver for that SCSI device.

The Eject Disk command is unavailable when you are working with removable media devices. To unmount and eject a removable media cartridge, drag the device's icon to the Trash. Once the device has spun down and the red light goes out, you can manually eject the cartridge from the drive. To access a removable media cartridge that has been ejected, simply reinsert the cartridge in the drive.

When initializing and formatting Bernoulli and SyQuest cartridges on a DOS or DOS-compatible computer, use the disk setup and partitioning software that came with the SCSI controller card installed in your PC or that came with your Bernoulli or SyQuest device. (Do not use the MS-DOS FDISK command.) Also, use the MS-DOS FORMAT command to format a newly initialized removable media cartridge on a DOS or DOS-compatible personal computer (PC) before you copy DOS files onto it.

When you initialize a removable media cartridge on a DOS or DOS-compatible PC, you must fully partition, initialize, and erase the cartridge using the software that came with your SCSI controller card or removable media drive. If you do not, PC Exchange may not recognize the new DOS-format partitions on that cartridge.

Working with DOS-Format SCSI Hard Disk Drives

In order for Macintosh PC Exchange to recognize a SCSI hard disk drive, you must turn on the drive before you turn on your computer.

Do not install the device driver software that came with your removable media device. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your computer. PC Exchange will install its own device driver for that SCSI device.

When initializing and formatting an external SCSI hard disk connected to a DOS or DOS-compatible PC, use the MS-DOS FDISK command or the disk setup and partitioning software that came with the SCSI controller card installed in your PC. In addition, you should use the MS-DOS FORMAT command to format and erase the disk before you copy DOS files to a new SCSI hard disk connected to a PC.

Tips and Problems

- A "Sad Mac" icon may appear on your screen at startup if a removable media cartridge has been left in the drive. To keep this problem from occurring, manually eject removable media cartridges from their drives before you turn on your computer.
- Macintosh PC Exchange cannot recognize SCSI hard disks, removable media devices, or drive container files that contain more than one gigabyte of disk space.

Launcher: Category Folders & Bullet "•" Character (12/96)

=====

Article Created: 17 December 1996

TOPIC -----

When I create category folders, whose names start with the "•" bullet character in the Launcher Items folder, the Launcher does not display a new category button. What's am I doing wrong?

DISCUSSION -----

There is a bug in the Launcher previous to version 2.8. System 7.5 Update 2.0 includes Launcher 2.8, which fixes this issue. Users are encouraged to install System 7.5 Update 2.0 to fix this bug along with other fixes addressed in this update.

System 7.5 users may update the Launcher only by acquiring disks one and three of the System 7.5 Update 2.0 disk set and performing a custom install of the Launcher control panel.

Other workaround solution

This issue shows up in environments where creation of folders is very frequent. Eventually, the directory ID, known as dirID (an unseen folder counter in the file system) becomes too large for the Launcher to process correctly. With this understanding, the following solution could also be adopted.

Locate a folder on the hard drive that has been around for while and would therefore have low dirID number. Using a temporary folder -- the contents of the old folder and the Launcher's failing bullet-named category folder can be swapped, the folder names interchanged, and the folder locations reversed. The old folder with the lower dirID should be processed correctly as a Launcher category folder.

Performa 6360 & 6400: No QuickDraw GX Installer? (12/96)

Revised: 12/17/96
Security: Everyone

Performa 6360 & 6400: No QuickDraw GX Installer? (12/96)

=====

Article Created: 17 December 1996

TOPIC -----

I have both a Macintosh Performa 6360 and 6400 computer. I cannot find the QuickDraw GX installer on either my hard disk or my Performa CD-ROM disc. Was I supposed to get it? If not, why was it not included on the CD-ROM disc?

DISCUSSION -----

Performa 6400 w/Internal Global Village Modem

QuickDraw GX installer is only included with the Macintosh Performa 6400 computers which come with the internal Global Village communication slot card modem. QuickDraw GX can be found on the Macintosh Performa 6400 CD-ROM disc by following this path:

Hard Disk Files

 Apple Extras Files

 System Software Extras

 QuickDraw GX

Performa 6360, 6400 & 6400 (Video Editing) w/Internal Geoport

The Macintosh Performa 6360, 6400 and 6400 Video Editing Edition computers do not include QuickDraw GX in the System Software Extras folder. All of these computers currently ship with internal Geoport communication slot modem, instead of the Global Village communication slot card modem.

These computers also ship with Adobe Acrobat 2.1 preinstalled. If you install QuickDraw GX over a System Folder that already has Adobe Acrobat 2.1 installed, you may receive an error message that says "substitution fonts for Acrobat or ATM may be damaged or missing...".

Where to Get QuickDraw GX

If you did not receive QuickDraw GX with your Macintosh Performa computer, but you would like to install it, you can download it from all Apple Software Update online sites.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Once you get online in the Apple Software Updates section, the path on most services is as follows:

Apple Software Updates
 US
 Macintosh
 System
 QuickDraw GX

AppleFax Cover Page and the To: Field (12/96)

Revised: 12/18/96
Security: Everyone

AppleFax Cover Page and the "To:" Field (12/96)

=====

Article Created: 18 December 1996

TOPIC -----

When faxing with a Cover Page with AppleFax, some information in the "To:" field is truncated, omitted, or out of logical order.

- The last name is omitted
- There is no line break after the Address Field
- The Zip Code appears before the city
- The State doesn't appear at all

What is wrong?

DISCUSSION -----

You have found a bug in the AppleFax software, some but not necessarily all of the issues listed may occur. It has been reported to engineering, however, there is no known date when this might be fixed.

AIX & Journaled File System: Logical Volume Limitation (12/96)

Revised: 12/18/96
Security: Everyone

AIX & Journaled File System: Logical Volume Limitation (12/96)

Article Created: 18 December 1996

TOPIC -----

This article provides an understanding of journaled file system (JFS) size limitations.

DISCUSSION -----

The maximum size for a JFS is defined when the file system is created. When you create a JFS, there are two significant issues to consider, maximum journaled file system size and journaled file system log size.

Maximum Journaled File System Size

The maximum JFS size is a function of the following three variables, which are set when the file system is created:

- Logical partition size of the volume group
- Fragment size
- Number of i-nodes

The Logical Volume Manager (LVM) limits a volume group to 32 physical volumes and restricts a physical volume to 1016 logical partitions. This means that the maximum file system size as a function of volume group geometry is as follows:

$$32 \times 1016 \times \text{PartitionSize}$$

The fragment size limits the JFS size due to addressability constraints. Each fragment within a file system must be addressable by a 28-bit value. This means that the maximum file system size as a function of fragment size is as follows:

$$228 \times \text{FragmentSize}$$

Journaled file systems are also restricted to 224 i-nodes. This limitation yields the following maximum file system size:

number of bytes per i-node (NBPI) x 224

The following table summarizes the restrictions on journaled file system size:

Begin_Table

NBPI Ratio (bytes)	Fragment Size (Megabytes)	Partition Size (Gigabytes)	Maximum File System Size
512	512, 1024, 2048, 4096	2	8
1024	512, 1024, 2048, 4096	2	16
2048	512, 1024, 2048, 4096	2	32
4096	512, 1024, 2048, 4096	4	64

End_Table

Journaled File System Log Size Issues

Another size-related issue is the size of the JFS log. Changes to JFS on disk control structures are recorded in a separate log logical volume.

In most instances, multiple journaled file systems use a common log configured to be 4MB in size. For example, after initial installation all file systems within the root volume group use logical volume hd8 as a common JFS log. The default logical volume partition size is 4MB, and the default log size is one partition, therefore, the root volume group normally contains a 4MB JFS log. When file systems exceed 2GB or when the total amount of file system space using a single log exceeds 2GB, the default log size may not be sufficient. In either case, the log sizes should be scaled upward.

NOTE: The log should contain 4MB of record space for each 2GB of file system space.

- The default log size may be implicitly increased by creating a volume group with a larger than 4MB partition size.
- On a newly created volume group, the crfs command creates the default log for the volume group. The size of this default log can be specified by using the -l <log_partitions> option of the crfs command.
- JFS logs may be created on an individual basis by using the mklv -t jfslog command followed by the logform command. To associate the new log with a file system, use the -a log=<log_name> option of either the crfs or the chfs command.
- The size of an existing log may be increased only if all file systems using the log are unmounted. After unmounting all necessary file systems, use the extendlv command to increase the size of the log logical volume followed by the logform command. Failure to unmount all file systems using the target log may result in file-system corruption and data loss.

PowerBook 1400: Why Does 1GB Hard Drive Show As 750MB? (12/96)

Revised: 12/18/96
Security: Everyone

PowerBook 1400: Why Does 1GB Hard Drive Show As 750MB? (12/96)

=====

Article Created: 17 December 1996

TOPIC -----

I have a PowerBook 1400c computer which was supposed to have come with a 1 gigabyte (GB) Hard drive. However, from what I can tell in the hard drive window, there is only a total of 750 megabytes (MB) of hard disk space. What's wrong?

DISCUSSION -----

Issue
=====

If your computer was supposed to have come with a 1 GB hard drive, it probably did, but it may have been formatted improperly. The improper formatting, in this case, causes 1 GB hard drives to appear to have less total disk space. The total space showing in the hard drive window is 750 MB. This formatting issue has been noted and corrected at Apple's manufacturing site. This issue should no longer be a factor in any new PowerBook computers.

Which Models Shipped With A 1 GB Hard Drive?
=====

Not all PowerBook 1400 computers shipped with 1 GB hard drives. Only the following models shipped with 1 GB hard drives.

M4856 Macintosh PowerBook 1400c/117
M5576 Macintosh PowerBook 1400c/133

How Can I Tell If My 1 GB Hard Drive Is Formatted Improperly?
=====

If you aren't sure whether or not your hard drive has been improperly formatted,

do the following:

Step 1

Open the hard drive window.

Step 2

Pull down the View menu.

Step 3

Select "by icon" from the menu.

Step 4

Add up the numbers for "in Disk" and "available". If these numbers add up to approximately 750 MB, then the drive will need to be reformatted to obtain the full size of 1 GB.

Resolution

=====

If your PowerBook computer has an improperly formatted hard drive, you will need to follow these steps to reformat* the drive:

* Note: Reformatting your hard drive will cause all the data files on the drive to be permanently erased. Be sure to save your important files to other media before reformatting.

Step 1

Back up the important data from your hard drive to another hard drive or to floppy disks. All of the software that came with your computer is contained on the CD that came with it, so you only need to back up the files you have created.

Step 2

Startup from the PowerBook System CD.

Step 3

Run Drive Setup to reformat/initialize the hard drive.

Step 4

Restore all the software from the PowerBook 1400 CD.

Step 5

Restart

When you open your hard drive window now the amount of space "in disk" and "available" should show that you have approximately 1 GB of hard drive space.

Network Server AIX: Altering the ODM (12/96)

Revised: 12/19/96
Security: Everyone

Network Server AIX: Altering the ODM (12/96)

=====

Article Created: 18 December 1996

TOPIC -----

On a Network Server 500 or 700 running AIX, I moved a PCI Ethernet card to another PCI slot. I was not able to remove the old device, however. The device was in the defined state, but it could not be removed even if I manually deleted the device. This leaves an "en1" device, and a configured "en2" device which should be "en1".

DISCUSSION -----

This is a special case where an object defined in the ODM could not be deleted by deleting the device. You can selectively alter the ODM with the following steps:

Step 1

Before running any "<odmdelete>" or "odmadd" commands, it is recommended that you save the original copies of the Cu* files, like this:

```
cd /etc/objrepos
cp CuAt cuat.old
cp CuDep cudep.old
cp CuDv cudv.old
cp CuDvDr cudvdr.old
cp CuVPD cuvpd.old
```

Step 2

In general, to find out what is in the ODM, you can run the odmget command. There are five files on which you would want to run odmget. These files are in /etc/objrepos; their names are CuAt, CuDep, CuDv, CuDvDr, and CuVPD. The syntax for odmget would be:

```
odmget CuAt > /tmp/cuat
```

```
odmget CuDep > /tmp/cudep
odmget CuDv > /tmp/cudv
odmget CuDvDr > /tmp/cudvdr
odmget CuVPD > /tmp/cuvpd
```

Then you can use pg, vi, or another editor on the /tmp/cu* files to "see" what is in the ODM. You can also "grep" for items, if you know what you are looking for, like this: (This assumes that you put the output of the odmget commands in the /tmp directory, in files beginning with the letters "cu".)

```
grep 'ent_name' /tmp/cu*
```

where "ent_name" is the word for which you are looking. For example:
grep ent2 /tmp/cu*

Step 3

WARNING: If you run "<odmdelete> -o CuAt", you will delete EVERYTHING in /etc/objrepos/CuAt! Consider backing up each /etc/objrepos/Cu* file if you have not already done so.

You can put the commands below in a file, make it executable, and run it. It will delete anything in the ODM that is associated with et2. You will want to also delete all ent2 entries.

Begin_Table

```
DEVICE=et2
    odmdelete -q "name      = $DEVICE" -o CuAt
    odmdelete -q "parent    = $DEVICE" -o CuDv
    odmdelete -q "name      = $DEVICE" -o CuDv
    odmdelete -q "name      = $DEVICE" -o CuDep
    odmdelete -q "dependency = $DEVICE" -o CuDep
    odmdelete -q "value1    = $DEVICE" -o CuDvDr
    odmdelete -q "value3    = $DEVICE" -o CuDvDr
```

End_Table

CD-ROM Discs: Joliet & Romeo Name Definitions (12/96)

Revised: 12/18/96
Security: Everyone

CD-ROM Discs: Joliet & Romeo Name Definitions (12/96)

=====

Article Created: 18 December 1996

TOPIC -----

When creating Compact Discs using CD-R drives, you may encounter the names Joliet and Romeo. This article discusses these file-naming conventions.

DISCUSSION -----

Joliet file-naming Convention
=====

When you choose Joliet, two file lists are maintained on the compact disc. The first file list is for long Windows 95 filenames (up to 64 characters). The second file list is for DOS-compatible filenames that are truncated from the Windows 95 filenames. The way this works for the second file list is that the first six or seven letters of each long filename are used, with the tilde(~) added at the end. A unique number appears after the tilde to prevent duplicate filenames.

Romeo file-naming Convention
=====

The Romeo file-naming convention used only on Windows 95 or Windows NT computers. Do not use Romeo if you want to read the compact disc on operating systems other than Windows 95 or Windows NT. When you choose Romeo file-naming convention during the writing of a CD session, only one file list is maintained on each CD. The Romeo file naming convention uses long Windows filenames (up to 128 characters).

AIX: TCP/IP Communication Failure, Cannot ping (12/96)

Revised: 12/18/96
Security: Everyone

AIX: TCP/IP Communication Failure, Cannot "ping" (12/96)

=====

Article Created: 18 December 1996

TOPIC -----

Tips for network communication failure, cannot "ping".

DISCUSSION -----

Communication on a network (using "ping", "telnet", "rlogin", and so on) requires the configuration of hardware and software to work correctly. If you have either a hardware failure, or a software communication problem, you may see anything from a slowdown in communication to 100% packet loss (no communication).

The "ping" command is often used to check network configuration. "ping" is a two part application, one part on the sending machine and the other on the receiving machine. When you send a ping to another host, the software dispatches packets. The packets activate a process at the receiving machine that responds by sending the packets back. If Machine A sends the packet, but the packet never reaches Machine B, you will see 100% packet loss from Machine A. If Machine B receives the packet, sends it back by a different route, and the packet gets lost, you will also see 100% packet loss on Machine A.

The following strategy for problem determination is divided as follows:

- Checking the Hardware
- Checking the Environment
- Checking the Configuration

Checking the Hardware

=====

Hardware Tip 1

Ensure that all plugs are secured and screwed down on the adapters.

Hardware Tip 2

View the status of existing adapters and interfaces (the adapter is the physical hardware; the interface is the software that enables communication on that hardware):

Execute the following to check the adapters and interfaces:

```
lsdev -C | pg
```

The following adapters may be listed:

```
ent#      Standard <Ethernet> Adapter or High Performance <Ethernet>
          Adapter
```

```
tok#      Token Ring High Performance Adapter
```

Verify that the adapter you are using is "Available". The term "Available" indicates that the Network Server recognized that this adapter was ready for use. If the adapter is "Defined", then you need to verify that your hardware is installed correctly. The term "Defined" indicates that the Network Server at one time knew it had available hardware in that slot but currently cannot identify that it has the hardware.

The following interfaces may be listed:

```
en#       Standard <Ethernet> Network Interface
et#       IEEE 802.3 <Ethernet> Network Interface
```

Verify that the interface you are using is "Available". If it is listed as "Defined", then you do not have your interface configured. The Standard <Ethernet> Adapter and the High Performance Adapter can utilize either the en# or et# interface. (These designate which protocols are available on the <Ethernet> style adapters.)

Hardware Tip 3

Check the error report by executing the following:

```
errpt -a | more
```

Look at the Date/Time line. The error log is in LIFO order (last in, first out) so the last error logged will be the first one displayed. If the date is not today's date, then you may not have a hardware error. If it is the current date, check the ERROR LABEL field for errors such as:

```
<Ethernet>
-----
ENT_ERR2
ENT_ERR4
ENT_ERR6
```

The above errors will generally mention that the error is hardware related. Reverify that all plugs are secured and screwed down on the adapters. You may want to reseal the adapters in their slots (proceed with caution) and then ping again and see if any more errors are reported.

Checking the Environment

=====

Environment Tip 1

Execute the following to check the network statistics:

```
netstat -m
```

If the last three lines have something other than "0" then your system may be exhibiting an "mbufs full" problem. Refer to IBM AIX Version 3.2/4.1 Performance Monitoring and Tuning Guide (SC23-2365).

```
26 mbufs in use:
16 mbuf cluster pages in use
70 Kbytes allocated to mbufs
0 requests for mbufs denied
0 calls to protocol drain routines
```

Kernel malloc statistics:

. . .

If the "requests for mbufs denied" line has something other than "0", your system may be exhibiting an "mbufs full" problem. Refer to the IBM AIX Performance Monitoring and Tuning Guide (SC23-2365-03).

Environmental Tip 2

Determine which machine is having the communication failure:

From Machine A, ping Machine B. On Machine B, execute the following:

```
arp -a
```

The output will look similar to:

```
ausvm3.austin.ibm.com (129.35.26.21) at 10:0:5a:ac:22:71 [token ring]
rt=a40:22a1:c211:bb11:d3a0

cia.austin.ibm.com (129.35.22.192) at 10:0:5a:a8:e1:9d [token ring]

risc.austin.ibm.com (129.35.28.168) at 10:0:5a:9:2c:b1 [token ring]
rt=830: 22 a1:c211:2270

ausname1.austin.ibm.com (129.35.17.2) at 10:0:5a:a8:2b:92 [token ring]
```

rt=a40: 22a1:c211:bb11:cff0

Check the listing for Machine A's hostname and IP address. If Machine A is NOT in the list, then packets never get from Machine A to Machine B. Either Machine A is the problem or something between Machine A and Machine B is the problem. If Machine B DOES have Machine A in the list, then either Machine B is the problem, or the return path to Machine A is a problem. Go back to the beginning of this fax and begin to work through the steps with Machine B.

Environmental Tip 3

If NIS is running, it may interfere with pinging by hostname. You may want to disable this option until ping and telnet are working to simplify problem determination. Then, once you can ping, enable NIS and see if you have ping problems. If you do, your NIS configuration needs to be reviewed for correctness.

To disable NIS, start smit with "smit communications" and choose the following:

NFS

Network Information Service (NIS)

Start / Stop Configured NIS Daemons

Then choose the appropriate stop items from those displayed:

Stop the Server Daemon, ypserv

Stop the Client Daemon, ypbind

Stop the yppasswdd Daemon

Stop the ypupdated Daemon

Environmental Tip 4

Verify that your netmask is correct. (A full discussion of a netmask is outside the scope of this document.)

		You can access Machines with IP
		addresses listed below without
		additional routing information
-----		-----
If your	If your	
Address is	Netmask is	
110.120.130.140	255.255.255.0	110.120.130.*
110.120.130.140	255.255.0.0	110.120.*.*
110.120.130.140	255.0.0.0	110.*.*.*

Checking the Configuration

=====

Configuration Tip 1

To verify that the hostname is still the correct hostname for this machine, execute the following:

hostname

The string returned should be the hostname of this machine. If the name returned was not what was expected, run "smit tcpip" and choose the following to set the hostname.

Further Configuration
Hostname

Configuration Tip 2

Verify that the IP address is what is expected by executing the following:

host your_hostname

The output should be similar to:

zcomm1.austin.ibm.com is 129.35.31.99

If the output is not what was expected, you need to correctly configure the IP address for this adapter or check the name resolution (see steps below).

Configuration Tip 3

Check to see if you are running Domain Name Service (DNS):

If /etc/resolv.conf exists, then you are using DNS. Disable DNS by renaming this file to some other filename:

mv /etc/resolv.conf /etc/resolve.conf.hold

If you can now ping, then something is wrong with DNS configuration. (In the /etc/hosts file, you may have to add the IP address and host of the machine you are trying to ping.)

Configuration Tip 4

Examine the /etc/hosts file. Verify that your hostname is in the file only once and that there is no corruption in the file. If your hostname belongs to two IP addresses, then the first hostname it finds in the file will be the IP address that is used. Also, check for a duplicate IP address.

Configuration Tip 5

Execute the following to ensure that software is loaded correctly:

lppchk -v

This will execute for a while and then come to a prompt. If any error messages are displayed, it indicates a possible install or update problem; correct the error and then try pinging.

Configuration Tip 6

Ping by hostname, then by IP address. Both should respond in the same manner. If they don't, check the /etc/hosts file again for duplicates.

Configuration Tip 7

Ping other machines, routers, etc. If only one machine is failing on the ping, your machine could have one of the following:

- a gateway problem
- a route problem

Configuration Tip 8

The following steps illustrate the procedure you will need to use to verify the adapter configuration:

```
netstat -i
```

The above command should produce output similar to the following:

Name	Mtu	Network	Address	Ipkts	Ierrs	Opkts	Oerrs	Col	l
lo0	1536	<Link>		149827	0	149827	0	0	
lo0	1536	127	localhost.xxxxx	149827	0	149827	0	0	
tr0	1492	<Link>		5603085	48642	89675	0	0	
tr0	1492	129.35.16	xxxxxx.xxxxxx.x	5603085	48642	89675	0	0	

Some fields and values you may see in the above output are:

tr0	Represents token ring interface
en0	Represents standard <Ethernet> interface
et0	Represents IEEE 802.3 <Ethernet> interface
lo0	Represents the loopback mechanism
Ierrs/Oerrs	Shows errors for incoming and outgoing packets

If you see only lo0, or if there is an "*" next to your interface, you need to configure the interface again.

Oerrs are bad and may point to a hardware error.

Ierrs generally indicate that your interface is receiving packets for which it does not recognize the format and is discarding them.

If you have checked everything and the ping is still not working and you are running <Ethernet>, try reversing protocols (en0 to et0 and vice versa).

As a final try, you can remove the interface and adapter and try starting again. You can do this from the command line:

```
ifconfig <interface> detach  
rmdev -d -l <interface>
```

```
rmdev -d -l <adapter>
```

Then you will need to reconfigure the adapters and interfaces. You can do that in any of these ways:

- Reboot, or
- In smit, choose:

```
Devices
```

```
Configure Devices Added After IPL
```

or

- From the command line, execute:

```
cfgmgr
```

The above procedures will configure interfaces in a defined state and adapters in an available state. Use normal procedures to customize the configuration for your system.

AIX snap Command and Troubleshooting (12/96)

Revised: 12/18/96
Security: Everyone

AIX snap Command and Troubleshooting (12/96)

=====

Article Created: 18 December 1996

TOPIC -----

This article describes the snap command and provides some troubleshooting help for users who may not know how to navigate AIX on a Network Server 500 or 700.

DISCUSSION -----

The snap command gathers system configuration information and compresses the information into a tar file. The file can then be downloaded to disk or tape, or transmitted to a remote system. The information gathered with the snap command may be required to identify and resolve system problems.

NOTE: Root user authority is required to execute the snap command.

Use the snap -o /dev/rfd0 command to copy the compressed image to diskette. Use the snap -o /dev/rmt0 command to copy the image to tape.

Approximately 8 MB of temporary disk space is required to collect all system information, including contents of the error log. If you do not gather all system information with the snap -a command, less disk space may be required (depending on the options selected).

The snap -g command gathers general system information, including the following:

- Error report
- Copy of the customized Object Data Manager (ODM) database
- Trace file
- User environment
- Amount of physical memory and paging space
- Device and attribute information
- Security user information

The output of the snap -g command is written to the

/tmp/ibmsupt/general/general.snap file.

You should run "snap -a". This will gather all information collected to a subdirectory under /tmp. Use "fdformat" to format a few disks. It should only take one if you delete the core file named unix in /tmp/ibmsupt/dump. Run "snap -o /dev/rfd0" to put the compressed files on the floppy disk.

Apple Media Tool 2.x: Setting QuickTime VR Correction (12/96)

Revised: 12/19/96
Security: Everyone

Apple Media Tool 2.x: Setting QuickTime VR Correction (12/96)

=====

Article Created: 19 December 1996

TOPIC -----

I have created my own QuickTime VR movies using the Apple Media Tool (AMT) 2.0. When I ply them with the QTVR Player, I have the option of selecting No Correction, Partial Correction, or Full Correction. I prefer No Correction, however when running the QTVR movies in AMT, some kind of correction is being performed. Is there a way to change the default correction in Apple Media Tool?

DISCUSSION -----

Version 2.0 of AMT does not allow you set the level of correction -- it defaults to full correction. However, AMT 2.1.1 allows you to set the correction level, similar to the way that the QTVR Player does.

To set the correction level using AMT 2.1.1, do the following:

Step 1

Add a QuickTime VR panoramic movie as a media element.

Step 2

Designate the movie as panoramic (click and hold until the menu appears)

Step 3

Double-click on the movie, the correction setting is available at the bottom of the dialog.

Apple Video System: How to Perform a Screen Capture (12/96)

Revised: 12/19/96
Security: Everyone

Apple Video System: How to Perform a Screen Capture (12/96)

=====

Article Created: 19 December 1996

TOPIC -----

I have the Apple Video System installed in my computer and was trying to capture a frame in Apple Video Player using the screen capture function of the Mac OS (Shift-Command-3). I hear the click sound, but when I open the picture file with SimpleText, the captured frame is missing - the Apple VideoPlayer window is black. How do I capture video frames?

DISCUSSION -----

Apple Video Player and the Video-In System does not support the screen capture function of the Mac OS to capture individual frames. To capture an individual frame, use the controls that are part of Apple Video Player.

How to Capture Video Frames

=====

Step 1

Open Apple Video Player.

Step 2

Select the camera icon from the Controls window.

Step 3

Click "Capture Picture" when the frame you want to save appears.

A dialog appears.

Step 4

Click Save.

Step 5

Enter a name for the file.

The file opens using SimpleText and shows the captured frame.

Korean Language Kit: Installation Options (12/96)

Revised: 12/19/96
Security: Everyone

Korean Language Kit: Installation Options (12/96)

=====

Article Created: 18 December 1996

TOPIC -----

This article contains questions about the installation options for the Korean Language Kit.

Questions Answered in this Article

=====

1) What are the minimum items needed to install the Korean Language Kit, and how much free space on the hard disk does this installation require?

2) What items are installed when I select the Easy Install option for the Korean Language Kit, and how much free space on the hard disk does this installation require?

3) What specific files and fonts are installed into the System Folder when I use the Easy Install option to install the Korean Language Kit?

4) What items do I need to Custom Install if I wish to install all of the items included with the Korean Language Kit, and how much free space on the hard disk does this installation require?

DISCUSSION -----

1) Question: What are the minimum items needed to install the Korean Language Kit and how much free space on the hard disk does this installation require?

Answer:

Minimum Install

=====

Choose Custom Install from the pop-up menu in the Korean Language Kit installer window. Check the following items to install the minimum items necessary to use the Korean Language Kit:

- * Korean Language Support, which includes:
 - Korean support files
 - System resources
 - Seoul font
 - Korean Input Method
 - Language Register
- * Read Me and SimpleText

This installation requires approximately 8 MB of free space available.

2) Question: What items are installed when I select the Easy Install option for the Korean Language Kit and how much free space on the hard disk does this installation require?

Answer:

Easy Install

=====

The following items are installed if you choose Easy Install from the pop-up menu in the Korean Language Kit installer window:

- * Korean Language Support, which includes:
 - Korean support files
 - System resources
 - Seoul font
 - Korean Input Method
 - Language Register
- * Read Me and SimpleText
- * AppleGothic Font
- * AppleMyungjo Font

Note that the only items that are installed beyond the Minimal Install are the AppleGothic and AppleMyungjo fonts.

This installation requires approximately 20 MB of free space available.

3) Question: What specific files and fonts are installed into the System Folder when I use the Easy Install option to install the Korean Language Kit?

The following files and fonts are installed when you use the Easy Install option to install the Korean Language Kit.

System Folder

=====

- Asian Font Arbitrator v1.0.3
- Font Cache
- Hanja.Dic

Fonts Folder

=====

- AppleGothic (suitcase)
- AppleGothic (file)
- AppleMyungjo (suitcase)
- AppleMyungjo (file)
- GHanja24Disk
- GSymbol24Disk
- Hanja24Disk
- Korean Font Icons v7.5.3
- KSSymbol12
- KSSymbol24Disk
- Seoul (suitcase)
- Seoul (file)

Extensions Folder

=====

- FontExtension (Bitmap).K42
- FontSize Patch v1.0
- Inline Support v1.1.3
- Inliner v2.2.3
- InputBackSupport v7.5.3
- Language Kit Additions folder (contains localized menu and dialog resources)
- Language Kit Extension v7.5.3
- Power Input Method v2.0
- WorldScript II v7.5.1
- WorldScript Power Adapter v7.5.3

4) Question: What items do I need to Custom Install if I wish to install all of the items included with the Korean Language Kit, and how much free space on the hard disk does this installation require?

Answer:

Full Install

=====

Choose Custom Install from the pop-up menu in the Korean Language Kit installer window. Check the following items to install all of the items included with the Korean Language Kit:

- * Korean Language Support
 - Korean support files
 - System resources
 - Seoul font
 - Korean Input Method
 - Language Register
- * Read Me and SimpleText
- * AppleGothic Font
- * AppleMyungjo Font
- * Gungseoche Font
- * Pilgiche Font

Note that the only items that are installed beyond the Easy Install are the Gungseoche and Pilgiche fonts.

..TIL20758-Korean_Language_Kit-Installation_Options_12-96_(TA36317).pdf

This installation requires approximately 30 MB of free space available.

Performa 6360 & 6400 Video Editing: Can't Register (12/96)

Revised: 12/19/96
Security: Everyone

Performa 6360 & 6400 Video Editing: Can't Register (12/96)

=====

Article Created: 19 December 1996

TOPIC -----

When I try to register my Macintosh Performa 6360 or Macintosh Performa 6400 Video Editing System computer, I do not see an option for my computer. Does this mean I have the wrong software bundle?

DISCUSSION -----

The registration Model Number pop-up menu only shows options for the Macintosh Performa 6400/180 and 6400/200, which are very similar to your computer. This software was originally introduced on those computers, but the release of the Macintosh Performa 6360 and Macintosh Performa 6400 Video Editing System followed soon thereafter.

For the purposes of registration, choose one of the Macintosh Performa 6400 options. Although the software was inadvertantly not updated for your computer, this will not affect your registration process. Also, you do have the correct software bundle for your computer.

Macintosh Performa 6360 & 6400: Voice Answered as Fax (1/97)

Revised: 1/15/97
Security: Everyone

Macintosh Performa 6360 & 6400: Voice Answered as Fax (1/97)

Article Created: 19 December 1996
Article Reviewed/Updated: 15 January 1997

TOPIC -----

I am using Megaphone and the Apple Telecom fax software which was bundled with my Macintosh Performa 6400 series computer. Sometimes when a voice call is coming through, the fax software seems to take over and attempts to handle the voice call as a fax. How can I prevent this from happening?

DISCUSSION -----

To prevent voice calls from being answered as fax calls, follow these steps:

Step 1

Choose Control Panels from the Apple menu, and open the Express modem control panel.

Step 2

Click on the "On" radio button to turn on the Express Modem.

Step 3

Click on the "Auto-answer incoming calls" check-box to enable the receiving capability.

Step 4

Click on the General Settings pop-up menu and choose "Advanced Options."

Step 5

Verify that the "Voice application" radio button is selected. The dialog should read "Transfer incoming calls which cannot be identified to: "Voice

application."

Step 6

This step is optional. If steps 1 through 5 do not work, try resetting PRAM (parameter RAM) by restarting your computer while pressing and holding the CMD-OPT-P-R keys until you hear the startup chimes the second time.

Article Change History:

15 Jan 1997 - Added step 6.

AppleScript and Clipboard From Finder (12/96)

Revised: 12/20/96
Security: Everyone

AppleScript and Clipboard From Finder (12/96)

Article Created: 20 December 1996

TOPIC -----

We're trying to get information from the clipboard in AppleScript. The following AppleScript works with the Scriptable Text Editor.

```
tell application "Scriptable Text Editor"
    activate
    select first word of window 1 -- there's text in window 1
    copy
    set WordOne to clipboard as text
    display dialog WordOne
end tell
```

However, trying something similar in the Finder does not work. We manually copied the name of a folder, then tried to write a script that would display the contents to the clipboard. Although selecting "show clipboard" from Edit menu shows text on clipboard, the following script does not work, the clipboard appears empty:

```
tell application "Finder"
    set ClipBoardData to clipboard as text
    display dialog ClipBoardData
end tell
```

What gets displayed is "" (nothing). If I go to the Scriptable Text Editor and tell it the same thing, it displays the folder name.

DISCUSSION -----

There are several AppleEvent Suites, such as Text, Database, Telephony, Finder, and so on that are defined and generally agreed upon by developers. Manipulation of the Macintosh clipboard is covered in the Miscellaneous Apple Event Suite. In that suite are defined the ways that applications should implement Cut, Copy and Paste, undoing and redoing operations, creating Edition Manager publishers,

initiating and ending transactions, and other miscellaneous actions. Not all applications support all of the actions in this suite and so do not implement these functions. Some applications implement the suite partially or under the guise of their own custom suite.

The Scriptable Text Editor did not implement the complete Miscellaneous Suite, but Scriptable Text Editor does implement Cut, Copy and Paste as part of what they call the Scriptable TE suite. The Finder did not implement the Miscellaneous Suite or Cut, Copy and Paste as a subset anywhere. This is why your AppleScript gives desired results with Scriptable Text Editor, but not with the Finder.

Jon Pugh, an Apple employee, saw the need to extend the capabilities of AppleScript back in the days before the Scriptable Finder became available. He has released a package of "Free for noncommercial use" Scripting Additions known as Jon's Commands. The extended commands include:

- clipboard info - get a list of data on the clipboard
- set the clipboard to - put data on the clipboard
- the clipboard - get data from the clipboard

This particular set of commands is so popular that Jon separated the clipboard extensions into a stand alone Scripting Addition called clipboard.

At Ease 4.0.1 Updater Installation Issue (12/96)

Revised: 12/20/96
Security: Everyone

At Ease 4.0.1 Updater Installation Issue (12/96)

Article Created: 20 December 1996

TOPIC -----

This article describes an installer issue of the At Ease 4.0.1 Updater.

DISCUSSION -----

The At Ease 4.0.1 Updater attempts to patch three files:

- At Ease - In the System Folder of At Ease Workstations
- At Ease Startup - In the Extensions folder of At Ease Workstations
- At Ease Administration - An application located in the Network Administrator Toolkit folder of computers with the administration software installed.

If a user performed a custom installation of the At Ease Administration software without installing the workstation software (which is a supported configuration), the At Ease and At Ease Startup files will not be present in the system.

The first file the updater needs to patch is At Ease. If the user does not have this file installed and tries to skip it, the updater will cancel the update.

This issue has been reported to Apple engineering, however, there is no known date a fix will be available.

Workaround

Perform one of the following:

- Install the workstation software on the administration computer before running the update,

or

- Copy the At Ease and At Ease Startup files from a workstation to a floppy disk. Insert the floppy disk into the administration computer before running the update. When the updater asks you to locate the file "At Ease" point it at the file located on the floppy disk. It will then let you update the At Ease Administration program on the hard disk of the Administrator computer.

PowerBook 1400: Low Battery Warning Is Too Early (12/96)

Revised: 12/20/96
Security: Everyone

PowerBook 1400: Low Battery Warning Is Too Early (12/96)

=====

Article Created: 16 December 1996

TOPIC -----

I have a PowerBook 1400 series computer which seems to get the first battery warning message as early as 30 minutes. Why does this happen?

DISCUSSION -----

Some PowerBook 1400 owners have noted that the first battery low warning message does occur earlier than expected. Apple is aware of this issue. The first battery warning message is not a good prediction of the total battery life. There are three warnings before the battery completely runs out. To truly test the battery life you should run the computer from the battery until the third (last) battery warning appears.

The computer should run from the battery for over an hour even if you have taken no steps to conserve power. A few of the things that affect battery life include: CD usage, PC card usage, screen brightness, hard disk access/usage, the amount of RAM installed, and whether or not processor cycling is enabled.

Note: Battery recharging takes longer if you use a power adapter designed for the PowerBook 200 or 2300 (Duo) series computers instead of the 45 Watt power adapter that shipped with the PowerBook 1400 series computer.

At Ease 4.0: -5000 Error When Launching CD-ROM Discs (12/96)

Revised: 1/6/97
Security: Everyone

At Ease 4.0: "-5000" Error When Launching CD-ROM Discs (12/96)

=====

Article Created: 20 December 1996

TOPIC -----

When I try to launch an application from a CD-ROM disc on our workstations using At Ease 4.0, part of Apple Network Administrator Toolkit (ANAT), I get a "-5000" error. What am I doing wrong? I have allowed access to all CD-ROM discs in the At Ease Administration application, I thought this should be enough.

DISCUSSION -----

You are correct, allowed access to all CD-ROM discs in At Ease Administration should be enough. However, some applications on CD-ROM discs require that they sublaunch other applications. To fix this, open the At Ease Administration application, choose the System Settings command under the Security menu, and select the "allow sublaunching" radio button. This will resolve this issue.

Pulse Dialing With MacPPP 2.5.1 (1/97)

Revised: 1/6/97
Security: Everyone

Pulse Dialing With MacPPP 2.5.1 (1/97)

Article Created: 3 January 1997

TOPIC -----

This article provides direction on access your ISP through Pulse Dial using MacPPP 2.5.1.

DISCUSSION -----

These directions will let you access your ISP through Pulse Dial when using MacPPP 2.5.1. It assumes the Apple Internet Connection Kit Version 1.2 has been installed, and you already have an ISP (Internet Service Provider) account established.

Step 1

Open Config PPP. You can double click the Config PPP file which is found in the following path:

Internet Connection Kit:Internet Utilities:Config PPP

Step 2

Access the Terminal Window. Select the Terminal Window checkbox in the Config PPP Window. Click Open for a PPP Terminal Window.

IMPORTANT: Be sure to deselect the Autodetect PPP Startup checkbox.

Step 3

Instruct the Modem to dial your ISP's access telephone number. Type in the window "ATDP", followed by the telephone number, then press the Return key. For example, the number 555-1212 would be entered like this:

ATDP5551212<Return>

Step 4

Start the PPP Protocol. As soon as the modem reports Connect, click the Start PPP button.

NOTE: Timing is important, you must wait for the "Connect" message and start the PPP Protocol (click the Start PPP button) before the window starts showing other information.

Expected Results

You should see the MacPPP Connection Status window track the logon progress.

Troubleshooting

If you experience problems confirm the following:

- Verify that your account information valid. Confirm your account name, password and the access telephone number with your ISP.
- Make sure that either the MacTCP, or TCP/IP control panel specify MacPPP as the connection method.
- Is the Autodetect PPP Startup checkbox in the PPP Terminal Window deselected? In other words, does the checkbox have an "x" in it? If it does, deselect or remove the "x" by clicking on it.
- Attempt the connection again, remember timing is important when you click the Start PPP Button.

Math - Grades 5-8 bundle: Current Issues (1/97)

Revised: 1/6/97
Security: Everyone

Math - Grades 5-8 bundle: Current Issues (1/97)

=====

Article Created: 6 January 1997

TOPIC -----

This article contains a list of known issues with the Math: Grades 5-8 bundle V3.4.

DISCUSSION -----

- Probability Constructor is unable to print to a Color StyleWriter 2500 when Background Printing is enabled.

Workaround: Disable Background printing. This is documented in the bundle's documentation.

- Probability Constructor: printing to a LaserWriter may cause the computer to freeze. There is no workaround. This is documented in the bundle's documentation.

- Tesselmania! does not support desktop printing.

Workaround: Print from within Tesselmania! application.

- Tesselmania! cannot run properly with a display of more than 256 colors.

Workaround: Set display to 256 colors. This is documented in the bundle's documentation.

Note:

Measurement in Motion installs system software extensions QuickTime, and Sound Manager, or allows you to drag-install these extensions.

Network Administrator Toolkit: Three Error Messages (1/97)

Revised: 1/7/97
Security: Everyone

Network Administrator Toolkit: Three Error Messages (1/97)

=====

Article Created: 7 January 1997

TOPIC -----

This article describes three error messages of the Apple Network Administrator Toolkit (ANAT).

DISCUSSION -----

1) Question: When I startup my AppleShare/At Ease for WorkGroups 4.0 server, I get the following message, "Unable to initialize At Ease Server." What is causing this error message?

Answer: AppleTalk is inactive.

If you are using Open Transport, open the AppleTalk control panel, click OK in the dialog asking if you want to make AppleTalk active, close the AppleTalk Control panel, and click Save. Then restart the server.

You can also open the Chooser, click the AppleTalk Active radio button, close the Chooser window and click OK. Then restart the server.

If you are using Classic AppleTalk, use the Chooser to make AppleTalk active. Then restart the server.

NOTE: You must restart the server in order to initialize the At Ease Server.

2) Question: On a different AppleShare/At Ease for WorkGroups 4.0 server I get a second message after the one above. It says "AppleShare Agent: Unable to create ADSP listener. Unable to open port. Make sure AppleTalk is turned on in the Chooser (Error: -98)". Why don't I get this message, which clearly says AppleTalk needs to be turned on, on the first server?

Answer: This second server is using Open Transport and has the AppleShare Agent extension installed, which is used by the User & Group Manager application to

administer AppleShare File Server users & groups.

3) Question: On a third AppleShare/At Ease for WorkGroups 4.0 server I get a second message after the first one. It says "AppleShare Agent: Unable to create ADSP listener. Error Code: -23". Why doesn't this message indicate that AppleTalk needs to be turned on?

Answer: This server is using Classic AppleTalk instead of Open Transport.

Early Language Connections bundle: Current Issues (1/97)

Revised: 1/8/97
Security: Everyone

Early Language Connections bundle: Current Issues (1/97)

=====

Article Created: 7 January 1997

TOPIC -----

This article contains a list of known issues with the Early Language Connections bundle V5.2.

DISCUSSION -----

- At Ease sometimes draws a gray menu bar. However, the menu is still active and functional.
- At Ease and Energy Saver: If you skip the configuration of Energy Saver, and do set-up At Ease, an error message appears from At Ease upon launching.

Workaround: This issue and the workaround is documented in the Early Language Connection Bundle documentation.

- At Ease: when "Speak Button Names" is enabled and Virtual Memory is active, the voice stutters when the button name is spoken.

Workaround: Turn-off Virtual Memory.

- Muppets on Stage: Pressing Command-period causes Muppets On Stage to quit. There is no workaround.
- SuperPrint does not support desktop printing.

Workaround: Print from within the SuperPrint application.

- Grady Profile: when the date is asked for, the default year displayed is "94-95". The year can be changed and does not affect the performance of the application.

Note:

Cinderella, Paperbag Princess, Peter Rabbit, and Mud Puddle install the system software extensions QuickTime, and Sound Manager, or make them available for you to drag-install.

Writing and Publishing Tools bundle: Current Issues (1/97)

Revised: 1/7/97
Security: Everyone

Writing and Publishing Tools bundle: Current Issues (1/97)

=====

Article Created: 7 January 1997

TOPIC -----

This article contains a list of known issues with the Writing and Publishing Tools bundle v1.1.

DISCUSSION -----

- At Ease sometimes draws a gray menu bar. However, the menu is still active and functional.
- Using At Ease to launch ClarisWorks, you are unable to access help features.

Workaround: Add "Claris Quick Help" to the application list for all users using the application preferences in At Ease.

- American Heritage Dictionary may sometimes crash with "Couldn't complete the last command because there was not enough memory...Result Code = -108".

Workaround: Increase application memory size to reduces the chance of encountering this error.

- Cannot get Aspects to work with ClarisWorks documents.

Workaround: The errata provides information about getting an upgrade which provides this feature.

- At Ease: when "Speak Button Names" is enabled and Virtual Memory is active, the voice stutters when the button name is spoken. This problem does not otherwise affect the performance of the application.

Workaround: Turn-off Virtual Memory.

- Digital Chisel: When quitting Digital Chisel, navigation window may sometimes remain open.

Workaround: Close navigation window, then quit.

- Media Weaver unable to paste pictures copied from the Scrapbook. There is no workaround.

Note:

Digital Chisel and MacLink Plus install the system software extensions QuickTime, and Sound Manager, or make them available for you to drag-install.

Button Disabler CP: Doesn't Work w/Power Macintosh 5400 (1/97)

Revised: 1/7/97
Security: Everyone

Button Disabler CP: Doesn't Work w/Power Macintosh 5400 (1/97)

=====

Article Created: 7 January 1997

TOPIC -----

I have a Power Macintosh 5400 and want to use the Button Disabler control panel that shipped with my Power Macintosh 5200. After installing this control panel, it says that it will not work with this Macintosh. Is this correct?

DISCUSSION -----

Yes. This is correct. Button Disabler version 1.1 was the last version of the control panel released by Apple as part of System Software 7.5. The Power Macintosh 5200/75, 5260/100 and 5300/100 computers shipped with a System Software 7.5 based installer. This installer for these computers was created from System Software 7.5. This computer specific installer allows users to custom install the Button Disabler control panel v1.1. The Power Macintosh 5260/120*, 5400/120 and 5400/180 computers currently ship with a System Software 7.5.3 based installer which does not include the Button Disabler control panel.

***NOTE:**

The Power Macintosh 5260/120 does not ship with the Button Disabler control panel. However, since the Power Macintosh 5260 logic board is based on the Power Macintosh 5200/5300 logic board, the control panel should install and work correctly.

QuickDraw 3D v1.5: Supports Multiprocessing (1/97)

Revised: 1/7/97
Security: Everyone

QuickDraw 3D v1.5: Supports Multiprocessing (1/97)

=====

Article Created: 7 January 1997

TOPIC -----

I've installed QuickDraw 3D version 1.5 on my 9500/180MP. I heard that QuickDraw 3D took advantage of my multiprocessor - but I can't really see an increase in performance. My application seems to render 3D files at the same speed. Can you explain this?

DISCUSSION -----

When properly installed, QuickDraw 3D 1.5 is both multiprocessor and hardware acceleration aware. However, features such as Virtual Memory, Energy Saver and the amount of RAM available, can affect performance of multiprocessor aware applications and support libraries.

QuickDraw 3D 1.5 marks the first step in offering multiprocessor functionality, seen primarily when using the interactive renderer with large datasets (models). Future releases of QuickDraw 3D will include additional performance enhancements.

For more information on Apple Power Macintosh Multiprocessor equipped computers, look at the Tech Info Library article titled "Power Macintosh Multiprocessor FAQ".

AppleShare IP 5.0 Beta: Product Information (1/97)

Revised: 1/8/97
Security: Everyone

AppleShare IP 5.0 Beta: Product Information (1/97)

=====

Article Created: 8 January 1997

TOPIC -----

This article provides AppleShare IP 5.0 Beta product information.

DISCUSSION -----

IMPORTANT: This is Beta Software and is Not Supported

About AppleShare IP

=====

AppleShare IP 5.0 Beta is an open, extensible platform allowing Mac OS developers to add, enhance or replace existing services or tailor services to specific user needs. As the AppleShare IP 5.0 Admin panel is an OpenDoc container, Mac OS developers can extend functionality for easier network administration.

The AppleShare IP 5.0 Beta software provides an expanded set of network services, including file, mail, print and web. These services are managed by the following programs:

- AppleShare IP 5.0 AppleTalk File Protocol (AFP) Server Beta
- The Apple Macintosh Workstation Client 3.7 Beta
- The AppleShare IP 5.0 Web Server Beta
- The AppleShare IP 5.0 Mail Server Beta
- The AppleShare IP 5.0 Print Server Beta

The AppleShare IP 5.0 AppleTalk File Protocol (AFP) Server Beta includes support for both TCP/IP and AppleTalk. When used in conjunction with Apple Macintosh Workstation client version 3.7, customers keep the familiar Macintosh interface, but TCP/IP is used as the underlying transport protocol. Customers benefit from both the advantages of TCP/IP and AppleTalk.

..TIL20778-AppleShare_IP_5-0_Beta-Product_Information_1-97.pdf

The Apple Macintosh Workstation Client 3.7 Beta supports AppleTalk and TCP/IP protocols. AppleTalk support is included to provide backward compatibility for Personal File sharing and AppleShare 3.x/4.x File Servers. The Apple Macintosh Workstation Client 3.7 Beta allows users to type in an IP address to connect to the AppleShare IP 5.0 Server. And aliases contain both AppleTalk and TCP/IP information.

The AppleShare IP 5.0 Web Server Beta includes CGI support and implements an HTML (Hypertext Markup Language) folder. Files placed within this folder are published using the AppleShare IP 5.0 Web Server. Simplifying the configuration process, security and administration are shared with the file server resulting in lower administration time and less complexity for users.

The AppleShare IP 5.0 FTP (File Transfer Protocol) Beta server supports all common FTP commands, anonymous logins and includes BinHex and MacBinary encoding allowing users to collaborate and share files within the local network and across the Internet from remote locations. The AppleShare IP 5.0 FTP Beta Server automatically Binhex files when requested by an FTP client eliminating the need for administrators to store duplicate files on the server.

The AppleShare IP 5.0 Mail Server Beta provides fast and simple Internet/Intranet email utilizing POP3 (Post Office Protocol version 3)/SMTP (Simple Mail Transport Protocol) mail services compatible with nearly every POP3/SMTP mail client on the market allowing users can access their mail from any client machine -- MacOS Windows, Unix, OS/2. Its robust feature set includes SMTP routing with full support for DNS (Domain Name Services) mail routing, APOP authentication, auto-forwarding and server logging. The AppleShare IP 5.0 Mail Server also supports both AppleTalk and TCP/IP.

The AppleShare IP 5.0 Print Server Beta supports up to 30 printers, 10 queues and 32 simultaneous print sessions freeing users waiting for print jobs. It provides load balancing -- allowing for faster print queue processing by distributing print jobs among multiple printers, LaserWriter 8.4 support, Postscript level 2 and server side PPD (PostScript Printer Descriptions) support.

Technology Information

=====

AppleShare IP 5.0 Beta is backwards compatible with previous AppleShare servers to provide services for both Mac OS and Windows clients and is compatible with all versions of the Macintosh Workstation client. To take advantage of all the benefits of AFP over TCP/IP, users should upgrade their Apple Macintosh Workstation client to version 3.7. The Apple Macintosh Workstation client version 3.7 is included with AppleShare IP 5.0 Beta.

AppleShare IP 5.0 Requirements:

- Apple Power Macintosh with a PowerPC 601, 604 or 604e microprocessor
- Macintosh System Software Version 7.6 or later
- Open Transport 1.1.2 (included) or later
- a minimum of 24MB of RAM
- minimum of 10MB of available hard disk space

- a CD-ROM drive.

Software Notes

=====

Non-Supported Beta Software

AppleShare IP 5.0 Software Disclaimer: AppleShare IP 5.0 beta1 Seed is a technology evaluation release and will expire on April 7, 1997. This is not a supported product, but we encourage you to try it and give us feedback. This copy is for evaluation purposes only and is offered at no charge. We cannot guarantee that any subsequent releases will be offered free of charge, but we suggest that you check back frequently for any revisions of this design release.

AppleShare IP 5.0 Beta not Fault-tolerant

The AppleShare IP 5.0 Beta technology is not fault-tolerant and is not designed, manufactured or intended for use or resale as on-line control equipment in the operation of nuclear facilities, aircraft navigation or communication systems, or air traffic control machines in which the failure of the AppleShare IP 5.0 Beta technology could lead directly to death, personal injury, or severe physical or environmental damage. To download this software product, please fill out our short customer survey. Upon completion of the survey, you will be asked to read the license agreement in the language of your choice. After agreeing to the license agreement, you will be able to download the software.

AppleShare IP 5.0 Beta: Technology Information (1/97)

Revised: 1/8/97
Security: Everyone

AppleShare IP 5.0 Beta: Technology Information (1/97)

Article Created: 8 January 1997

TOPIC -----

This article provides AppleShare IP 5.0 Beta technology information.

DISCUSSION -----

IMPORTANT: This is Beta Software and is Not Supported

Apple Macintosh Workstation Client 3.7

The Apple Macintosh Workstation Client 3.7 beta supports AppleTalk and TCP/IP. Since AppleTalk is always active on the AppleShare IP 5.0 Beta Server, a user will be able to select an AppleShare IP 5.0 server by name (NBP protocol) through the Chooser if AppleTalk is routed on the local network.

During the login procedure, the Apple Macintosh Workstation 3.7 client will query the server to determine if the server supports TCP/IP and/or AppleTalk. If the server supports AFP over TCP, then the Apple Macintosh Workstation Client 3.7 will use TCP/IP as the transport mechanism for AFP. From the end user's perspective, their experience is the same and the server volume appears on their Macintosh desktop. However, the underlying transport is TCP/IP.

If the server does not support AFP over TCP/IP then it will revert to using AppleTalk as the transport mechanism. This was implemented in order to support MacOS Personal File sharing and servers implementing AFP over AppleTalk, such as AppleShare 3.x and 4.x servers.

In the case that AppleTalk is not routed on the network, the Apple Macintosh Workstation Client 3.7 allows the end user to type in the server's IP address or DNS name to initiate the login process.

Since the Apple Macintosh Workstation Client 3.7 supports AppleTalk and TCP/IP, aliases made of AppleShare IP 5.0 volumes contain the necessary AppleTalk and

TCP/IP information.

AFP over TCP Specification 2.2

This is on its way.

FTP and File Encoding/Decoding

The logic for conversions (MacBinary vs. BinHex) depends on the data type that the client has selected. There are two main data types: text and binary.

For Retrieving a file:

- If the data type is text and the file is a text file, it will be converted to the standard Telnet text type (CR gets replace with a CRLF).
- If the data type is text and the file is not a text file, it will be converted to BinHex.
- If the data type is binary and MacBinary is enabled, the file will be converted to MacBinary format.
- If the data type is binary and MacBinary is not enabled, only the data fork will be sent.

For Storing a file:

- If the data type is text, the MIME function is used to determine whether the data stream is likely to be text or BinHex.
- If text or BinHex, it will attempt to do the conversion on the fly.
- If not text or BinHex, it will just write out the data to the data fork of the new file. It will also fall back to writing the data fork if it discovers that the file is not in the format the MIME type had guessed.
- If the data type is binary, the MIME function is used to determine whether the data stream is likely to be in MacBinary or not.
- If it is, then it will attempt to convert it on the fly. If not, it will just write the data to the data fork. If the MacBinary guess is later found to be incorrect, it will just write everything out to the data fork.

Macintosh Performa: Can't record while using GV Modem (1/97)

Revised: 1/8/97
Security: Everyone

Macintosh Performa: Can't record while using GV Modem (1/97)

=====

Article Created: 8 January 1997

TOPIC -----

I have a Macintosh Performa 5200 and I am using the Global Village Gold IIv modem. When I am online and the modem is in use, I cannot record any kind of sound. When I try using the Sound control panel, I get an error stating that "The sound input device is already in use and cannot be used for recording." If I use SimpleText to record the sound, I get a slightly different error: SimpleText cannot record at this moment. Another application may be using the Sound input."

What should I do?

DISCUSSION -----

If you are using a Macintosh Performa 5200, 6200, 5300, 6300, 5260, or 6320 series computer and either a Platinum V or Gold IIv modem, you may experience the problem you described.

The Global Village Toolbox, in order to route sound from the modem through the internal speakers, needs to use the sound hardware. Therefore, sound input is disabled.

If you need to use your microphone while simultaneously online, you need to disable the Global Village Toolbox. You can do this using the Extensions Manager control panel, then restart your computer.

Having the Global Village Toolbox disabled should not affect the performance of your data connections using either the Gold IIv or Platinum V modem.

IMPORTANT:

In order to use the fax capabilities of your modem, you need to enable the Global Village Toolbox.

PowerBook 1400: Not An HFS Disk & Installation Errors (1/97)

Article Created: 9 January 1997
Article Reviewed/Updated: 15 January 1997

TOPIC -----

I just got a new PowerBook 1400 series computer. I started up with extensions off. Then I tried to install some software, but it kept crashing and freezing during the installation process. The same installation disks work with my other PowerBook 1400. I ran Disk First Aid on the internal hard drive and it says, "this is not an HFS disk." What could be wrong?

DISCUSSION -----

ISSUE
=====

A limited number of PowerBook 1400 series computers were shipped out with their hard drives not formatted properly. If you run Disk First Aid on your PowerBook computer and get the message that "this is not an HFS disk", then your computer's hard drive has this formatting problem. Another symptom of not having the hard drive formatted correctly is that software cannot install properly onto the hard drive.

RESOLUTION
=====

To resolve this issue you need to download and install the PowerBook 1400 HD Updater. It is available free from Apple on a variety of online services.

What Is the PowerBook 1400 HD Updater?
=====

The PowerBook 1400 HD Updater is designed to provide a reference file that may not have been copied onto the hard disks of some Macintosh PowerBook 1400 series computers. The reference file is not needed for normal operation of the PowerBook computer.

Disk utility programs, such as Disk First Aid, look for the reference file. If the file is not on the hard disk and you use Disk First Aid or another disk utility, you will see a message reporting that the hard disk is not an HFS volume and cannot be checked by the program. (The message may be somewhat different with a disk utility other than Disk First Aid.)

Who Needs to Use the Updater?

=====

If the reference file is not on your computer's hard disk, you should use the PowerBook 1400 HD Updater to copy the file on the disk. To determine whether you need to use the Updater, follow these steps.

Checking Your Hard Disk

1. Locate Disk First Aid (in the Utilities folder on your hard disk) and open it by double-clicking its icon.
2. Click the icon of the hard disk to select it.
3. If you see a message that you can't repair the startup disk, click OK. (You want to verify the disk, which can be done on the startup disk.)
4. Click Verify.
5. If you see a message "This drive is not an HFS disk," you need to use the PowerBook 1400 HD Updater. (If a status message appears reporting the progress of verification, you do not need to use the Updater. You can click Stop to end the verification process.)

Using the PowerBook 1400 HD Updater

1. Copy the Updater to your computer's hard disk.
2. Double-click the Updater's icon to open it. The Updater automatically copies the reference file on your hard disk.
3. Click OK to quit the Updater.

It is a good idea to check your hard disk after using the Updater. To do this, run Disk First Aid and select the Verify option. If Disk First Aid reports a problem, follow the instructions on the screen. You can also use the Drive Setup program (in the Utilities folder) to check the hard disk. See "Testing Your Hard Disk" in Chapter 7 of the PowerBook 1400 manual for your computer for more information about testing the drive.

Using the Updater will not cause any problem if the reference file is already on the hard disk.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Performa 6360/6400: How to Restore the Performa Demo (2/97)

Revised: 2/26/97
Security: Everyone

Performa 6360/6400: How to Restore the Performa Demo (2/97)

=====

Article Created: 9 January 1997
Article Reviewed/Updated: 26 February 1997

TOPIC -----

I have just restored the Guided Tour on my Macintosh Performa 6360 (or 6400) computer. The Performa Intro and Demo do not automatically appear as I expected they would. How do I restore the Intro and Demo so they launch automatically like it did when I originally powered on my Macintosh Performa 6360 (or 6400) computer?

DISCUSSION -----

There is nothing wrong with the Guided Tour CD. Below are the steps to restore both the Performa Intro and Performa Demo so it behaves as it did when the computer was first turned on out of the box. These directions apply to both the Macintosh Performa 6400 and the Macintosh Performa 6360 computers.

Step 1

After restoring all software to the hard drive, restart your computer with either the "Macintosh Performa 6400 Series Guided Tour" or "Macintosh Performa 6360 and 6400 Series Guided Tour" compact disc.

Step 2

Choose Restore Guided Tour button from the Launcher window.

Step 3

Restart the computer after restoration is complete.

Step 4

Open the Apple Extras folder inside the hard disk.

Step 5

Open the Performa Extras folder.

Step 6

Open the Peforma Demo folder.

If you do not see a "Launch Performa Demo" icon, open the Media folder. Newer versions of the Performa Demo (the "Macintosh Performa 6360 and 6400 Series Guided Tour" and later) do not place the Launch Performa Demo applet at the top level of the Performa Demo folder.

Step 7

Make an alias of the "Launch Performa Demo".

(select the icon, then choose Make Alias from the File menu [the keyboard shortcut is Command-M]).

NOTE: Do NOT make an alias of the "Performa Demo" applet. To be properly run, the Launch Performa Demo applet must be run first; it sets up the operating environment so that the Performa Demo can run well. Typical indications that the wrong file has been used include the regular Launcher overlapping the regular demo startup, and possibly an error dialog indicating that the user must reset the number of colors in use.

Step 8

Put this alias into the Startup Items folder in the System Folder.

Step 9

Restart your computer.

After the computer restarts, the Performa Intro and Demo work just like they did when the computer was first powered up out of the box.

How to Set Up At Ease for Workgroups and ClassWorks (1/97)

Revised: 1/9/97
Security: Everyone

How to Set Up At Ease for Workgroups and ClassWorks (1/97)

=====

Article Created: 9 January 1997

TOPIC -----

I'm trying to use At Ease for Workgroups 4.0 with ClassWorks 3, a courseware package from EPC. At Ease was working fine before I installed ClassWorks 3, however, after the installation the workstations now give me an error message indicating they cannot find the At Ease server.

Based on the setup suggestions in the At Ease manual, I made some changes to the AppleShare file server. I put the Documents and At Ease Items WG folders inside a new folder called At Ease, and changed the access privileges on the server so the new folder is now the shared volume for At Ease. After re-configuring the At Ease server information at my Administrator workstation, all my workstations can see the server and At Ease is working fine again.

However, when I run the ClassWorks application and try to log in as a user, from inside the ClassWorks application, I get an error message that the data file could not be found or a -54 error. Why am I getting these errors, and how should I setup the server so both At Ease and ClassWorks work together?

DISCUSSION -----

The access privileges on the AppleShare file server are set incorrectly. Follow the steps below to obtain the correct access privileges for both At Ease for Workgroups and ClassWorks.

NOTE: The "CW3" user referred to below is the user name EPC sets up when installing ClassWorks 3.

Overview
=====

Move the Documents and At Ease Items folders to the root or top level of the boot or startup volume. Share the entire boot volume with Read Only privileges

for user CW3. Change the privileges for only the following folders to Read/Write
for user CW3:

Documents
At Ease Items WG
ClassWorks 2xxx

NOTE: It is important that the privileges be set to Inherit, not Explicit, and
that the Courseware folder be Read Only.

Start the Administrator workstation and enter the new Volume name for At Ease.
Start the user workstations and re-select the At Ease Server.

Detailed Instructions =====

Step 1

Shut down all the user workstations except the Administrator workstation, which
should be at the Finder.

Step 2

The At Ease manual suggests that a folder be created on the server and shared as
the At Ease volume, so that all of the At Ease files and student documents will
be in a single folder. However, because of the way ClassWorks looks for its data
files, this should NOT be done. Instead, you need to share the entire hard drive
for both At Ease and ClassWorks.

NOTE: According to EPC, ClassWorks will only look at the root or top level of
the boot or startup volume, so if multiple partitions or hard drives are on the
server the startup volume should be used.

On the server, quit AppleShare File Server and open the AppleShare Admin
application. Select Access Information from the Privileges menu, select the At
Ease folder previously created in the Shared Items box, and click UnShare.

Step 3

Select the startup volume in the Volumes box, click on Share, and move the CW3
user into the User/Group box; select See Files and See Folders for the CW3 user,
and select Change all Enclosed Folders; click Save. In the dialog window that
appears, choose "Inherit" and click on OK.

Step 4

In the Volumes box, double-click the startup volume and repeat the following
steps for the Documents, At Ease Items WG, and ClassWorks 2xxx folders:

- A. Select the folder
- B. Unselect the "Same as Enclosing Folder" box
- C. Select Make Changes for the CW3 user

D. Click on Save

Step 5

Quit AppleShare Admin and open AppleShare File Server.

Step 6

After the file server is running, open At Ease Administration on the Administrator's workstation. You will get a message indicating the server is not setup properly or could not be found. Click OK and enter the name of the startup volume in the window that appears. Change the login information in the lower part of the window to username= CW3, and leave the password field blank; click OK.

Step 7

You will see a couple of messages indicating that the workgroup data volume could not be found, keep clicking OK. Once the main program window opens, go into each Workgroup and change the "Save workgroup data on" option to the server volume listed in the pop-up menu (it should be the <startup volume name>). Click OK and repeat for each workgroup (this assumes you want to store the data on the server).

Step 8

Start each workstation, and after the message appears that the At Ease Server could not be found, click OK, then select the At Ease Server in the window and click OK again.

PowerBook 1400: Video Out Questions & Answers (1/97)

Revised: 1/10/97
Security: Everyone

PowerBook 1400: Video Out Questions & Answers (1/97)

=====

Article Created: 9 January 1997

TOPIC -----

This article contains the following common questions and answers about the video out capabilities and differences of the PowerBook 1400 series computers.

- 1) Does the video out connector insert differently than other PowerBook models?
- 2) Is there a PowerBook Display Control Panel?
- 3) How can I select which monitor I want to be the startup monitor?
- 4) What does the Hide Cursor option do?
- 5) I know how to change the color depth on the PowerBook 1400 series computer's display. Can I change the resolution and color depth on the external monitor using the Monitors & Sound control panel?
- 6) How do I turn on video mirroring? I do not see an option in the Monitors & Sound control panel.
- 7) When I connect the external display and drag the monitor in the icon Monitors & Sound control panel for video mirroring, the PowerBook computer's display has a 1 1/2 inch border around it. Why?

DISCUSSION -----

- 1) Question: Does the video out connector insert differently than other PowerBook models?

Answer: The connector faces in the opposite direction than previous PowerBook computer models. That is, the PowerBook video adaptor cable plugs in facing downwards, unlike previous PowerBook computers on which the PowerBook video adaptor cable plugs in facing upwards.

2) Question: Is there a PowerBook Display Control Panel?

Answer: No, the PowerBook 1400 series computers use the Monitors & Sound Control Panel.

3) Question: How can I select which monitor I want to be the startup monitor?

Answer: There is a checkbox for "identify startup monitor". All you have to do is check the box. There is no more need to hold down the Option key while clicking on the Options button. The Happy Macintosh face is available for dragging if you select the Options button.

4) Question: What does the Hide Cursor option do?

Answer: This option is only available when video mirroring is active. This option is beneficial when showing presentations, or other operations where you want the cursor to be hidden on the big screen. It hides the cursor on the screen which has the menu bar in non-mirroring mode. So if you want the external monitor to not have the cursor, you need to first drag the menu bar to the external monitor, then activate video mirroring, then select hide cursor.

5) Question: I know how to change the color depth on the PowerBook 1400 series computer's display. Can I change the resolution and color depth on the external monitor using the Monitors & Sound control panel?

Answer: When the Monitor & Sound Control Panel is opened a second window opens on the external monitor for the selections for that external monitor.

6) Question: How do I turn on video mirroring? I do not see an option in the Monitors & Sound control panel.

Answer: When a second monitor is recognized by the PowerBook computer the Monitors & Sound control panel will have a fourth button called Arrange. When Arrange is selected a window below shows a icon representing each monitor. When one icon is put on top of the other video mirroring results.

7) Question: When I connect the external display and drag the monitor in the icon Monitors & Sound control panel for video mirroring, the PowerBook computer's display has a 1 1/2 inch border around it. Why?

Answer: What you describe is correct if the external monitor is working at lower resolution than the PowerBook. The PowerBook computer's internal display is reduced (for example, from 800x600) to match the lower resolution (for example, 640x480) of the external monitor.

PowerBook 1400, 200, 2300: Disk Copy Needs Floppy Drive (1/97)

Revised: 1/10/97
Security: Everyone

PowerBook 1400, 200, 2300: Disk Copy Needs Floppy Drive (1/97)

Article Created: 10 January 1997

TOPIC -----

I have a Powerbook 1400 series computer. I need to make some duplicate back up application floppy disks. I tried to make disk images with Apple Disk Copy 4.2, but it tells me that, "This Macintosh cannot use this version of Disk Copy. Certain required support is not provided." What does this mean?

DISCUSSION -----

You are probably getting this message because you have a media bay device in your PowerBook computer other than the Floppy drive media bay. For example, if the CD-ROM media bay is in your PowerBook computer, you need to eject the CD from the bay and close the bay door. Choose Sleep from Special Menu. Remove the CD-ROM media bay from the computer. Insert the Floppy drive media bay into the computer.

The Disk Copy utility program checks for the presence of a floppy drive. If there is not a floppy drive, you get a message that it "will not run on this kind of Macintosh computer since certain required support is not provided." You can get this same message on PowerBook 200 or 2300 series (Duo) computers that do not have a floppy disk drive attached externally or in a docking station.

OT/PPP 1.0: Time Remaining Feature (1/97)

Revised: 1/10/97
Security: Everyone

OT/PPP 1.0: Time Remaining Feature (1/97)

=====

Article Created: 10 January 1997

TOPIC -----

When I sign onto the Internet using Open Transport PPP 1.0 (OT/PPP), I notice that it shows a time remaining. What is this referring to? Is this somehow tapping into the server that I am connected to?

DISCUSSION -----

A PPP server can use a "time remaining" feature to notify a dial-in client how much time remains in the current session. The implementation of this feature (as defined in RFC 1570) is optional and may not be in use by a server you are connected to.

Power Macintosh 7300,7600,8600,9600: New Features (2/97)

Revised: 3/19/97
Security: Everyone

Power Macintosh 7300,7600,8600,9600: New Features (2/97)

Article Created: 13 January 1997
Article Reviewed/Updated: 13 February 1997

TOPIC -----

What are the new features of the Power Macintosh 7300, 7600, 8600, and 9600 computers?

DISCUSSION -----

The table below outlines the primary differences among the Power Macintosh 7500, 7600, 8600, and 9500 computers and the Power Macintosh 7300, 7600, 8600, and 9600 computers. These new features are described in more detail in the sections following the table.

New models	Previous models	Major changes
Power Macintosh 7300/166	Power Macintosh 7500/100	Clock speeds 166-200
Power Macintosh 7300/180		MHz, 256K L2 Cache
Power Macintosh 7300/200		installed, 2 GB hard
		drive, 12X-speed
		CD-ROM drive
Power Macintosh 7600/200	Power Macintosh 7600/120	Clock speed 200 MHz,
	Power Macintosh 7600/132	2 GB hard drive,
		12X-speed CD-ROM
		drive
Power Macintosh 8600/200	Power Macintosh 8500/150	Clock speed 200 MHz,
	Power Macintosh 8500/180	new tower enclosure,
		2 GB AV-capable hard
		drive, 12X-speed
		CD-ROM drive,
		internal Zip
		cartridge drive

Power Macintosh 9600/200	Power Macintosh 9500/200	New tower enclosure, 12X-speed CD-ROM drive, new accelerated display card
Power Macintosh 9600/200MP	Power Macintosh 9500/180MP	Clock speed 200 MHz, dual PPC604e microprocessors, new tower enclosure, 12X-speed CD-ROM drive, new accelerated display card

Summary of Changes

=====

The new features in the faster Power Macintosh 7300, 7600, 8600, and 9600 computers include:

- * PowerPC 604e microprocessor in all models
- * Dual microprocessor configuration (Power Macintosh 9600/200MP)
- * Faster processor speeds, ranging from 166 to 200 MHz
- * Second-level (L2) cache in all models
- * Larger size internal hard disks: 2 or 4 GB
- * AV-capable hard disk (Power Macintosh 8600 only)
- * Built-in 12X-speed CD-ROM drive
- * Built-in Iomega Zip removable cartridge drive (Power Macintosh 8600 only)
- * New accelerated display card (Power Macintosh 9600 only)
- * Security bar on the Power Macintosh 7300 and 7600 models
- * New tower enclosure with easy access and security lock (Power Macintosh 8600 and 9600 models)
- * Mac OS in the new models is Macintosh System 7.5.5

PowerPC 604e Microprocessor

=====

All the new models use the PowerPC 604e microprocessor. The PowerPC 604e is a version of the PowerPC 604 with the following enhancements:

- * On-chip data and instruction caches of 32 KB each
- * Processor clock speed up to 5 times the bus clock speed

Dual Processor Configuration

=====

In the 9600/200MP model, two PowerPC 604e microprocessors are on the processor card. With applications that support the new multiprocessor API, the MP configuration provides up to 2 times the performance of the equivalent single-processor computers. The operation of the dual-processor configuration is asymmetric multiprocessing. One processor is the primary processor: it runs the Mac OS and handles interrupts from the I/O systems. The second processor runs MP tasks as set up by the primary processor.

Processor Clock Speeds

=====

The clock speeds for the microprocessors in the Power Macintosh 7300, 7600, 8600, and 9600 computers are increased over their earlier counterparts. The table below shows the microprocessor clock speeds along with the corresponding processor bus speeds.

Model	Processor clock speed	Processor bus speed
Power Macintosh 7300/166	168 MHz	48.0 MHz
Power Macintosh 7300/180	180 MHz	45.0 MHz
Power Macintosh 7300/200	200 MHz	50.0 MHz
Power Macintosh 7600/200	200 MHz	50.0 MHz
Power Macintosh 8600/200	200 MHz	50.0 MHz
Power Macintosh 9600/200	200 MHz	50.0 MHz
Power Macintosh 9600/200MP	200 MHz	50.0 MHz

Second-Level Cache

=====

All the new models include a second-level (L2) cache. The L2 cache provides a performance improvement of up to 40% over machines without such a cache. The L2 cache in the Power Macintosh 9600/200 and 9600/200MP consists of 512 KB of fast static RAM on the main logic board. The L2 cache in the other models consists of a 256 KB DIMM installed in a slot.

Hard Disk Sizes

=====

The built-in hard disks in the new Power Macintosh computers are either 2 or 4 GB.

AV-Capable Hard Disk

=====

The 2 GB hard disk in the Power Macintosh 8600 can support AV applications. It can transfer video data at 30 frames per second with no dropped frames.

12X-Speed CD-ROM Drive

=====

All the new models include a built-in 12X-speed CD-ROM drive, an AppleCD 1600i. The AppleCD 1600i supports the worldwide standards and specifications for CD-ROM and CD-digital audio discs described in the Sony/Philips Yellow Book and Red Book. The drive can read CD-ROM, CD-ROM XA, CD-I, and PhotoCD discs as well as play standard audio discs. The AppleCD 1600i CD-ROM drive has a sliding tray to hold the disc. The drive features an 12X-speed mechanism that supports sustained data transfer rates of 1600 KB per second and a data buffer that further enhances performance.

Built-in Removable Cartridge Drive

=====

One of the new models, the Power Macintosh 8600, has a built-in Iomega Zip removable cartridge drive. The built-in Zip drive is similar to its external counterpart. The user has the option of placing a system folder on a Zip cartridge and starting up the computer from the Zip drive.

Video Input

=====

The new Power Macintosh 7600 has the same video input capabilities as the Power Macintosh 8500 and 8600 models. The back of the computer has a small panel with RCA jacks for stereo pairs of audio inputs and outputs, an RCA jack for composite video input, and a multipin connector for S-video input.

Accelerated Display Card

=====

The Power Macintosh 9600 includes a video display card that supports acceleration of 2D graphics and text. The display card has 4 MB of buffer memory and cannot be expanded. The display card supports pixel depths of 8, 16, and 24 bits per pixel on small and medium-sized monitors, and 8 and 16 bits on large monitors, as shown in the table below.

=====+=====+=====		
Resolution (pixels)	Vertical frequency (Hz)	Pixel depths (bits per pixel)
=====+=====+=====		
512 by 384	60	8, 16, or 24
-----+-----+-----		
640 by 480	67	8, 16, or 24
-----+-----+-----		
640 by 870	75	8, 16, or 24
-----+-----+-----		
800 by 600	75	8, 16, or 24
-----+-----+-----		
832 by 624	75	8, 16, or 24
-----+-----+-----		
1024 by 768	75	8, 16, or 24
-----+-----+-----		
1152 by 870	75	8, 16, or 24
-----+-----+-----		
1280 by 960	75	8 or 16
-----+-----+-----		
1280 by 1024	75	8 or 16
-----+-----+-----		
1600 by 1200	60, 67, or 75	8 or 16

Security Bar

=====

The Power Macintosh 7300 and 7600 models have a security bar that conceals the latches for the top cover. The security bar snaps into place on the front of the case and is held in place by a screw.

New Tower Enclosure

=====

The new tower enclosure has the following new features:

- * More space for internal storage devices
- * Larger power supply
- * Easier access to internal components
- * Locking feature
- * Space for larger-size DIMMs

Internal Storage Devices

The new tower enclosure has spaces for up to seven internal storage devices. Four of those spaces are accessible from the front; of those four, three can accommodate 5.25-inch devices and one can accommodate a 3.5-inch device. The other spaces are not accessible from the front; they can accommodate three 3.5-inch devices or one 5.25-inch device and one 3.5-inch device.

Larger Power Supply

The power supply in the new tower enclosure now provides a total of 390 watts to support the larger number of drives and the faster processor. The table below shows the maximum power available for additional internal devices such as expansion cards and storage devices. The power supply can support as many as six 15-watt cards or four 25-watt cards.

=====+=====+=====+=====			
Device	Voltage	Current	Power
=====+=====+=====+=====			
Expansion card (15 watts)	+5 V	3 A	15 W
	+-----+-----+-----+-----		
	+12 V	0.5 A	6 W
	+-----+-----+-----+-----		
	-12 V	0.1 A	1.2 W
	+-----+-----+-----+-----		
	+3.3 V	2 A	6.6 W
-----+-----+-----+-----			
Expansion card (25 watts)	+5 V	5 A	25 W
	+-----+-----+-----+-----		
	+12 V	0.5 A	6 W
	+-----+-----+-----+-----		
	-12 V	0.1 A	1.2 W
	+-----+-----+-----+-----		
	+3.3 V	2 A	6.6 W
-----+-----+-----+-----			
Storage devices	+5 V	9 A	45 W
	+-----+-----+-----+-----		
	+12 V	3 A	36 W
	+-----+-----+-----+-----		
	+12 V	7.5 A	--
		peak*	

Access to Internal Components

Two features of the new tower enclosure makes it easier to obtain access to the internal components:

- Removable side panel
- Hinged subchassis

* Removable Side Panel

The entire side panel on the left side of the enclosure is removable. The panel is held in position by a latch with a pushbutton at the top of the enclosure. To remove the side panel takes three steps:

Step 1

Gently tilt the computer onto its right side, as viewed from the front. Small rubber bumpers on the right side act as feet when the computer is on its side.

Step 2

Press down on the button at the top of the side panel and pull the panel away from the enclosure at the top.

Step 3

Pull the side panel to the right (the top of the enclosure) to release it from the bottom of the enclosure, then lift it up and away.

With the side panel out of the way, you have access to the components at the bottom of the computer: PCI expansion slots, the DAV connector, and the space for internal RAID storage devices. Press the button and lift the cover up a few inches.

* Hinged Subchassis

As in earlier Power Macintosh 8500 and 9500 models, access to the DIMM slots is obstructed by the power supply and disk drives. In the new tower enclosure, those components are mounted on a hinged subchassis that can be tilted out of the enclosure.

With the side panel removed, moving the hinged subchassis out of the way takes two steps:

Step 1

Raise the two plastic catches at the top of the open area to release the subchassis. With the computer on its side, and viewed from the front, the catches are at the right of the open space.

Step 2

Grasp the large plastic handle below the catches and slowly lift up, tilting the subchassis to the right. When the subchassis is clear of the internal components, it will rest on its top.

With the computer on its right side, and the subchassis in the open position,

the main logic board with its array of expansion slots is facing up. The user can now insert expansion DIMMs into the appropriate slots.

Locking Feature

The new tower enclosure for the Power Macintosh 8600 and 9600 has a locking feature. A tab on the back of the enclosure connects to an internal latching mechanism for the removable side panel. Pulling out the tab engages the locking mechanism and exposes a hole in the tab. By inserting a security cable or a padlock through the hole, you can secure the tab in the locked position.

Taller RAM DIMM

The method of RAM expansion in the new models is the same as in their earlier counterparts. However, Apple Computer has made the following change to the mechanical specification for the RAM DIMM:

The JEDEC MO-161 specification shows three possible heights for the 8-byte DIMM. All Power Macintosh computers can accommodate DIMMs with the shortest of the three specified heights: 1.100 inches. The new Power Macintosh 8600 and 9600 can also accommodate DIMMs with a height of 1.255 inches.

System Software

=====
The system software has been modified to support the new hardware features. The Mac OS for the new models is a modified version of System 7.5.5 with a new enabler.

Note: The information contained in this article was taken from the Power Macintosh 7300, 7600, 8600, and 9600 Developer Note.

QuickDraw GX and Desktop Printing Issue (1/97)

Revised: 1/24/97
Security: Everyone

QuickDraw GX and Desktop Printing Issue (1/97)

Article Created: 15 January 1997
Article Reviewed/Updated: 24 January 1997

TOPIC -----

I have installed both standard Desktop Printing and QuickDraw GX. After I restart my computer, it is not clear which is running since I see the GX desktop printers as well as the non-GX desktop printers. There is a Desktop Printers menu item in the Apple menu as well. Is it possible for both GX and non-GX desktop printers to be installed, and are they compatible? Also, the Desktop Printer menu item in the Apple menu does not display my GX desktop printers.

One last question, are the printer icons in the menu bar (next to the Balloon Help icon) and the Control Strip related to GX or non-GX Desktop Printing?

DISCUSSION -----

QuickDraw GX desktop printing and non-GX Desktop Printing are NOT compatible. If both are installed and enabled when the system starts, QuickDraw GX desktop printing takes precedence over the non-GX Desktop Printing software. Non-GX Desktop Printing is automatically disabled along with its desktop printers -- an "X" mark will appear through each non-GX desktop printer.

The "Desktop Printer" menu item (if present) in the Apple menu is associated with non-GX Desktop Printing. It will still be displayed even with QuickDraw GX running, but will be non-functional until QuickDraw GX is disabled in the Extensions Manager. As the menu item is in no way associated with QuickDraw GX, GX desktop printers will NOT show up in this menu.

NOTE: The Desktop Printer menu is only installed with printer software and stand-alone Desktop Printer installs. It does not get installed as part of regular system installations. Future versions beyond Desktop Printing v2.0.x will no longer install this menu item.

The printer icons in the menu bar and Control Strip are both part of non-GX Desktop Printing and will only show non-GX desktop printers.

QuickTime for Windows 2.1.x: Error Updating INI Files (1/97)

Revised: 1/15/97
Security: Everyone

QuickTime for Windows 2.1.x: Error Updating INI Files (1/97)

=====

Article Created: 15 January 1997

TOPIC -----

When I try installing QuickTime for Windows 2.1.x (QTW), I get an error message that states "An error occurred while updating ..INI files." when running the QTW 2.1.x installer." How can I correct this?

DISCUSSION -----

When an INI file is larger than 32K bytes, the 16-bit Windows APIs in both Windows 3.1.x and Windows 95, cannot read or write to the INI file. This creates a problem when using the 16-bit Windows APIs, as does QuickTime for Windows, to modify a INI file when it is greater then 32K bytes. However, INI files are text files and you can use the workaround listed below when the INI file is larger than 32K bytes. In this workaround, you will create INI files, which are smaller than 32K bytes, then rejoin the files once you have installed QuickTime for Windows.

Generally INI files are less than 32K. If your INI files are larger than 32K you may have unused or outdated information. The procedure outlined below is the only one we are aware of at this time. Please call Microsoft if you require another method or further explanation.

Workaround
=====

In this example MS Write is used, but you can use any text editor that allows you to create files larger than 32K bytes.

Step 1

Locate the INI files which are 32k bytes or more.

Examples: SYSTEM.INI or WIN.INI

Step 2

Open the SYSTEM.INI or WIN.INI file, using MS Write.

Step 3

PAGE DOWN to about 30 pages.

IMPORTANT:

- The first 30 pages of the SYSTEM.INI file needs to contain the [mci] section.
- The first 30 pages of the WIN.INI, needs to contain the following sections: [Extensions],[mci extensions],[embedding].

Step 4

Hold the SHIFT key while PAGE DOWN through the rest of the file.

Step 5

Cut the selected text.

Step 6

Launch another MS Write document.

Step 7

PASTE into the new MS Write.

Step 8

Save as SYSTEM.QTW

Step 9

Click on the title bar of the first opened Write document. Make sure the selection still there.

Step 10

Delete the section by pressing the DEL key.

Step 11

SAVE AS SYSTEM.INI or WIN.INI

Step 12

Repeat for WIN.INI or SYSTEM.INI if necessary.

Step 13

Run the QuickTime for Windows (QTW) installer.

Once you have installed QTW, you need to re-append the INI files you split.

How to re-append INI files

=====

Step 1

Open the SYSTEM.QTW or WIN.QTW file using MS Write.

Step 2

Choose Select All from the Edit menu.

Step 3

Choose Copy from the Edit menu.

Step 4

Open the SYSTEM.INI or WIN.INI file.

Step 5

Page Down to the end of the file.

Step 6

Choose Paste from the Edit menu.

Step 7

Choose Save from the File menu.

Step 8

Delete SYSTEM.QTW or WIN.QTW

Step 9

Exit and re-enter Windows.

QuickTime for Windows: How to Uninstall W/ Windows 3.1.x (1/97)

Revised: 1/15/97
Security: Everyone

QuickTime for Windows: How to Uninstall W/ Windows 3.1.x (1/97)

Article Created: 15 January 1997

TOPIC -----

How do I uninstall all of the QuickTime for Windows files? I am using Windows 3.1.x.

DISCUSSION -----

Here are the steps you need to uninstall QuickTime for Windows.

Step 1

Find PLAYER.EXE and select it using File Manager.

Step 2

List items by date.

All QuickTime files will cluster around the PLAYER.EXE file.

Step 3

Delete the following:

```
{Windows}\PLAYER.EXE
      \VIEWER.EXE
      \MCENU.HLP
      \PLAYENU.DLL
      \PLAYENU.HLP
      \QTINSTAL.EXE
      \READ_QTW.WRI
      \SAMPLE.MOV
      \VIEWENU.DLL
      \VIEWENU.HLP
```

Step 4

Find ATIVIDEO.QTC and select it.

Step 5

List items by date.

NOTE: All QuickTime files will be write protected, list names with detail and you will see the "r" for write protection.

Step 6

Delete the following files:

```
{Windows}\SYSTEM\*.QTC
      \MCIQTENU.DLL
      \MCIQTW.DRV
      \QTHNDLR.DLL
      \QTIM.DLL
      \QTIMCMGR.DLL
      \QTMOVIE.VBX
      \QTNOTIFY.EXE
      \QTOLE.DLL
      \QTPIC.VBX
      \QTW16.CPL
      \QTWCP.HLP
```

Step 7

Launch Write.exe and open SYSTEM.INI

Note: Removing the following items are not necessary.

- delete this line from the [mci] section in the SYSTEM.INI
QTWVIDEO={Windows' directory}\MCIQTW.DRV
- delete these lines from the [Extensions] section in the WIN.INI
mov={Windows' directory}\player.exe ^.mov
pic={Windows' directory}\viewer.exe ^.pic
- delete these lines from the [mci extensions] section in the WIN.INI
mov=QTWVideo
pic=QTWVideo
jpg=QTWVideo
- delete these lines from the [embedding] section in the WIN.INI
-- PlayerFrameClass=QuickTime Movie, QuickTime Movie,
 {Windows' dir}\Player.exe,picture
-- ViewerFrameClass=QuickTime Picture, QuickTime Picture,
 {Windows' dir}\viewer.exe,picture

Step 8

Delete the QuickTime for Windows Program Group:

- select the QuickTime for Windows group icon delete it.

LaserWriter Select: Japanese Postcard adapter (1/97)

Revised: 1/15/97
Security: Everyone

LaserWriter Select: Japanese Postcard adapter (1/97)

=====

Article Created: 15 January 1997

TOPIC -----

The service price pages for the LaserWriter Select 360 list a Postcard Attachment (part #922-1103). What is this used for?

DISCUSSION -----

In order to meet the requirements for the Japanese market a special adapter was created to support the very small Kansei-Hagaki paper size used for Japanese postcards. The Japanese Postcard Attachment is installed in the envelope cassette tray rear paper support guide. This allows the very short paper size to be fed through the printer properly.

The Postcard Attachment works with these printers:

- LaserWriter Select 300
- LaserWriter Select 310
- LaserWriter Select 360
- LaserWriter Select 610 <-- Only sold in Japan.

Apple Media Tool 2.1.1: Read Me document (1/97)

Revised: 1/15/97
Security: Everyone

Apple Media Tool 2.1.1: Read Me document (1/97)

=====

Article Created: 15 January 1997

TOPIC -----

This article provides the Apple Media Tool 2.1.1 ReadMe file.

DISCUSSION -----

This Read Me file provides the following information about Apple Media Tool 2.1.1:

- Apple Media Tool 2.1.1 CD Disc
- Tips and Hints for Using Apple Media Tool 2.1.1
- Known Problems and Limitations of Apple Media Tool 2.1.1
- Known Problems and Limitations of QuickTime VR
- Interesting Web Sites Related to Apple Media Tool

Apple Media Tool 2.1.1 CD Disc

The Apple Media Tool 2.1.1 CD-ROM is a hybrid disc that you can use on Mac OS-based and Windows-based computers. On a Mac OS-based computer, you can see all the folders and files on the CD, including the Windows files.

On a Windows-based computer, you can see these two folders and their contents:

- AMT_PROJ contains Windows versions of the Apple Media Tool demonstration projects.
- AMT_UTIL contains files that allow you to install QuickTime for Windows 2.1.2 and other related AMT files from the CD.

Tips and Hints for Using Apple Media Tool 2.1.1

Here are some tips and hints for using Apple Media Tool that will help you be more productive.

- Because Apple Media Tool requires software in specific locations on your hard disk, you should use the Installer program provided on the Apple Media Tool 2.1.1 CD to install the software.
- If you move your project from one disk to another, choose Check All from the Media menu before you run the project to make sure that Apple Media Tool can locate the media for the project.
- Before your project executes the Open URL command, be sure that an Internet browser program, such as Netscape Navigator, is open and a connection to the Internet is established. You can use the Application Launcher object and the Launch command to open the program. Many Internet browser programs open a connection to the Internet automatically, if configured to do so.
- Experienced Apple Media Tool developers find it useful to increase the amount of memory the program uses while they are designing and prototyping their projects. Doing so can speed up development by improving the performance of Apple Media Tool. You can adjust the memory required by your project later. To increase the amount of memory Apple Media Tool uses, select the program's icon in the Finder and choose Get Info from the File menu. In the Get Info window that appears, change the "Preferred size" setting, then close the window.
- To link two screens that are not linked in the Map window, hold down the Control key, then drag the screen you are linking to from the Screens pane to the Link command in the Actions pane of the Browser miniwindow.
- Because ambient sounds can continue to play while screens change, you do not place the media for an ambient sound as an object in a screen. Instead, create an object with an event and Ambient Sound command to play the sound, then drag the sound media from the Media miniwindow to the Ambient Sound command. (The media for an Ambient Sound command must be a .WAV file.)
- You cannot use the same hot text more than once to execute different actions in a single RTF file.
- Because a hot spot region defines a region of the object, not the media, be cautious using hot spot regions in Picture objects that scroll--Picture View and Picture Scroller objects--or if you use the Switch Media command to change the media displayed in an object.
- Depending on the size of the media and the way you use a Picture View object, your title can require a lot of memory to display the screens containing the Picture View object.

Known Problems and Limitations of Apple Media Tool 2.1.1

- If you use the Text Field object's Save File Name feature, do not include an apostrophe (') character in the file name.
- If you modify an RTF file which is used as media in a project, you will need to save the changes and then choose Replace from the Media menu to add the new

file to your project.

- To use the Text Field object's Save File Name feature in a title that plays on Windows-based computers, the file name you specify must conform to the DOS file name format. Therefore, the name you enter in the Save File Name box must be 8 characters or less, followed by a period and a 3 character suffix, such as "TXT."

- If you use the Application Launcher object and the Launch command to launch one or more titles from another title, all of the titles in the sequence must be in the same folder. If these titles are compiled to play on Windows-based computers, each title consists of four separate files, including a .DLL file. By default, Runtime Maker names a .DLL file KEY.DLL. However, because all the .DLL files for a sequence of titles must be in the same folder, you need to give each .DLL file for each title a unique name. For each title you must then change the [DLL] section of the .INI file to correspond to the new name of that title's .DLL file. To do so, follow these steps:

1. Open the .INI file and find the [DLL] section.
2. Find the line that reads ";DLL name=key.dll."
3. Delete the ";" character.
4. Change "key" to the name you assigned to that title's .DLL file.

- From within an AppleScript script, the 'Quit' command will not work.

Known Problems and Limitations of QuickTime VR

- You cannot print the contents of a QuickTime VR movie object from a title using the Print command.

- A QuickTime VR movie is always the front-most object in the screen, regardless of the order in which it appears in the Objects pane in the Browser miniwindow.

- You cannot use Apple Media Tool Converter to convert a QuickTime VR movie to one that plays on both Mac OS-based and Windows-based computers. If you attempt to do this, a message appears saying that you must use a QuickTime VR editing tool to create a cross-platform movie. You can use QTVRPlayer to convert the movie. QTVRPlayer is located in the Utilites folder on the Apple Media Tool 2.1.1 CD.

- To play a title that includes a QuickTime VR movie on a Windows-based computer, you must install certain QuickTime VR software on the computer. To do so, copy the QTVRW.QTC file into either the same folder as the title or the WINDOWS folder. On a Windows-based computer, this file is in the QTVRW.QTC folder in the AMT_UTIL folder on the CD. On a Mac OS-based computer, it is in the QTVRW.QTC folder in the Windows Files folder in the Utilities folder on the CD.

- A QuickTime VR movie requires most of a computer's processing time when it is playing. Therefore, a title cannot execute effect transitions, play sounds, or play other movies when it is playing a QuickTime VR movie. A QuickTime VR movie is playing any time the pointer is within the object that contains the movie.

- Although you can change the size of an Object Movie or Panoramic Movie object in the Display window, when you run the project or play the title the movie appears at the size specified for the movie in the QuickTime VR editor. To change the size of a movie, you must use a QuickTime VR editor.

Apple Media Tool 2.0: Creating Transparent Colors (1/97)

Revised: 1/15/97
Security: Everyone

Apple Media Tool 2.0: Creating Transparent Colors (1/97)

=====

Article Created: 15 January 1997

TOPIC -----

I created a new project in Apple Media Tool 2.0 (AMT) that has color preferences set to:

- 1) millions
- 2) 256
- 3) Thousands

One of my pict files has a dark gray (RGB=8,8,8) background which I made transparent. When I view the project in thousands of colors, the background is transparent, as I expect. But when I play the project on a machine that only supports 256 colors, the background is no longer transparent. How can I fix this?

DISCUSSION -----

Apple Media Tool does not handle transparency well when changing color depths. Here are some recommendations on how you can avoid the problem:

- Keep it Simple. Stick to white or black as a transparent color. Never use 16- or 24-bit transparent colors.
- Do as much as possible with QuickTime background stills. QuickTime does a good job of dithering images down to 256 color palettes on Macintosh and Window computers.
- Use Equilibrium's DeBabelizer Toolbox software to create superpalettes that play on Macintosh and Window computers, then make a QuickTime Pict from the result.
- Test extensively on both Macintosh and Window computers using a wide variety of video boards.

Mac OS 7.6: Correct Version of MacsBug to Use (3/97)

Revised: 3/3/97
Security: Everyone

Mac OS 7.6: Correct Version of MacsBug to Use (3/97)

=====

Article Created: 4 February 1997

TOPIC -----

In the About Mac OS 7.6 Read Me file it states that I need to upgrade to version 6.5.4 of MacsBug. I know people using version 6.5.3 of MacsBug and it works properly for them. Do I really need a new version of MacsBug?

DISCUSSION -----

Certain PCI-Based Mac OS computers using Mac OS 7.6 are not compatible with MacsBug v6.5.3 or earlier. On these computers the display turns a solid shade of gray, or the text is yellow when you enter MacsBug.

Note:

MacsBug is a developer tool, and is not required to use Mac OS 7.6.

MacsBug 6.5.4

=====

MacsBug v6.5.4 is not completed as of the writing of this article. If you are experiencing the problem described above with MacsBug, you can install an alpha version of this software, version 6.5.4a1. It is posted to Apple's Developer World ftp site in the following location:

ftp://ftp.apple.com/devworld/Tool_Chest/Testing_-_Debugging/Debuggers_-_dcmds/MacsBug_6.5.4a1.sit.hqx

If you are not experiencing problems with MacsBug and Mac OS 7.6, then you do not need to install MacsBug 6.5.4a1.

This article appeared in the 4 February 1997 issue of the Information Alley.

PCI-Based Macintosh Computers: Won't Mount CD-ROM (4/97)

Revised: 4/14/97
Security: Everyone

PCI-Based Macintosh Computers: Won't Mount CD-ROM (4/97)

=====

Article Created: 16 January 1997
Article Reviewed/Updated: 14 April 1997

TOPIC -----

After performing a "clean install" of the system software on my Power Macintosh 8500 computer with version 3.0 of the 7.5.3 System Software CD, I cannot get the computer to mount any compact discs. However, I can startup the computer using the System Software CD. I have tried troubleshooting both the software and hardware, but have not been able to correct this.

DISCUSSION -----

You may have the incorrect version of the System software CD for your computer.

Note:

This issue may occur on any of the newer PCI-based Power Macintosh computers including the Power Macintosh 7600, 8500, and 9500.

Verification

=====

Here is how you can verify you were shipped the incorrect System Software CD.

- 1) Check the version number of the 7.5.3 System Software CD. Is it version 3.0?
- 2) Check the version number of the Apple CD-ROM extension in the Extensions folder. Is it version 5.1.2?
- 3) Can you startup your Power Macintosh computer from the System Software CD?
- 4) When you startup from your hard disk and have version 3.0 of the 7.5.3 System Software CD in the CD-ROM drive, do you get a -50 error dialog when ejecting the CD? (Either using the Put Away command or dragging the icon to the Trash).

If you answered yes to these questions, then you were shipped the wrong System

Software CD.

Background

=====

The 3.0 version of the 7.5.3 System Software CD installs version 5.1.2 of CD-ROM Setup software, which does not support the 8x-speed CD-ROM drive in the newer PCI-Based Power Macintosh computers. When the computer starts-up from the hard drive with the incorrect CD in the CD-ROM drive, the older driver loads causing the -50 error when trying to eject the disk. The Tech Info Library article titled "PCI-Based Power Macintosh: -50 Error When Ejecting CD" (TECHINFO-0019271) contains additional information on this issue.

Correcting this Issue

=====

In order to use your CD-ROM drive, you need CD-ROM Setup v5.1.7. This version of the CD-ROM Setup supports 8x-speed CD-ROM drives and it is available through online services. If you do not have access to Apple's online software update libraries, check with your local Apple service provider, or call the Apple support line.

Revised: 1/23/97
Security: Everyone

About Mac OS 7.6 Read Me (1/97)

Article Created: 16 January 1997

TOPIC -----

This article is the About Mac OS 7.6 ReadMe file.

DISCUSSION -----

About Mac OS 7.6

This document provides information about improvements you'll find in Mac OS 7.6, supplementing the information in your installation manual. This document also contains information about known problems with this release and possible solutions.

Mac OS 7.6 includes the following new features and improvements:

- Performance improvements when using virtual memory
- Performance is faster than previous versions of virtual memory when you
- open a large application program that requires a significant amount of RAM
 - switch between large application programs
 - switch between large documents within an application
 - access SCSI devices

The amount of improvement will vary depending on the amount of RAM installed, the amount of virtual memory allocated, and the applications being used.

Virtual memory is automatically turned on when you install Mac OS 7.6. If you have less than 16 MB of built-in memory, do not turn virtual memory off or you may experience problems.

- Volume buttons on 5200, 5300, 6200, 6300, and 630 series computers
- Problems with the volume buttons on the front of your computer have been fixed.
- Support for multiprocessor cards on computers with PowerPC microprocessors

You can install cards with additional processors to increase speed and performance when using applications that take advantage of multiprocessor technology.

- WorldScript Power Adapter provides performance and stability enhancements on computers with PowerPC microprocessors

Computers that use languages based on the Roman alphabet (French and English, for example) also benefit from the improvements provided by WorldScript.

- Computers with 68040 microprocessors and computers with PowerPC processors that use the NuBus expansion bus can use large disks

These computers can now use disks larger than 4 gigabytes, up to a maximum of 2 terabytes. On 68040 computers, large disks cannot be used as startup disks, and cannot contribute to virtual memory totals.

- Enhanced screen capture options

You can copy portions of the screen, and copy the screen images to the Clipboard or a file. Use the following keyboard combinations:

- Command-Shift-Control-3 copies a picture of the entire desktop to the Clipboard.
- Command-Shift-4 creates a picture file of a rectangular selection of the desktop. After pressing and releasing the key combination, position the cursor at the upper-left corner of the area you want to capture, then drag to the lower-right corner. If you continue to press the Shift key while dragging the cursor, the capture area will be constrained to a square.
- Command-Shift-4-Caps Lock creates a picture file of a window. After pressing the key combination, click the window you want to capture.

To save the rectangle or window on the Clipboard instead of as a file, press the Control key as you click. To cancel a Command-Shift-4 screen selection, press the Space bar.

- Compatibility problem fixed

Mac OS 7.6 fixes a problem in system software versions 7.5.3 and 7.5.5 in which the system took some of an application's memory, which occasionally caused compatibility problems.

- Fewer out of memory messages when using the Finder

The Finder has more memory allocated to it, which should reduce error messages and reduce conflicts with certain extensions.

- Improved data integrity

Mac OS 7.6 will save information stored in the disk cache more often, which reduces the chance of a crash causing disk corruption.

- Improved Resource Manager

Resource Manager performance has been improved. Since both system software and applications use the Resource Manager, overall performance is enhanced.

- Shorter startup time

Input devices are no longer reinitialized during startup.

- Virtual memory uses less system RAM

More RAM is now available for applications.

- OpenDoc performance improved

A commonly-used memory allocation routine was made twice as fast as it was previously, resulting in faster OpenDoc performance.

- The Modern Memory Manager is always on

The Modern Memory Manager, used on computers with PowerPC processors, cannot be turned off in the Memory control panel.

You will also notice these improvements, first provided in the 7.5.5 System Update:

- Improved memory management on PowerPC computers

If you could not open an application program in a low-memory situation, you may be able to use the application after you install this software.

- Improved floppy disks reliability in computers with a DOS Compatibility Card
Problems inserting floppy disks while Windows is starting up have been fixed.

- Improved reliability on PowerBook 5300 and 2300 series computers and Macintosh 5400, 6400, 7200, 7500, 7600, 8500, and 9500 series computers

If you have a PowerPC PowerBook or a PCI-based computer, your computer may have "frozen" from time to time while accessing the hard disk. This release fixes one cause of this problem.

- Improved reliability when using Ethernet and virtual memory

Transferring large files over Ethernet with virtual memory turned on is more reliable.

- Improved reliability when using the Apple TV Tuner or Macintosh TV Remote Control

The channel and volume buttons on the remote control now work when pressed rapidly.

- Improvements in LocalTalk

LocalTalk now works more reliably on Macintosh 5400 series computers and performs better when using some infrared software products.

- Improved stability with multiple background application programs

This release fixes a problem that caused a crash when using more than one background program. (A background program is one that works behind the scenes, so you don't see it in the Application menu. Some e-mail programs have this background feature.)

- Improved stability when using a shared printer on a network

The computer will no longer crash when using a shared printer on a network.

- Improved reliability on computers with PowerPC 604 or 604e processors that run at 180 MHz or greater

These computers are less likely to freeze during startup or experience problems

when formatting floppy disks.

- Improved reliability using Ethernet on Macintosh 5400 and 6400 series computers
- Improved reliability using sound-intensive applications on Macintosh Quadra and Centris computers with the PowerPC upgrade card

Known problems and compatibility issues

- PowerTalk is not compatible with Mac OS 7.6

PowerTalk mail, catalogs, the keychain, and other PowerTalk services are not available with Mac OS 7.6. See the Mac OS 7.6 installation manual for more information.

- OpenDoc, Cyberdog, and LaserWriter 8.4 are not installed on computers with 68030 and 68040 microprocessors

OpenDoc, Cyberdog, and the LaserWriter 8.4 driver use a common piece of software called the CFM 68K Runtime Enabler. Apple has discovered a problem with the CFM 68K Runtime Enabler and is not including it with Mac OS 7.6. You cannot install OpenDoc, Cyberdog, and the LaserWriter 8.4 driver on computers with 68030 and 68040 microprocessors. Additionally, other application programs that use the CFM 68K Runtime Enabler will not work on computers with 68030 or 68040 processors and Mac OS 7.6. Other Apple products that use the CFM 68K Runtime Enabler include Apple Telecom software, version 3.0 and later, and the Apple Media Tool.

- Select a printer driver even if you don't have a printer connected

If you don't have a printer connected, either locally or over a network, you should still select a printer driver in the Chooser. To select a printer driver, open the Apple () menu and choose Chooser. Click a type of printer (for example, LaserWriter 8) in the box on the left side of the Chooser. If you don't select a driver, you could experience problems.

- Using AppleVision software on computers with 68040 processors and on computers with PowerPC processors that use the NuBus expansion bus after a clean installation of Mac OS 7.6

Computers with 68040 processors and computers with PowerPC processors that use the NuBus expansion bus use AppleVision software version 1.0.2. If you do a clean installation of Mac OS 7.6, version 1.0.4 of the AppleVision software is installed. (If you do a normal installation, your AppleVision software is not touched, and you retain version 1.0.2.) AppleVision software version 1.0.4 was not meant for computers with 68040 processors or computers that use the NuBus expansion bus. You can still use your computer and monitor with version 1.0.4, but you won't be able to use all of your monitor's features. To regain all the features of your monitor software, reinstall your AppleVision software from its original disks.

- PowerBook 190, 190cs and 5300cs

The PowerBook 190cs and 5300cs display may appear blank upon the first restart after installing Mac OS 7.6, as well as every time after resetting PRAM. This is because the power manager is being updated on the PowerBook. Restarting the PowerBook once more will result in a normal screen. To shut the PowerBook down

safely, press the power button one time (which brings up the shutdown dialog) and then press return.

- Power Macintosh Upgrade Card users cannot use LaserWriter driver 8.4 in 68040 mode

LaserWriter driver version 8.4, installed on PowerPC computers, will not work on computers with 68040 microprocessors. If you have a Power Macintosh Upgrade Card and switch between PowerPC and 68040 modes, you will not be able to print in 68040 mode unless you install LaserWriter driver version 8.3.4 instead of version 8.4. You can install this LaserWriter version by installing a universal system on your computer. (The universal system is a custom installation option.)

Some features in LaserWriter version 8.4 are not available in version 8.3.4. In LaserWriter 8.3.4, you cannot print a PostScript file by dragging it to a desktop printer icon; you must use the Apple Printer Utility or the LaserWriter Utility. (One of these programs was included on the disks that came with your printer.) Also, in LaserWriter 8.3.4, you set up printers in the Chooser, not in the Printing menu.

- Printing with QuickDraw GX while using Cyberdog

Printing is not available with QuickDraw GX while using Cyberdog (both QuickDraw GX and Cyberdog are available with Mac OS 7.6). To work around this problem, save e-mail messages and other Cyberdog files as text, then print them using another application.

- Color OneScanner driver will not work with Virtual Memory turned on

If you are using an Apple Color OneScanner with Scanner extension version 4.1 or earlier, you need to turn VM off. Apple will have a new scanner driver available to address this problem as soon as possible.

- Macintosh Tutorial Part 1 will not work on computers with 68030 or 68040 processors

Part 1 of the Macintosh Tutorial, version 1.2 will not work on computers with 68030 or 68040 processors and Mac OS 7.6. Part 2 of the Macintosh Tutorial will work normally.

- PC Compatibility software and Mac OS 7.6

Mac OS 7.6 does not include PC Compatibility software. If you perform a clean installation of Mac OS 7.6, you will need to reinstall PC compatibility software.

- Apple Telecom software and Mac OS 7.6

Mac OS 7.6 does not include Apple Telecom software. If you perform a clean installation of Mac OS 7.6, you will need to reinstall Apple Telecom software.

- Apple CD-ROM and non-Apple CD-ROM incompatibilities

If your computer or CD-ROM drive is not manufactured by Apple, or you have an Apple CD-ROM drive which has been updated with a non-Apple driver, incompatibilities may result. To permit your CD-ROM drive to function correctly, remove "Apple CD-ROM" from the Extensions Folder, and reinstall the software to support your CD-ROM device.

- Macintosh Easy Open control panel renamed "Mac OS Easy Open" control panel
Some software, including PC Compatibility software versions 1.5 and earlier, installs the Macintosh Easy Open control panel. If you install software that includes the Macintosh Easy Open control panel, remove it and use the Mac OS Easy Open control panel which is installed with Mac OS 7.6.

- Network Software Installer version 1.5.1 installs older version of AppleTalk
The Network Software Installer installs an earlier version of AppleTalk than the one included with Mac OS 7.6. If an earlier AppleTalk version is installed, Open Transport networking software will not work. Do not use the Network Software Installer after installing Mac OS 7.6.

- QuickTake 150 software installs old version of QuickTime PowerPlug
Mac OS 7.6 includes QuickTime PowerPlug version 2.5 for computers with PowerPC microprocessors. The QuickTake 150 installer replaces this with version 2.0. Remove the QuickTime PowerPlug file from your Extensions folder (inside the System Folder) before installing QuickTake 150 software. After the QuickTake software is installed, drag the PowerPlug file back to the Extensions folder.

- Switching between a LocalTalk network and a serial printer
If you use the same port to alternately connect to a LocalTalk network and a serial printer, the port is not always correctly released after you turn off AppleTalk to use the printer. If you have trouble printing after turning AppleTalk off, restart the computer.

- Using the QuickDraw GX Installer when Adobe Acrobat is installed
If you use the QuickDraw GX Installer to either install or remove QuickDraw GX and your computer has Adobe Acrobat installed, Acrobat will display a message about missing fonts each time the computer is restarted. Reinstall or turn off Acrobat to stop the warning message. (Turning off QuickDraw GX in the Extensions Manager will not solve the problem.)

- Using Open Transport PPP with other versions of PPP
If you use other versions of PPP (such as MacPPP), settings for each control panel must be updated separately. If an application (such as the Dialer application included with the Apple Internet Connection Kit) makes changes to one control panel, the other must be updated manually. The Apple Internet Connection Kit Dialer will only work with MacPPP.

- Quadra owners with a PowerPC Upgrade Card
The Drive Setup disk utility does not work with your upgrade card. You can use HD SC Setup to update your driver or initialize a disk, but you need to turn off the PowerPC upgrade card before using HD SC Setup. If you need to start up your computer from a Disk Tools floppy disk, either turn off the upgrade card and use the Disk Tools 1 disk, or make a copy of the Disk Tools 2 disk and replace Drive Setup with HD SC Setup. Then start up your computer with the new Disk Tools 2 you just created.

- Apple HD SC Setup should not be used to update the driver after using Drive Setup
Once a hard drive has been initialized with Drive Setup, do not update the driver with HD SC Setup.

- OpenDoc ODFLibrary and non-Apple installers

Some non-Apple applications and OpenDoc part editors require a later version of the OpenDoc ODFLibrary than the one installed with Mac OS 7.6. In some cases the installers for these products may not replace the older version of ODFLibrary with the newer version they require. If a newly-installed OpenDoc product doesn't work, remove the ODFLibrary file from the Editors folder inside the System Folder, then reinstall the product. This should cause the product's installer to install the correct ODFLibrary. If the product still fails to work, contact the manufacturer.

- Apple Menu Options, General Controls, and Views control panels restored to default values

These control panels are restored to their default values after installing Mac OS 7.6. If you have made changes to either of these control panels, you will need to restore your settings. The Empty Trash warning is also turned back on.

- Macintosh Guide has been renamed "Mac OS Guide"

This change appears in the Guide (question mark) menu when the Finder and Energy Saver control panel are active, but not when some other control panels are active. All instances of Macintosh Guide will be renamed in a future release.

- Aliases in Extensions Manager

The Extensions Manager control panel does not display aliases. If you have aliases in the Startup Items folder or the Shutdown Items folder, you can't turn off those items using the Extensions Manager.

- Using Assistant Toolbox with desktop computers

If you use the Assistant Toolbox extension (for portable computers) on a desktop computer, the contents of your RAM disk will be lost when you shut down your computer. Apple is working on a solution to this problem.

- Apple System Profiler program displays incomplete information

With the exception of internal ATA hard disks, Apple System Profiler does not display information about non-SCSI devices, including PC Cards, ATA devices, and ATAPI devices.

- Using Desktop Shortcut feature of Aladdin Desktop Tools with Mac OS 7.6

With Shortcut, when you are in an Open or Save dialog box, you should be able to click any Finder window and see that window's contents in the Open or Save dialog box's scrolling list. This feature does not work with Mac OS 7.6. Aladdin Systems expects to release an update to address the issue.

- Using MacsBug and Mac OS 7.6

Mac OS 7.6 requires MacsBug version 6.5.4. (MacsBug is a tool for software developers.) For information, check the Apple developer Web site at <http://devworld.apple.com>.

Advanced users can find additional technical information in the Mac OS 7.6 Tech Note document. This document is located on the World Wide Web at <http://devworld.apple.com/dev/technotes.shtml>.

PowerBook 1400: Not Recognizing Added Memory (1/97)

Revised: 1/16/97
Security: Everyone

PowerBook 1400: Not Recognizing Added Memory (1/97)

=====

Article Created: 16 January 1997

TOPIC -----

I installed additional memory (RAM) into my PowerBook 1400 series computer, but it is not recognizing it, that is, it does not show up in the About This Macintosh or I see a "failing built in memory test" message at startup. What is wrong?

DISCUSSION -----

This type of symptom has been reported to Apple by some customers who have added memory to the user expandable memory slot in their PowerBook 1400 series computers.

Apple has worked closely with developers of third-party (non-Apple) memory upgrades and have identified timing issues between the added RAM and the Power 1400 series computers. Many of these third party memory vendors are now modifying their cards to allow for proper signal timing.

Customers that have added third-party memory upgrades that are not being recognized, or that report memory errors, should contact the vendor of the memory upgrade.

AICK and Telecom 3.0 Connect Speed Issue (1/97)

Revised: 1/16/97
Security: Everyone

AICK and Telecom 3.0 Connect Speed Issue (1/97)

Article Created: 16 January 1997

TOPIC -----

When configuring the Internet Dialer, the port speed setting for a GeoPort defaults to 14.4 kbps. If I'm running Apple Telecom 3.x or the Express Modem 3.x update, why do I not get connect speeds greater than 14.4 kbps? I think that I should set this to 115k or at least 57k. With v.34/.42 protocols, I would want the port speed to be higher than the connect speed to take advantage of compression.

Also, will this setting really have an affect on the speed I will see. When I connected to the AICK (Apple Internet Connection Kit) registration server, I got a connect speed of 28.8 kbps. Why is it connecting at 28.8 kbps speeds when the port appears to be set for 14.4 kbps? That should not happen should it? I have not checked the default settings but I thought connect speed would be dependent on port speed.

DISCUSSION -----

The serial port speed setting determines the communication speed between the serial port and the modem and, in order to take advantage of the full bandwidth of your modem connection that's using compression, your port speed should be set higher than the expected speed from modem to modem. However, the GeoPort modem isn't really using the serial port in the same way. If you read page 115 of the Express/Fax Modem manual that came with the GTAK I it states:

"Traditional modems-external modems or even modems that plug into a slot on a main logic board-use an RS-232-like serial connection protocol between the CPU (Data Terminal Equipment-DTE) and the modem (Data Communications Equipment-DCE). Your modem does not use this type of serial connection.

Since your modem has no DTE-DCE serial interface, commands related to the serial interface have no effect, but still exist for script compatibility reasons."

The fact that the other modems may set the serial port speed to 57.6 kbps indicates to me that the AICK team just chose that modem speed to put there.

On why the modems connect at higher than 14.4 kbps anyway. By default, modems will attempt to connect at the highest speed they are capable of (providing the other end can support the same speed). Therefore, even if the port speed is set to 14.4 kbps, the modem is still negotiating V.34 protocols. However, as you point out, it is desirable to have your serial port speed higher than your modem speed to take advantage of the compression (for traditional style modems).

PC Compatibility Card: Support For 32-Bit Network Drivers (1/97)

Revised: 1/16/97
Security: Everyone

PC Compatibility Card: Support For 32-Bit Network Drivers (1/97)

=====

Article Created: 16 January 1997

TOPIC -----

Are there any inherent hardware limitations of the Apple Macintosh PC Compatibility cards which would prevent use of a true 32-bit network driver, once one is written to work with the PC Compatible?

DISCUSSION -----

There is not a technical reason why a true 32-bit network driver would not work, once such a driver is written specifically for the Apple PC Compatibility Cards.

At the current time, the drivers enclosed with the Apple PC Compatibility Cards such as MacNDIS and MacODI are both 16-bit real mode drivers.

Performa 6320: SoundLib In Extensions Folder Not Needed (1/97)

Revised: 1/17/97
Security: Everyone

Performa 6320: SoundLib In Extensions Folder Not Needed (1/97)

=====

Article Created: 13 January 1997

TOPIC -----

I have a Macintosh Performa 6320 computer. After using my computer for a few weeks, the sound no longer worked. My menu bar flashed, but I did not hear any sound. I checked my Extensions folder and I noticed a file called "SoundLib". After removing this file from my System Folder and restarting, I was able to restore sound on my computer. Do I need this in my System Folder or can I delete it permanently?

DISCUSSION -----

Owners of Macintosh Performa 6320 computers should delete this SoundLib file from the Extensions folder. However, any time you "Restore System Software" or "Restore all Software" from the Performa CD, it will be reinstalled, so you need to remove this file again.

The SoundLib file is used only for development and is not needed by any of the third party or Apple Computer software applications included with your Macintosh Performa computer. This SoundLib file is harmless and will not cause any data loss or crashes.

Mac OS 7.6 Spelling Error (1/97)

Revised: 1/23/97
Security: Everyone

Mac OS 7.6 Spelling Error (1/97)

=====

Article Created: 17 January 1997

TOPIC -----

This article describes a spelling error found in the Extensions Manager control panel.

After I installed System 7.6, opened the Extensions Manager control panel, and viewed by package; I found a "System Software 7.6" package and a "System Software 7.6" package. The "t" was missing from one of the package names.

DISCUSSION -----

This is a known issue, and it was found too late for changes to be made. It will be fixed in the next system software update. The package name comes from one of the 'vers' resources. This spelling error affects these five files:

Apple Ethernet CF
Apple Ethernet LC
Apple Ethernet NB
Apple Built-in Ethernet
Apple TokenRing NB

Mac OS 7.6: AppleShare 3.6.4 Required For Net Install (1/97)

Revised: 4/21/97
Security: Everyone

Mac OS 7.6: AppleShare 3.6.4 Required For Net Install (1/97)

=====

Article Created: 17 January 1997

TOPIC -----

What version of AppleShare Workstation software must a client have installed when installing MacOS 7.6 from a file server?

DISCUSSION -----

You must have AppleShare Workstation software version 3.6.4 installed before starting a network installation of Mac OS 7.6.

If you have AppleShare Workstation software version 3.6, 3.6.1, or 3.6.2, you need to upgrade to version 3.6.4 before you can install Mac OS 7.6 over a network. This software is provided in the Utilities folder on the Mac OS 7.6 CD-ROM disc. Install this version of AppleShare before proceeding with the Mac OS 7.6 installation.

Mac OS 7.6: AppleShare Workstation Version Issue (1/97)

Revised: 1/20/97
Security: Everyone

Mac OS 7.6: AppleShare Workstation Version Issue (1/97)

=====

Article Created: 17 January 1997

TOPIC -----

I installed AppleShare Workstation software version 3.6.4 on my system, however when I select a file server from the Chooser, the version that shows up in the login dialog box says v 3.6.3. What version of AppleShare Workstation software do I have installed?

DISCUSSION -----

You have version 3.6.4 installed, the file server login dialog box contains a typographical error. If you choose Get Info in the File menu on the file AppleShare in your Extensions folder, you will see the correct software version number.

PowerBook 1400: External Displays & Resolutions Supported (1/97)

Article Created: 17 January 1997

TOPIC -----

What resolutions are supported by the optional external video card (M4509LL/A) available for the PowerBook 1400 series computers?

DISCUSSION -----

External Video Support Matrix

Display	Resolution(HxV)	Bits/Pixel
-----	-----	-----
12-in. RGB Display	512x384	1-8bpp
12-in. Monochrome Display	640x480	1-8bpp
13/14-in. RGB Display	640x480	1-8bpp
VGA (60 Hz)	640x480	1-8bpp
SuperVGA (56 Hz)	800x600	1-8bpp*
VESA 1024x768 (60 Hz)	1024x768	1-4bpp*
Portrait Display	640x870	1-4bpp
Portrait Display	640x818	1-8bpp
15-in. RGB Display	640x870	1-4bpp
15-in. RGB Display	640x818	1-8bpp
16-in. RGB Display	832x624	1-8bpp
Apple 14" Multiple Scan	512x384	1-8bpp
	640x480	1-8bpp
	832x624*	1-8bpp
Apple 17" Multiple Scan	640x480	1-8bpp
	832x624*	1-8bpp

Apple 20" Multiple Scan	640x480	1-8bpp
	832x624*	1-8bpp

* SuperVGA is accessed as a "family mode" option of VGA. To use SuperVGA, you have to use the Monitors control panel when connected to a VGA display capable of doing both VGA and SuperVGA timings.

Power Macintosh 4400/200: Description (2/97)

Revised: 2/13/97
Security: Everyone

Power Macintosh 4400/200: Description (2/97)

=====

Article Created: 19 January 1997
Article Reviewed/Updated: 13 February 1997

TOPIC -----

This article contains a description of the Power Macintosh 4400/200 series computers.

DISCUSSION -----

The Power Macintosh 4400/200 computer combines high performance with a streamlined, cost-effective design that takes advantage of industry-standard parts to give you Power Macintosh capabilities at a highly economical price. It's an ideal system for small and medium-size businesses, for home offices, and for running productivity applications in organizations of any size.

Based on advanced RISC technology, the Power Macintosh 4400/200 computer provides the two key features that most organizations are looking for in a Macintosh: the speed of the PowerPC processor and the flexibility of the Peripheral Component Interconnect (PCI) expansion architecture. More specifically, for high-performance computing, it offers a fast 200-megahertz PowerPC 603e processor. For expansion, it includes two industry-standard PCI slots that make it easy--and relatively inexpensive--to customize the system to provide additional capabilities that can meet your needs more precisely. In fact, if you want to use your Power Macintosh 4400/200 to run not only the Mac OS, but also MS-DOS and Windows applications, you can simply install a PC Compatibility Card from Apple in one of the system's PCI slots.

With networking and Internet use becoming increasingly important to most individuals and organizations, you'll be glad to know that the Power Macintosh 4400/200 has both bases covered. The Power Macintosh 4400/200 includes built-in LocalTalk networking capabilities, and some configurations include built-in Ethernet and all of the software tools needed to access the Internet. Other configurations can be configured for high-speed Internet access by installing an optional Ethernet or modem card.

So whether you need power and expandability for everyday number crunching, office productivity, or an innovative multimedia project--or want a fast, easy way to get started with the Internet--the Power Macintosh 4400/200 offers the features you need at an affordable price.

Features

=====

High performance

- * 200-MHz PowerPC 603e processor
- * Built-in floating-point processor and 32K internal cache
- * 256K level 2 cache (included with some configurations)
- * Built-in 2-D graphics acceleration

Communications and multimedia

- * 10BASE-T Ethernet port (included with some configurations)
- * Two high-speed serial ports compatible with GeoPort devices and LocalTalk cables
- * 8x- or 12x-speed CD-ROM drive (depending on configuration)
- * 16-bit stereo audio input and output

Expandability

- * Two industry-standard PCI expansion slots (one 12-inch and one 7-inch)
- * SCSI connector for hard disks, CD-ROM drives, and other SCSI devices
- * Up to 160 MB of EDO DRAM
- * Up to 4 MB of video RAM
- * Communication slot for optional internal modem or Ethernet card (Ethernet Card installed in some configurations)

Compatibility

- * Supports Open Transport networking software (TCP/IP and AppleTalk)
- * Runs most 680x0 Macintosh applications as well as applications accelerated for Power Macintosh computers
- * Reads Mac OS, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats
- * Runs MS-DOS and Windows applications via optional PC Compatibility Cards from Apple
- * Comes with all of the software required for Internet access

System 7.5 software

- * Makes working with different applications consistent, so they're easier to learn and use
- * Allows easy customization of your Macintosh to reflect the way you work
- * Provides active assistance in learning new features with Apple Guide

Ordering Information

=====

Power Macintosh 4400/200 (US)

Order No. M5767LL/A

- * Power Macintosh 4400/200 computer with 256K level 2 cache, 16 MB of EDO DRAM,

2 MB video RAM, built-in Ethernet, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 1.2 GB hard disk drive, and an internal 8x-speed CD-ROM drive. Includes keyboard and mouse; system software version 7.5.3 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Power Macintosh 4400/200 (Europe/Latin America)

Order No. M5766LL/A

* Power Macintosh 4400/200 computer with 16 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 1.2 GB hard disk drive, and an internal 8x-speed CD-ROM drive. Includes keyboard and mouse; system software version 7.5.3 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Power Macintosh 4400/200 (Europe)

Order No. M5842LL/A

* Power Macintosh 4400/200 computer with 256K level 2 cache, 24 MB of EDO DRAM, 2 MB video RAM, built-in Ethernet, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 1.6 GB hard disk drive, and an internal 8x-speed CD-ROM drive. Includes keyboard and mouse; system software version 7.5.3 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Power Macintosh 4400/200 (Japan)

Order No. M5773LL/A

* Power Macintosh 4400/200 computer with 256K level 2 cache, 16 MB of EDO DRAM, 2 MB video RAM, built-in Ethernet, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 1.2 GB hard disk drive, and an internal 12x-speed CD-ROM drive. Includes keyboard and mouse; system software version 7.5.3 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Power Macintosh 4400/200 (Asia)

Order No. M5839LL/A

* Power Macintosh 4400/200 computer with 16 MB of RAM, 2 MB video RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 1.2 GB hard disk drive, and an internal 8x-speed CD-ROM drive. Includes keyboard and mouse; system software version 7.5.3 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Power Macintosh 4400/200: Technical Specifications (4/97)

Revised: 4/30/97
Security: Everyone

Power Macintosh 4400/200: Technical Specifications (4/97)

=====

Article Created: 19 January 1997
Article Reviewed/Updated: 30 April 1997

TOPIC -----

This article contains a description of the Power Macintosh 4400/200 series computer.

DISCUSSION -----

Microprocessor

=====

- * 200-MHz PowerPC 603e microprocessor
- * Integrated floating-point unit and 32K internal cache

Memory

=====

- * 16 or 24 MB of EDO DRAM (depending on configuration), expandable to 160 MB
- * 4 MB of ROM
- * 256K level 2 cache (included with some configurations)
- * 2 MB EDO DRAM DIMM (VRAM) (included with some configurations), expandable to 4 MB SGRAM

There is one VRAM slot. VRAM is supported in 1 MB, 2 MB or 4 MB configurations; using these types of VRAM DIMMs:

- +5 V Extended Data Output (EDO) DRAM, 1 MB or 2 MB.
- +3.3 V Synchronous Graphics Random Access Memory (SGRAM), 1 MB, 2 MB or 4 MB.

Disk drives

=====

- * 1.2 or 1.6 GB IDE hard disk (depending on configuration)
- * Internal Apple SuperDrive floppy disk drive
 - Accepts high-density 1.4MB disks and 800K disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- * Internal 8x- or 12x- speed (depending on configuration) ATAPI CD-ROM drive

Interfaces

=====

- * Two PCI expansion slots compatible with PCI 2.0-compliant cards (one 12-inch and one 7-inch)
- * One communication slot for internal modem or Ethernet card (Ethernet card installed in some configurations)
- * Two high-speed DMA serial (RS-232/RS-422) ports compatible with LocalTalk cables and GeoPort devices
- * Internal/external SCSI bus (up to 5 MB/s) for up to 7 external SCSI devices
- * Apple Desktop Bus (ADB) expansion port
- * Mini jacks for stereo audio input and output
 - 16-bit audio
 - Up to 44.1-kHz sampling rate
- * DB-15 connector for monitor

Graphics support

=====

- * 2-D accelerated graphics
 - * Support for 24-bit color at up to 800 by 600 pixels, 16-bit color to 1,152 by 870, and 8-bit color to 1,280 by 1,024 (with standard 2 MB of EDO VRAM)
 - * 2 MB EDO DRAM DIMM (VRAM) (included with some configurations), expandable to 4 MB SGRAM
- There is one VRAM slot. VRAM is supported in 1 MB, 2 MB or 4 MB configurations; using these types of VRAM DIMMs:
- +5 V Extended Data Output (EDO) DRAM, 1 MB or 2 MB.
 - +3.3 V Synchronous Graphics Random Access Memory (SGRAM), 1 MB, 2 MB or 4 MB.

GeoPort telephony (Requires GeoPort Telecom Adapter)

=====

- * 28.8-Kbit/s modem support
- * V.17 fax support
- * GeoPort Fax and GeoPort Telephony software included
- * Speakerphone and answering-machine capability

Clock/calendar

=====

- * Custom integrated circuit with long-life battery

Keyboard and mouse

=====

- * Includes Apple Design Keyboard and ADB Mouse II

Electrical requirements and compliance

=====

- * Line voltage: 110/220 V AC, RMS single phase
- * Frequency: 47 to 63 Hz, single phase
- * Power: 150 W maximum, not including display
- * EPA Energy Star compliant

ADB power requirements

=====

- * Maximum current draw for all devices: 500 mA

(a maximum of three ADB devices is recommended)

* Mouse draws 10 mA

* Keyboard draws 25 to 80 mA (varies with keyboard used)

Size and weight

=====

* Height: 5.43 in. (13.9 cm)

* Width: 15.12 in. (38.4 cm)

* Depth: 17.37 in. (44.2 cm)

* Weight: 24 lb. (9.5 kg)

Environmental requirements

=====

* Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)

* Storage temperature: -40 to 116 degrees F (-40 to 47 degrees sC)

* Relative humidity: 20% to 95% noncondensing

* Maximum altitude: 10,000 ft. (3,048 m)

Configurations

=====

Power Macintosh 4400/200 (US)

Order No. M5767LL/A

* Power Macintosh 4400/200 computer with 256K level 2 cache, 16 MB of EDO DRAM, 2 MB video RAM, built-in Ethernet, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 1.2 GB hard disk drive, and an internal 8x-speed CD-ROM drive. Includes keyboard and mouse; system software version 7.5.3 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Power Macintosh 4400/200 (Europe/Latin America)

Order No. M5766LL/A

* Power Macintosh 4400/200 computer with 16 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 1.2 GB hard disk drive, and an internal 8x-speed CD-ROM drive. Includes keyboard and mouse; system software version 7.5.3 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Power Macintosh 4400/200 (Europe)

Order No. M5842LL/A

* Power Macintosh 4400/200 computer with 256K level 2 cache, 24 MB of EDO DRAM, 2 MB video RAM, built-in Ethernet, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 1.6 GB hard disk drive, and an internal 8x-speed CD-ROM drive. Includes keyboard and mouse; system software verssion 7.5.3 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Power Macintosh 4400/200 (Japan)

Order No. M5773LL/A

* Power Macintosh 4400/200 computer with 256K level 2 cache, 16 MB of EDO DRAM, 2 MB video RAM, built-in Ethernet, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 1.2 GB hard disk drive, and an internal 12x-speed CD-ROM drive. Includes keyboard and mouse; system software version 7.5.3 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Power Macintosh 4400/200 (Asia)

Order No. M5839LL/A

* Power Macintosh 4400/200 computer with 16 MB of RAM, 2 MB video RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 1.2 GB hard disk drive, and an internal 8x-speed CD-ROM drive. Includes keyboard and mouse; system software version 7.5.3 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Macintosh Performa 6400/200 Zip: Specifications (2/97)

Revised: 2/13/97
Security: Everyone

Macintosh Performa 6400/200 Zip: Specifications (2/97)

Article Created: 19 January 1997
Article Reviewed/Updated: 13 February 1997

TOPIC -----

This article contains the technical specifications for the Macintosh Performa 6400/200 computer, which includes an internal Iomega Zip Drive.

DISCUSSION -----

Microprocessor

=====

- * PowerPC 603e processor running at 200 MHz
- * Integrated floating-point unit
- * 40-MHz, 64-bit bus
- * 32K internal cache
- * 256K level 2 cache

Memory

=====

- * Two DIMM expansion slots
- * Comes with 16 MB of RAM (8 MB on logic board and 8 MB in one DIMM socket)
- * Can be expanded to 136 MB
- * Uses 64-bit-wide, 168-pin, noncomposite, 70-nanosecond or faster DIMMs (1K or 2K refresh)

Disk drives

=====

- * Internal Zip Drive (Zip disks hold up to 100 MB of data)
- * Internal 2.4 GB IDE hard disk drive (Macintosh Performa 6400/200)
- * Internal Apple SuperDrive floppy disk drive
 - Uses high-density, 1.4MB floppy disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- * Internal AppleCD 8x drive

Modem

=====

- * 28.8-Kbit/s data/voice/fax modem
- * Built-in error correction and compression (MNP4, V.42, MNP5, V.42bis)

Sound

=====

- * Stereo 16-bit sound
- * SRS surround-sound enhancement
- * Subwoofer speaker
- * Sound-input port (for an Apple PlainTalk microphone, other microphone, or standard mini-plug audio cable)
- * Sound-output port
- * Front headphone jack and volume control

Interfaces

=====

- * SCSI interface port for connecting as many as five external SCSI devices, such as disk drives, CD-ROM drives, and scanners (multiple devices can be connected to each other from one port)
- * Pre-cabled SCSI expansion bay for additional 5.25-inch internal SCSI device
- * Apple Desktop Bus port for mouse, keyboard, and other devices (multiple devices can be connected to each other from one port)
- * Two serial ports (RS-232/RS-422) for an AppleTalk network connection, other network connections, communications equipment (including GeoPort compatible devices), or a printer
- * Video-output port
- * Two PCI expansion slots (require PCI cards that come with a Macintosh driver and are PCI 2.0-compliant; NuBus cards cannot be used in these slots)
- * Communications (Comm II) slot for a 28.8-Kbit/s modem (used by built-in modem)
- * Video input slot for optional Apple Video System (supports NTSC, PAL, and SECAM video formats)
- * Expansion bay for optional Apple TV/FM Radio System
- * Infrared receiver for remote control (provided with Apple TV/FM Radio System)

Display support

=====

- * 1 MB of video RAM
- * 16-bit color for display of up to 32,768 colors on monitors using 640- by 480-pixel or 800- by 600-pixel resolution
- * 8-bit color for display of 256 colors on monitors using 832- by 624-pixel or 1,024- by 768-pixel resolution

Electrical requirements and compliance

=====

- * Line voltage: 100 to 125/200 to 240 V AC, RMS, single phase
- * Frequency: 47 to 63 Hz
- * Power: 220 W maximum (continuous)
- * Includes low-power sleep mode
- * Energy saving in sleep mode.

Size and weight

=====

- * Height: 16 in. (40.6 cm)
- * Width: 7.8 in. (19.8 cm)
- * Depth: 16.9 in. (42.8 cm)
- * Weight: 44.5 lb. (20.18 kg)

Operating environment

=====

- * Operating temperature: 50 to 97 degrees F (10 to 35 degrees C)
- * Storage temperature: -40 to 116.6 degrees F (-40 to 47 degrees C)
- * Relative humidity: 5% to 95%, noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Disability access

=====

- * CloseView software magnifies screen image up to 16 times
- * Easy Access software permits combination keys to be pressed sequentially and enables cursor control from the numeric keypad instead of the mouse
- * Visual beep replaces audible system alerts

Included software

=====

- * ClarisWorks
- * Quicken Special Edition
- * MacLink Plus/Easy Open Translators
- * MacGALLERY Clip Art Treasure Pak
- * ClickArt Performa Collection
- * Photo Deluxe
- * Now Touchbase & Datebook
- * America Online
- * Web Workshop
- * SurfWatch
- * Apple Internet Connection Kit
- * At Ease
- * Apple Telecom
- * Address Book
- * AppleFax
- * MegaPhone

- * The Amazing Writing Machine
- * Thinking Things Collection 2
- * American Heritage Dictionary
- * American Heritage Children's Dictionary
- * ABC World Reference: 3D Atlas
- * Grolier's Multimedia Encyclopedia
- * Our Times
- * Mayo Clinic Family Health v2.0
- * Descent
- * Blockbuster Guide to Movies & Video
- * Club Kidsoft

Software titles may vary and may be modified versions of commercially available products.

Indian Language Kit: Read Me (2/97)

Revised: 2/14/97
Security: Everyone

Indian Language Kit: Read Me (2/97)

=====

Article Created: 19 January 1997
Article Reviewed/Updated: 14 February 1997

TOPIC -----

This article contains the ReadMe file for the Indian Language Kit.

DISCUSSION -----

Thank you for choosing the Indian Language Kit. This document provides specific information and tips for using the Indian Language Kit, including important information on installation and compatibility.

Installation

=====

Locate the Installer application inside Install 1.

Sample Software Folder

=====

The floppy disk set and the CD-ROM both contain the software needed to install the Indian Language Kit. The CD-ROM includes demo applications you can use with your Indian Language Kit.

Installation

=====

Refer to the Macintosh Indian Language Kit Installation and User's Guide for installation and setup information.

If you are installing the Indian Language Kit on the Arabic or Hebrew version of the Mac OS, you may want to choose the left-to-right setting in the "Text" control panel for proper justification of the Roman installer interface during installation.

Installing over a system older than System 7.5.5

=====

We recommend that you use System 7.5.5 or 7.6 for best results. The Indian

Language Kit will not install on systems earlier than 7.5. Users of Apple Menu Options versions earlier than 1.1 (version 1.1 is in systems 7.5.3 and 7.5.5) may get an out of memory message during boot after installing any Apple Language Kit. Version 1.1 does not have this problem. If you update your system, such as upgrading System 7.5.3 to System 7.5.5, you should boot with extensions off and reinstall the Indian Language Kit.

Installing with other Apple Language Kits

=====

Multiple Apple Language Kits can be installed on one system for true multilingual computing. However, language kits which are older than the Indian Language Kit should be installed first so that those language resources can be updated by the Indian Language Kit installer. Older Apple Language Kits which should be installed first include: Chinese Language Kit 1.1, Chinese Language Kit 1.1.1, Arabic Language Kit 1.0.1, Hebrew Language Kit 1.0.1, Cyrillic Language Kit 1.0, Japanese Language Kit 1.2 and Korean Language Kit 1.0.

Key Caps Application

=====

The Key Caps Desk Accessory included with the system software (up to 7.6) has been updated to provide better support of Indian languages as part of the Indian Language Kit project. This new Key Caps is an application which can be launched from anywhere you place it on your hard disk. The Indian Language Kit automatically places it in your Apple Menu if one already exists there with the name "Key Caps." On any non-English system, the new Key Caps application is installed into the Apple Extras folder. You can drag it into the Apple Menu Items folder within the active system folder if you want to see it in the Apple Menu. There is no harm in deleting the localized Key Caps DA with other names. If you remove the Indian Language Kit, Key Caps will not be deleted. You can delete it manually by opening your Apple Menu Items folder inside the System Folder, but there is no need to do so.

One anomaly found too late to fix, is that when switching keyboard layouts on NuBus Power Macintosh models running a system older than Mac OS 7.6, the font will occasionally display improperly. If this happens, switch to a keyboard layout of another language and switch back to the desired keyboard layout.

Printer Drivers

=====

The Indian Language Kit is not compatible with LaserWriter drivers earlier than 8.3. For best results, use the LaserWriter 8.4.1 installer included on the Indian Language Kit 1.0 CD.

Indian System and Application fonts

=====

In Font menus throughout the system you will see additional fonts for each language with a different suffix. For example, you will see Devanagari MTS and Devanagari MT. These are mostly the same, except the MTS version uses Chicago as its associated Roman font and has no bold. For this reason you should avoid using the MTS versions of the fonts. Instead use the MT versions of the fonts for each Indian language.

Furthermore, if QuickDraw GX is being used, you will see some additional fonts

that begin with a period (.) and end with X at the top of the Font menu of GX savvy applications. These should NOT be used. For example, you can see a font listed with the name ".Devanagari MT X" which should not be used. Instead, select the font "Devanagari MT." For technical reasons, these fonts cannot be hidden. In future versions of the Indian Language Kit with QuickDraw GX, we hope these fonts will not be visible.

* The fonts you might see in Font menus of GX savvy applications throughout a system with QuickDraw GX installed, which you must NOT use are:

.Devanagari MT X
.Devanagari MT X (Bold)
.Gujarati MT X
.Gujarati MT X (Bold)

* Fonts you will see on any system with the Indian Language Kit installed, which do not print well in bold and which you should avoid using are:

Devanagari MTS
Gujarati MTS
Gurmukhi MTS

* Preferred fonts for all normal usage:

Devanagari MT
Gujarati MT
Gurmukhi MT

* Third-Party Fonts

The Indian Language Kit only supports non-Apple fonts which are both ISCII and WorldScript compliant.

Removing all or part of the Indian Language Kit

=====

You can remove the Indian Language Kit from your system by using the installer and selecting "Custom Remove" from the popup at the top of the Installer window. If you remove the entire Indian Language Kit by selecting all buttons, a few things which were installed by the Indian Language Kit will remain. These things, for instance SimpleText, will not affect your system in anyway. Anything left behind by the installer after performing a removal of the entire Indian Language Kit can be removed manually by dragging the item to the trash.

You can remove particular keyboards shipped with the Indian Language Kit by expanding the packages in the Installation window, selecting "Custom Remove" from the popup and removing the undesired keyboard only. If you remove an entire package, you will disable input with Indian languages. You must not remove all keyboards for a language unless you remove the "Language Support" as well. In other words, if you have installed Devanagari, you must not then remove all of the Devanagari keyboards: "Inscript Keyboard," "QWERTY Keyboard" and "Nepali Keyboard."

Font Line Height

=====

The height of lines when typing or displaying Indic text is significantly more than that of Roman text of the same point size. This is due to the nature of some Indic characters which extend far below the baseline.

Gujarati QWERTY Keyboard and Period

=====

The Gujarati QWERTY keyboard underwent a minor change after the manual was printed. Instead of the Viraam as the default period (full-stop) on the period key, the period (.) is the default and Viraam can be typed by holding down the Option and Shift keys and typing a period.

Compatible Apple WorldScript and QuickDraw GX Application Programs

=====

Apple makes no warranties or representations regarding the quality or compatibility of third party products. Warranties, if any, relating to such third party products are between the software vendors and their customers.

The Indian Language Kit can be used with many non-Indian application programs that use the Apple WorldScript and/or QuickDraw GX software technology. Refer to the Indian Language Kit User's Guide for features that are only available on a system with QuickDraw GX installed. Programs that use one or both of these technologies include these (or later) versions:

- * HyperCard 2.3, from Apple Computer, Inc.
- * SimpleText 1.3.1, from Apple Computer, Inc.
- * CyberDog 1.2, from Apple Computer, Inc.
- * LightningDraw GX 1.0.3
- * Ready, Set, Go! GX 7.0.3
- * WorldWrite 3.0.1
- * NisusWriter 5.0
- * Netscape 3.0.1

Note: The above list is not intended to be comprehensive. Many non-Indian applications that do not employ WorldScript software technology may provide limited functionality and allow input of Indian characters. Please check with application vendors for more information about their product's support for multilingual systems available on the Mac OS.

Language Kit Additions Folder

=====

After a Custom Remove operation to remove the Indian Language Kit, the Language Kit Additions folder will remain in the Extensions folder. This folder takes almost no hard disk space and causes no harm. It can be manually dragged to the Trash. This folder stores Language Kit Additions files. These files are used by the Language Kits to provide a more localized environment while applications programs, that have been localized, are in use.

Power Macintosh 6500/225 & 6500/250: Specifications (4/97)

Revised: 4/28/97
Security: Everyone

Power Macintosh 6500/225 & 6500/250: Specifications (4/97)

Article Created: 19 January 1997
Article Reviewed/Updated: 28 April 1997

TOPIC -----

This article contains the technical specifications for Power Macintosh 6500/225 and 6500/250 series computers.

DISCUSSION -----

Microprocessor

=====

- * PowerPC 603ev processor running at 225 MHz (Power Macintosh 6500/225)
- * PowerPC 603ev processor running at 250 MHz (Power Macintosh 6500/250)
- * Integrated floating-point unit
- * 50-MHz, 64-bit bus
- * 32K internal cache
- * 256K level 2 cache

Memory

=====

- * Two DIMM expansion slots, no RAM on logic board
- * Includes 32 MB of memory
- * Can be expanded to 128 MB
- * Uses 64-bit-wide, 168-pin, EDO DIMMs (1K or 2K refresh)

Disk drives

=====

- * Internal 2.0 GB IDE hard disk drive (Power Macintosh 6500/225)
- * Internal 3.0 GB IDE hard disk drive (Power Macintosh 6500/250)
- * Internal Apple SuperDrive floppy disk drive
 - Uses high-density, 1.4MB floppy disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- * Internal AppleCD 12x drive
- * Internal Iomega Zip Drive (each cartridge can hold 100 MB)

Sound

=====

- * Stereo 16-bit sound
- * SRS surround-sound enhancement
- * Subwoofer speaker
- * Sound-input port (for an Apple PlainTalk microphone, other microphone, or standard mini-plug audio cable)
- * Sound-output port
- * Front headphone jack and volume control

Interfaces

=====

- * SCSI interface port for connecting as many as five external SCSI devices, such as disk drives, CD-ROM drives, and scanners (multiple devices can be connected to each other from one port)
- * Pre-cabled SCSI expansion bay for additional 5.25-inch internal SCSI device
- * Apple Desktop Bus port for mouse, keyboard, and other devices (multiple devices can be connected to each other from one port)
- * Two serial ports (RS-232/RS-422) for an AppleTalk network connection, other network connections, communications equipment (including GeoPort compatible devices), or a printer
- * Video-output port
- * Two PCI expansion slots (require PCI cards that come with a Macintosh driver and are PCI 2.0-compliant; NuBus cards cannot be used in these slots)
- * Communications (Comm II) slot for a 28.8-Kbit/s modem (used by included Ethernet Card))
- * Video input slot for Apple Video System (supports NTSC, PAL, and SECAM video formats) (Apple Video System included with Power Macintosh 6500/250)
- * Expansion bay for optional Apple TV/FM Radio System
- * Infrared receiver for remote control (provided with Apple TV/FM Radio System)

Graphics support

=====

- * 2 MB synchronous graphics RAM (SGRAM) frame buffer on the logic board.
- * Video display modes supported on built-in monitor port: 640 by 480, 800 by 600, and 832 by 624 at 32 bits per pixel; 1024 by 768 and 1152 by 870 at 16 bits per pixel
- * Built-in 2D and 3D hardware graphics acceleration.

Electrical requirements and compliance

=====

- * Line voltage: 90-130 volts (V) or 180-264 V alternating current (AC), RMS single phase. The computer's voltage needs to be configured manually.
- * Frequency: 47 to 63 Hz
- * Power: 140 watts (W) maximum continuous input power

Size and weight

=====

- * Height: 16 in. (40.6 cm)
- * Width: 7.8 in. (19.8 cm)
- * Depth: 16.9 in. (42.8 cm)

* Weight: 44.5 lb. (20.18 kg)

Operating environment

=====

- * Operating temperature: 50 to 97 degrees F (10 to 35 degrees C)
- * Storage temperature: -40 to 116.6 degrees F (-40 to 47 degrees C)
- * Relative humidity: 5% to 95%, noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Disability access

=====

- * CloseView software magnifies screen image up to 16 times
- * Easy Access software permits combination keys to be pressed sequentially and enables cursor control from the numeric keypad instead of the mouse
- * Visual beep replaces audible system alertss

Configurations

=====

Power Macintosh 6500/225

Order No. M5606LL/A

Computer with 225-MHz PowerPC 603ev processor, 32 MB of RAM, 256K level 2 cache, built-in Ethernet, 2.0 GB hard disk drive, Zip drive, 12x-speed CD-ROM drive, and 1.4 MB floppy disk drive.

Power Macintosh 6500/250

Order No. M5607LL/A

Computer with 250-MHz PowerPC 603ev processor, 32 MB of RAM, 256K level 2 cache, built-in Ethernet, 3.0 GB hard disk drive, Zip drive, 12x-speed CD-ROM drive, 1.4 MB floppy disk drive, and Apple Video System.

Power Macintosh 5500/225: Technical Specifications (2/97)

Article Created: 19 January 1997
Article Reviewed/Updated: 13 February 1997

TOPIC -----

This article contains the technical specifications for the Power Macintosh 5500/225 computer.

DISCUSSION -----

Microprocessor

- * PowerPC 603ev processor running at 225 MHz
- * Integrated floating-point unit
- * 50-MHz, 64-bit bus
- * 32K internal cache
- * 256K level 2 cache

Memory

- * Two DIMM expansion slots, no RAM on logic board
- * Includes 32 MB of memory
- * Can be expanded to 128 MB
- * Uses 64-bit-wide, 168-pin, EDO DIMMs (1K or 2K refresh)

Disk drives

- * Internal 2.0 GB IDE hard disk drive
- * Internal Apple SuperDrive floppy disk drive
 - Uses high-density, 1.4MB floppy disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- * Internal AppleCD 12x drive

Display

=====

Built-in display

- * 15-in. RGB color display (12.8-in. diagonal viewable image size)
- * 0.28-mm dot pitch
- * Noninterlaced, flat, square cathode-ray tube (CRT)
- * User-adjustable resolutions from 640 by 480 pixels to 832 by 624 pixels
- * Resolution can be changed without restarting the computer
- * Refresh rate up to 75 Hz
- * Built-in base tilts from -5 to +15 degrees, swivels a full 360 degrees
- * Meets SWEDAC MPR2 international guidelines for magnetic-field emissions

Graphics support

- * 2 MB synchronous graphics RAM (SGRAM) frame buffer on the logic board.
- * Video display modes supported on built-in monitor port: 640 by 480, 800 by 600, and 832 by 624 at 32 bits per pixel; 1024 by 768 and 1152 by 870 at 16 bits per pixel; 1280 by 1024 at 8 bits per pixel
- * Built-in 2D and 3D hardware graphics acceleration.

Sound

=====

- * Stereo 16-bit sound
- * Apple sound enhancements, including SRS 3D surround sound
- * Built-in stereo speakers
- * Built-in microphone
- * Sound-output port
- * Sound-input port
- * Front headphone jack and volume control

Expansion interfaces

=====

- * PCI expansion slot for industry-standard 6.88-in., 15-watt expansion cards
- * Apple Desktop Bus port for mouse, keyboard, and other devices (multiple devices can be connected to each other from one port)
- * RS-232/RS-422 serial port for an AppleTalk network connection, other networking connections, communications equipment (including GeoPort-compatible devices), or a printer
- * SCSI interface port for as many as six external SCSI devices, such as disk drives and/or CD-ROM drives
- * Communications slot (used by the built-in Ethernet connector)
- * TV/FM radio expansion bay
- * Video-output port for connection to an external monitor for video mirroring (also supports connection to an NTSC or PAL video-out interface box, such as the Apple Presentation System)
- * Video-input connector (Apple Video System) for receiving video input from a VCR, video camera, or other video equipment; supports both composite and S-video input

Disability access

=====

- * CloseView software magnifies screen image up to 16 times

- * Easy Access software permits combination keys to be pressed sequentially and enables cursor control from the numeric keypad instead of the mouse
- * "Visual beep" replaces audible system alerts

Electrical requirements and compliance

=====

- * Line voltage: 110 to 240 V AC, RMS, single phase, nominal
- * Frequency: 50 to 60 Hz
- * Power: 220 W maximum (continuous)
- * Includes low-power sleep mode
- * U.S. EPA Energy Star compliant

Size and weight

=====

- * Height: 17.5 in. (44.5 cm)
- * Width: 15.1 in. (38.3 cm)
- * Depth: 16 in. (40.6 cm)
- * Weight: 47 lb. (21 kg)

Operating environment

=====

- * Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- * Storage temperature: -40 to 116 degrees F (-40 to 47 degrees C)
- * Relative humidity: 5% to 95%, noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Configurations

=====

Power Macintosh 5500/225

Order No. M5761LL/A

Apple Telecom 3.0 & Keyboard Character No Longer Works (1/97)

Revised: 1/20/97
Security: Everyone

Apple Telecom 3.0 & Keyboard Character No Longer Works (1/97)

=====

Article Created: 20 January 1997

TOPIC -----

This article describes a situation where a keyboard character no longer works after installing Apple Telecom 3.0.

DISCUSSION -----

If a keyboard character is not working after installing Apple Telecom 3.0, below is a description of what may have happened.

While in Apple Phone if you:

- 1) clicked the Opens Preferences Window button or choose Preferences under the edit menu,
- 2) clicked the Modem option,
- 3) selected the "use the key combination for answering/hanging up any application",

the default is set to command-space. If you set this to the letter "A" for example, this letter will continue to function in key caps but will stop working in other applications.

Try changing the key character set in "use the key combination for answering/hanging up any application", to a more unique key combination to resolve this.

Mac OS 7.6 and Passive Matrix PowerBook Display Issue (1/97)

Revised: 1/20/97
Security: Everyone

Mac OS 7.6 and Passive Matrix PowerBook Display Issue (1/97)

=====

Article Created: 20 January 1997

TOPIC -----

Sometimes on the restart after installing Mac OS 7.6, or more often after resetting PRAM, the contrast of my PowerBook passive matrix display is very dark. The brightness and contrast controls do not let the screen be adjusted to a more usable level. Is there a workaround?

DISCUSSION -----

Here is a workaround. Restart the PowerBook; after it has fully started press and hold the power button to get the shutdown dialog, then press the "R" key to restart the computer. On startup, the display should be functioning normally, or allow adjustment if you changed the brightness and contrast settings while the display was dark.

Engineering is aware of this issue, and they are working to correct it in a future update.

Affected PowerBook computers

This issue has been duplicated on PowerBook 5300/190 computers only, but may occur on other passive matrix equipped PowerBook computers. It has not been duplicated on the PowerBook 1400cs computer.

This information can also be found in the About Mac OS 7.6 Read Me file.

Mac OS 7.6: Installs Open Transport 1.1.1 (1/97)

Revised: 1/23/97
Security: Everyone

Mac OS 7.6: Installs Open Transport 1.1.1 (1/97)

=====

Article Created: 20 January 1997

TOPIC -----

What version of Open Transport comes with Mac OS 7.6?

DISCUSSION -----

Mac OS 7.6 ships with Open Transport (OT) version 1.1.1. Open Transport 1.1.2 was completed after the date that Mac OS 7.6 was closed for new component submissions, therefore OT 1.1.1 was used.

If you install Mac OS 7.6 on top of a system that already has OT 1.1.2 installed, you get the error "The file "File Name" already on "Hard Disk Name" is more recent than what you are about to install. Click Continue to replace "File Name" with the older version. Click Cancel to leave the disk "Hard Disk Name" untouched".

If you have Open Transport 1.1.2 installed, you get this error dialog seven times during the installation process. The following files need to be replaced during this process:

OpenTransportLib
OpenTptInternetLib
OpenTptAppleTalkLib
Open Transport Library
Open Tpt Internet Library
Open Tpt AppleTalk Library
TCP/IP

This message occurs because there are resources in the System file specific to the OT 1.1.1 in the 7.6 system file. To avoid a mismatch of Open Transport components, and compatibility problems, the Installer removes OT 1.1.2, and installs OT 1.1.1. After installing System 7.6, with Open Transport 1.1.1, you may reinstall OT 1.1.2 and it will work fine.

The Open Transport 1.1.2 Read Me file contains a list of changes made to Open Transport. This read me file is available in the Tech Info Library articles "Open Transport 1.1.2 Read Me - Part 1" and "Open Transport 1.1.2 Read Me - Part 2."

Mac Performa 6400/200: LW Select 310 Isn't Available (1/97)

Revised: 1/20/97
Security: Everyone

Mac Performa 6400/200: LW Select 310 Isn't Available (1/97)

=====

Article Created: 20 January 1997

TOPIC -----

Occasionally when printing to my LaserWriter Select 310 printer from my Macintosh Performa 6400/200, I get an error dialog that states it cannot find the printer. When I open the Chooser and try to reselect the LaserWriter Select 310 printer, I get the same error message.

DISCUSSION -----

This issue is currently under investigation by Apple engineers. Apple has been able to reproduce the this issue when a LaserWriter Select 310 is connected to a Macintosh Performa 6400/200 and is turned off while the computer is starting up. In this case, the Macintosh Performa 6400/200 computer will not be able to see the printer until the computer is restarted.

Important Note

It only occurs on Macintosh Performa 6400/200 computers. Macintosh Performa 6400/180 computers are not affected by this issue.

Workaround

=====

The only workaround to this issue, at this time, is to make sure the LaserWriter Select 310 printer is powered on before powering on the computer. After the Macintosh Performa 6400/200 finishes starting-up, you can power the printer on or off at any time.

Mac OS 7.6: Not Enough Memory & MetroNub (1/97)

Revised: 3/19/97
Security: Everyone

Mac OS 7.6: Not Enough Memory & MetroNub (1/97)

=====

Article Created: 20 January 1997

TOPIC -----

After Installing Mac OS 7.6 on my Power Macintosh 8100 computer, I get an error about not enough memory to initialize the MP API. My system has 96 MB of RAM. What is this, and how much does it need?

DISCUSSION -----

This error message occurs if you have MetroNub 1.2 from MetroWerks installed. On the Code Warrior CD by MetroWerks, they have a document called "MP API FAQs", which is in their Multiprocessing SDK (Software Developer's Kit). MetroWerks states, "The MetroNub debugger extension must have the size specified in its 'sysz' resource increased to 2,580,000 bytes. Use ResEdit or Resourcer to do this."

Please refer to the CD-ROM disc mentioned above, or the System 7.6 Tech Note published by Developer Technical Support.

Mac OS 7.6: About Apple Remote Access Client Read Me (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

This article is the About Apple Remote Access Client ReadMe file which comes with the Mac OS 7.6 installer.

DISCUSSION -----

Apple Remote Access Client for Macintosh Read Me

=====

This document provides late-breaking news about the Apple Remote Access Client that is not covered in the "Apple Remote Access Client User's Guide." You may need to refer to that guide to understand the use of several terms in this document, and you may want to print this document to keep with your user's guide.

Modems Supported by the Apple Remote Access Client

=====

Scripts that support most popular modems are provided on the Remote Access Client installation disks. The scripts include:

3Com Impact Analog 14.4
3Com Impact ISDN 56K
3Com Impact ISDN 64K
Apple Modem 2400
AT&T Dataport 288
AT&T KeepInTouch
Dayna CommuniCard 28800
Farallon Netopia 56K
Farallon Netopia 64K
GeoPort/Express Modem
GeoPort/Express Modem CNG
Global Village Gold/Silver/Mercury

Global Village Platinum
Hayes Accura 288
Hayes Optima 14.4
Hayes Optima 288
Megahertz CruiseCard 14.4
Megahertz CruiseCard 28.8
Metricom Ricochet Wireless
Microcom MicroPorte 4232bis
Microcom QX/4232bis
Motorola 326xV34
Motorola BitSURFR 56K
Motorola BitSURFR 64K
Motorola Power/Lifestyle 28.8
Practical Peripherals V.34
Prometheus ProModem 144e
Prometheus ProModem 96
PSI PowerModem II
PSI PowerModem III/IV
Supra 144
Supra 288
TDK DF2814
Telebit QBlazer
Telebit T3000
Telebit Worldblazer
US Robotics Universal
Zoom V-series

Beginning with version 2.1 of the Apple Remote Access Client and the companion Personal Server product, modem scripts are no longer stored in the Extensions Folder. A new folder called "Modem Scripts" within the Extensions Folder is created by Apple Remote Access to hold modem scripts.

The Apple Remote Access Installer will move any existing scripts you may already have in your Extensions Folder to the new Modem Scripts folder in addition to placing scripts for all the modems listed above into the Modem Scripts folder.

Future remote access products from Apple will also use the Modem Scripts folder. However, there will be a transition period before other products are updated to use the new folder. Some existing products may install modem scripts into the Extensions Folder. If such a product is installed after Apple Remote Access 2.1, you will have to open your Extensions Folder and drag the scripts into the Modem Scripts folder in order for Apple Remote Access to recognize the script.

You can use modem scripts included with the Apple Remote Access MultiPort Server (any version) with version 2.1 of Apple Remote Access Client. You can also use AppleTalk Remote Access version 1.0 modem scripts with version 2.1 of the Client, but certain new features, such as Ignore Dial Tone, Manual Dialing, and MNP 10 support, won't be available. Additionally, you will be able to use scripts from future Apple dial-up products with version 2.1 of Apple Remote Access. But, see the note below on some issues related to manual dialing.

Apple Remote Access and System 7.5.3

=====

The Read Me documents for System 7.5.3 and System Update 2.0 suggest that Apple Remote Access should be installed before System 7.5.3. This is not necessary. Beginning with version 2.1, Apple Remote Access should be installed after System 7.5.3.

Installing ARA X.25 Client over Apple Remote Access 2.1

=====

The Apple Remote Access X.25 Client installer places X.25 scripts into the Extensions folder. If you install the X.25 additions after installing Apple Remote Access 2.1, you will have to open your Extensions Folder and drag the X.25 scripts into the Modem Scripts folder in order for Apple Remote Access to recognize the scripts.

If you use the Apple Remote Access 2.1 installer to upgrade your existing Remote Access 2.0.1 and X.25 Client, the installer will move the scripts for you.

Compatibility with AppleTalk Remote Access 1.0

=====

Version 2.1 of the Apple Remote Access Client will successfully connect to both AppleTalk Remote Access 1.0 compatible servers and Apple Remote Access 2.x compatible servers. The compatibility setting in the connection document of earlier version 2.0 and 2.0.1 has been removed. Since connection to either style server is automatic, the setting is no longer necessary.

The next major upgrade to Apple Remote Access will no longer support ARA 1.0 clients or servers.

Using an MNP 10 Modem

=====

MNP 10 is an error-correction protocol that allows for more reliable data connections over cellular modems. Clicking the "Use MNP 10 error correction in modem" checkbox in the Remote Access Setup window puts MNP 10 modems into cellular mode. Do not click the "Use MNP 10 error correction in modem" checkbox to use MNP 10 over land lines.

To establish an MNP 10 connection, both your modem and the modem you're calling must support MNP 10; clicking the "Use MNP 10 error correction in modem" checkbox in the Remote Access Setup window is not by itself sufficient to establish an MNP 10 connection.

Manual Dialing

=====

The method used to do manual dialing in Apple Remote Access 2.0/2.0.1 has not worked well. Apple Remote Access presents a dialog asking you to dial, wait for the phone to ring, and then press OK. Often the user has to experiment to determine exactly when to press OK to dismiss the dialog.

To improve manual dialing, a new dialog has been incorporated into the modem

scripts installed along with version 2.1 of Apple Remote Access. Two dialogs are now displayed when doing manual dialing. This first dialog is still present to provide backwards compatibility with the wide variety of existing modem scripts. When using newer scripts, the first dialog box should be dismissed before dialing, and you will be prompted by the modem script when to actually dial the phone. If you are using a modem script not included with this product, you may have to experiment to determine if the first dialog box should be ignored.

Future remote access and dial-up products from Apple will require the new style scripts and will not present two dialog boxes.

Using the Redialing Feature =====

If the redialing option is selected, the Remote Access Client attempts redialing only when the phone number that has been dialed is busy. If the connection attempt fails for any other reason including a failed callback attempt, Remote Access stops redialing so that you can correct any problems.

If you use the Redialing option, set the "Time between retries" number to five seconds or greater. Anything less than five seconds may not give your modem sufficient time to reset.

When using the Redialing Alternate Number option, the main number is dialed once and then redialing sequence alternates between the alternate and main numbers.

Using DialAssist =====

If you are calling within a country with no city or area codes, and you encounter problems using DialAssist, try entering a space in the "Connect To City/Area Code" box in your connection document.

Serial Port Arbitration =====

When a Remote Access connection is established, Remote Access prevents other application programs from using the serial port selected in the Remote Access Setup control panel. Most programs will inform you that the port is in use.

Remote Access Client provides this port arbitration through a system extension called the Serial Port Arbitrator located in the Extensions folder. Some programs that use the serial port may not be compatible with this extension. If you suspect that a program is not compatible with the Serial Port Arbitrator:

- 1) Remove the Serial Port Arbitrator file from the Extensions folder.
- 2) Restart your Macintosh.
- 3) Try the program again.

NOTE: The Serial Port Arbitrator will not work on a Macintosh if Remote Access Client has not been installed.

High Speed Serial Connections

=====

Both Apple Remote Access Personal Server 2.1 and Client 2.1 support specifying a serial connection speed of 115,200 bps in a modem script. Not all Macintosh built-in serial ports support connection speed of 115,200 bps. Here is a list of Macintosh computers that do.

Centris/Quadra 660AV, Quadra 840AV
Macintosh Performa 61xx
Power Macintosh 61xx, 71xx, 72xx, 75xx, 76xx, 81xx, 85xx, 95xx
Workgroup Server 6150, 7250, 8150, 8550, 9150

In order to use the serial port at 115200 bps on one of these computers, you need a new serial extension called SerialDMA. System 7.5.3 or later incorporates this driver into the operating system.

If you use a modem script that specifies 115200 bps, and your computer does not support this data rate, Apple Remote Access will automatically fall back to 57600 bps.

Using a Local Printer

=====

If you are using a non-networked printer connected to the printer port of your Macintosh, you may get an error dialog when trying to initiate a connection or when trying to print while connected saying that one of your serial ports is already in use. You may need to select Remote Only in the Network Control Panel (AppleTalk Control panel for Open Transport-based machines).

Apple Remote Access Client and the Apple Internet Router

=====

Apple Remote Access Client should not be installed on the same Macintosh as the Apple Internet Router.

Using ARA Security Modules (like SecurID) with Virtual Memory

=====

There is an incompatibility between some ARA security modules (like SecurID) and Virtual Memory. This bug has been fixed in the latest system release (7.5.3).

Changes in version 2.1 of the Apple Remote Access Client

=====

Modem scripts have been moved to a new Modem Scripts folder within the Extensions Folder.

The compatibility option in the connection document is no longer necessary and has been removed.

The method of manual dialing has been changed. See the section above.

Interoperability with some non-Apple Remote Access Servers has been improved.

The installer has been upgraded from version 3.4 to version 4.0.3.

There is no longer a separate Remote Access Aliases extension.

The installer is now on a single high-density diskette.

A bug that caused machines with certain extensions to crash during boot has been fixed in the Serial Port Arbitrator.

Serial port rates of up to 115,200 bps are now supported in modem scripts. If the computer doesn't support 115,200, Apple Remote Access will use 57,600 bps instead.

Mac OS 7.6: About AppleShare 3.6.4 Read Me (1/97)

Revised: 1/24/97
Security: Everyone

Mac OS 7.6: About AppleShare 3.6.4 Read Me (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

This article is the About AppleShare 3.6.4 ReadMe file.

DISCUSSION -----

About AppleShare 3.6.4

If you have AppleShare versions 3.6, 3.6.1, or 3.6.2, you should update to AppleShare 3.6.4 before installing Mac OS 7.6 over a network.

If you have an earlier version of AppleShare, you do not need to install AppleShare 3.6.4.

Installing AppleShare 3.6.4

- 1) Drag the AppleShare 3.6.4 icon to your closed System Folder icon.
- 2) In the dialog box that appears, click OK to place AppleShare in your Extensions folder.
- 3) In the next dialog box that appears, click OK to replace your older version of AppleShare with the newer one.
- 4) Restart your computer.
- 5) Connect to the server you're using to install Mac OS 7.6.
- 6) Double-click the Install Mac OS icon to install the software.

Mac OS 7.6: About CD Extras Read Me (1/97)

Article Created: 24 January 1997

TOPIC -----

This article is the About CD Extras ReadMe file.

DISCUSSION -----

About CD Extras

This document includes brief descriptions of the software in the CD Extras folder. This Apple and third-party software extends the usefulness and power of Mac OS 7.6. Check the folders for each software product for more information about the software.

IMPORTANT: If you have questions about any third-party application programs in the CD Extras Folder, contact the software vendor directly. The telephone number or address for each vendor is located with the software program.

At Ease Updaters

Use these programs to update At Ease versions 2.0 or 2.01 to version 2.03, and to update At Ease for Workgroups version 3.0 to version 3.01.

QuickDraw 3D Extras

This folder includes sample 3D textures and models. It also includes a pre-release version of Cumulus 2.5, an image database system. You can use Cumulus to view all the images and textures included with the QuickDraw 3D Extras. The folder also includes the Gerbils game, to experiment with 3D images as you maneuver images of gerbils on a roller coaster.

HyperCard Player

You use the HyperCard Player to open HyperCard stacks. HyperCard stacks are arrangements of text, pictures, and other elements on sequential screens, or

cards. Some HyperCard stacks hold information; other stacks work like applications, requesting information from users and making calculations with that information.

MoviePlayer Extras

The MoviePlayer application, installed in your Apple Extras folder, plays QuickTime movies. The MoviePlayer Extras folder includes two "plug-in files"—Authoring Extras and Goodies, that add some extra features to the MoviePlayer application. MoviePlayer Extras also includes some sample QuickTime movies.

Other Extras

-
- Eric's Solitaire Sampler, a solitaire game by Delta Tao Software
 - Pointer Mode control panel, to ensure the pointer appears in screen captures
 - additional desktop patterns

Mac OS 7.6: About Desktop Printing Read Me (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

This article is the About Desktop Printing ReadMe file.

DISCUSSION -----

Important Information About Desktop Printing

This document contains information about using the desktop printing feature on your computer. With desktop printing, a printer icon is created on your desktop whenever you select an Apple LaserWriter or StyleWriter printer in the Chooser. You can use these "desktop printer" icons to print documents and manage printing.

With desktop printing, you can

- print a document in the Finder by dragging it to a desktop printer icon
- select the default printer without opening the Chooser
- manage and schedule printing documents

Contents of this document

Creating Desktop Printers
Printing With a Desktop Printer
Selecting a Default Printer
Working With Desktop Printer Icons
Managing Printing
Turning Off Desktop Printing
Support and Compatibility Information
Troubleshooting
Desktop PrintMonitor Software Components

IMPORTANT: Desktop printing works with Apple StyleWriter printers, Apple LaserWriter printers, and many other PostScript printers. Desktop printing does not work with other types of printers and Fax Sender.

Creating Desktop Printers

To create a desktop printer, follow these steps:

- 1) Open the Chooser.
- 2) Select the print driver for the printer you are using.
- 3) Select the printer you want to use.
- 4) Close the Chooser.

When you close the Chooser, an icon for the printer appears on the desktop. The name of the icon is the name of the printer. The name of the printer also appears in the Printer menu to the left of the Guide menu and in the Desktop Printers item in the Apple menu.

After the desktop printer icon appears, you can move it to any location on your startup disk.

You can have as many desktop printers as you want. To create other desktop printers, you must open the Chooser, select the printer, and close the Chooser for each printer you want to use.

The last printer you select in the Chooser becomes the default printer. The default printer is used whenever you choose Print from the File menu. The desktop printer icon for the default printer has a bold outline. For other ways to select the default printer, see "Selecting a Default Printer" later in this document.

NOTE: If you use different versions of the LaserWriter 8 software to print to the same printer, you can create a desktop printer icon for each version of the LaserWriter software. For example, you might use LaserWriter driver version 8.3 for printing and version 8.2.2f for faxing. To create a desktop printer for each driver, select the LaserWriter 8.3 driver and your printer in the Chooser, then close the Chooser. Reopen the Chooser and select the LaserWriter 8.2.2f driver and your printer, then close the Chooser. To choose which version of the driver to use, change the default printer (see "Selecting a Default Printer"). To avoid confusion, rename the desktop printer icons to indicate which version of the printer software the icon uses.

Printing With a Desktop Printer

You use desktop printers to print documents from the Finder. Using desktop printers, you can print several documents at the same time, including documents created with different programs. (You can still print documents from within applications using the Print command in the File menu.)

To print documents with a desktop printer, follow these steps:

- 1) Select the icons of the documents you want to print.

2) Drag the documents to the icon of the desktop printer you want to use.

NOTE: When you drag a document to a desktop printer, that printer becomes the default printer.

The document opens and the Print dialog box appears.

3) Choose your printing options, then click the Print.

Selecting a Default Printer

The default printer is the printer you use when you choose Print from the File menu.

To change the default printer, you can do the following:

- Print documents from the Finder with a desktop printer icon.
- Select a desktop printer icon and choose Set Default Printer from the Printing menu.
- Choose the printer from the Printer menu that appears to the left of the Guide menu.
- Select the printer name using the Printing module in the Control Strip.
- Select a new printer in the Chooser.

NOTE: Changing the printer you are using may change how much information appears on a page of your document. If you change printers, check the formatting of your document.

Working With Desktop Printer Icons

Desktop printer icons show the status of the printer:

- Plain icon indicates a printer that is not currently chosen for printing.
- Default icon indicates the printer you have currently chosen to print on.
- Printing icon indicates a document is printing on this printer.
- Stopped icon indicates you have stopped the print queue.
- Error icon indicates there is an error on this printer. Double-click the icon to see a message.
- Disabled icon indicates this desktop printer is not available.

You can rename desktop printer icons, make aliases of them, and throw them away, just like other Finder icons.

NOTE: You can't throw away a desktop printer icon while the printer is printing

a document.

If you throw away the icon for the default printer, another desktop printer is automatically selected as the default printer. If you do not have another desktop printer another icon is automatically created for the desktop printer you are throwing away. To throw away the last desktop printer icon, you must select a printer in the Chooser that does not support desktop printing.

Managing Printing

If background printing is turned on for the printer you are using, you can use desktop printing to manage print jobs. You perform tasks with the Printing menu that appears when you select a desktop printer. You perform other tasks by using the desktop printer window that opens when you double-click a desktop printer icon.

To manage printing using the Printing menu:

The Printing menu appears to the right of the Special menu when you select a desktop printer icon.

Using the Printing menu you can do the following:

- Choose Start Print Queue to restart printing.

NOTE: You need to choose Start Print Queue to restart printing if you click the Stop Queue button in a printer alert message.

- Choose Stop Print Queue to stop printing all of your documents. The icon of the printer indicates that you have stopped printing.
- Choose Get Printer Info to see information about the printer. (Only available for some printers.)
- Choose Change Setup to change the setup of the printer. (Only available for some printers. You can change the setup of other printers using the Chooser.)
- Choose Show Manual Feed Alert to turn the manual alert on or off.
- Choose Set Default Printer to select the printer as the default printer, if it isn't selected already.

To manage printing using the desktop printer window:

Double-click a desktop printer icon to open its window.

The name of the document currently printing and status messages about the current print job appear in the upper box. The status messages can help you troubleshoot a printing problem.

When you are printing more than one document, a list of the print jobs appears

in the lower box. If this list is sorted by the Print Time column, it shows the order in which the documents will be printed.

Using the desktop printer window, you can do the following tasks:

- To change the sort order of the print job list, click the title of the column by which you want to sort. The column title by which the list is sorted is underlined. For example, to sort by the name of the document, click Document Name.

Note: Changing the sort order of the print jobs does not change the order in which they will print. To see that order, click the Print Time heading.

- To cancel printing a document, select the print job in the list and click the Remove button. You can also drag the print job from the window to the Trash icon on the desktop.

Note: These methods do not delete the document itself.

- To put printing a document on hold, select the print job in the list and click the Hold Job button. You can also put the document that's currently printing on hold by dragging it to the print job list.

- To resume printing a document, select the print job and click the Resume Job button.

- To print a document immediately, select the print job and put it on hold. Next, click the Set Print Time icon button and select Urgent in the dialog box that appears, then click OK. You can also drag the print job to the top of the print job list or to the area reserved for the currently printing job.

- To schedule printing, select a print job and click the Set Print Time button. In the Set Print Time dialog box, click At Time and set the time you want. Then click OK.

- To change the print order, drag the name of a print job up or down in the print job list.

- To print the document using another desktop printer, drag the print job to the icon of the other desktop printer. That printer becomes the default printer. You can only move a print job to another printer of the same type. For example, you can't move a print job from a LaserWriter printer to a StyleWriter printer.

- To stop printing all documents, hold down the Option and Shift keys and click the Hold Job button. You can also choose Stop Print Queue from the Printing menu.

- To start printing documents, hold down the Option and Shift keys and click the Resume Job button. You can also choose Start Print Queue from the Printing menu.

Turning Off Desktop Printing

If you don't want to use desktop printers, you can turn off Desktop PrintMonitor using the Extensions Manager control panel.

IMPORTANT: Before you turn off Desktop PrintMonitor, be sure that all documents have finished printing. If there are documents waiting to print that you do not want to print, you can cancel printing as described in the previous section on this document.

To turn off Desktop PrintMonitor, follow these steps:

- 1) Open the Extensions Manager control panel.
- 2) Click the boxes next to these extensions to remove the X:
 - Desktop PrintMonitor
 - Desktop Printer Extension
 - Desktop Printer Spooler
 - Desktop Printer Menu extensions
- 3) Click the close box to close the control panel.
- 4) If your computer has a Control Strip, drag the Printer Selector file from the Control Strip Modules folder in the System Folder to the Trash.
- 5) Restart your computer.

Support and Compatibility Information

- Some third-party printers do not support desktop printing. If no desktop printer icon is created after you select your printer in the Chooser, it is likely that your printer does not support Desktop PrintMonitor. Please contact the vendor of your printer to see if there is a version of the print driver that is compatible with Desktop PrintMonitor.

- When you choose Save or Open in an application and look at files and folders on the desktop, desktop printers appear in the list as if they are folders. Do not save documents in a desktop printer "folder." If you do, you will not be able to access the document in the Finder.

IMPORTANT: If you save a document in a desktop printer "folder," use the Save As command to save the document in a different location as soon as possible.

NOTE: You cannot remove a document that you save in a desktop printer icon. If you want to delete the document, throw away the desktop printer icon and select the printer in the Chooser again.

- Desktop PrintMonitor supports drag-and-drop printing for all files that cause the Print command in the File menu to become available. Since clipping files do not make the Print command available, they cannot be dragged to a desktop printer icon for printing.

- Apple's Fax Sender software is not supported by Desktop PrintMonitor. Fax Sender is fully functional when Desktop PrintMonitor is installed; however, it does not use Desktop PrintMonitor's features.

IMPORTANT: When you select Fax Sender in the Chooser, you will not have a default desktop printer until you select a printer icon and choose Set Default Printer from the Printing menu.

Troubleshooting Tips

You see an alert message with error numbers "-192" or "15."

Problem: After installing Desktop PrintMonitor and restarting your computer, you see error message "-192" or "15" when you try to open files or folders in the Finder. This may occur when the Now Startup Manager preferences file has become corrupted.

Solution: Hold down the Shift key while restarting your computer to turn off extensions. Then throw away the Now Startup Manager preferences file. Restart your computer normally.

IMPORTANT: Before you throw away the Now Startup Manager preferences file, you may want to write down your preferences.

You receive an alert message that the desktop printer cannot be found.

Problem: When you try to print, the spool file for the print job is moved to the Trash and an alert message appears saying that the desktop printer could not be found.

Solution 1: It's possible that the desktop printer icon is damaged. To fix this, drag the desktop printer icon to the Trash and reselect the printer in the Chooser. A new desktop printer icon will be created.

Solution 2: If your printer software is not published by Apple Computer or Adobe Systems, it may not be compatible with Desktop PrintMonitor. If this is the case, turn off Desktop PrintMonitor (as described earlier in this document) and use an older version of PrintMonitor.

The "Not enough memory" message appears after you drag files to a desktop printer icon.

Problem: When you drag documents created by different software applications to your desktop printer icon, a message appears that says there is not enough memory to continue.

Solution: Because the application used to create a document opens when you print the document, your computer must have enough random-access memory (RAM) available to open all of the programs for the documents you are printing. To resolve this situation, print your documents individually or in smaller groups.

The "Out of Paper" message remains after you add paper to the printer.

Problem: You are using a LaserWriter 300 and the "Out of Paper" message doesn't go away automatically after you add paper to the printer.

Solution: If you are using Desktop PrintMonitor with the LaserWriter 300 driver, the "Out of Paper" message will not go away automatically after you add paper to the printer. The only way to work around this problem is to turn off Desktop PrintMonitor as described earlier in this document and use an older version of PrintMonitor.

A document printed on a Color StyleWriter does not have the correct colors.

Problem: Documents printed on a Color StyleWriter do not have the correct colors after you put printing on hold and then resumed printing.

Solution: To avoid this problem, always resume printing on page one.

Mac OS 7.6: About English Text-to-Speech Read Me (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

This article is the About English Text-to-Speech ReadMe file.

DISCUSSION -----

Using the English Text-to-Speech Software.

With the English text-to-speech software installed, many Macintosh programs can read English text out loud. One of the programs that can read to you is the SimpleText program, which comes with this computer and is already installed on your hard disk. (You are probably reading this document using the SimpleText program.)

The instructions in this document tell you:

- what you need to use this software;
- how to install the software;
- how to try out the software using SimpleText;
- how to choose a standard (default) voice;
- some technical details;
- how to solve common problems.

What you need to use the English text-to-speech software.

To use the software, you need the following software and hardware.

- a Macintosh or Power Macintosh computer;
- version 6.0.7 or later of system software;
- at least 300 kilobytes of RAM in addition to what the rest of your system software takes;
- at least 5 megabytes of space available on your hard disk.

Installing the software.

To install the English text-to-speech software, follow these steps.

1. Print these instructions before you start. You will not be able to view them on screen during the installation.
2. If you have been using an earlier version of text-to-speech software, see the note for you at the end of this section.
3. Quit any programs you have been using.
4. While holding down the Shift key on the keyboard, choose Restart from the Special menu. Don't release the Shift key until you see the "Extensions Off" message on your screen.
5. To start the Installer program, double-click its icon. You can find the Installer program in the same place you found these instructions.
6. In the introductory screen that appears, click Continue.
7. In the next screen, click Install. The installation takes a few minutes.
8. When you see a message reporting that the installation was successful, click Restart.

After the computer restarts, you can start using the text-to-speech software. You can try it out using the instructions in the next section.

Note for users of PlainTalk 1.0: The improved version of MacinTalk Pro included with this text-to-speech software is intended to replace the old PlainTalk text-to-speech software. However it may not work with some computers that have a 68030 processor. If you have such a computer and want to keep using the old PlainTalk text-to-speech software, you should not use the standard Install procedure described in these steps. Instead, after step 6, choose Custom Install from the pop-up menu, select MacinTalk 2 or MacinTalk 3, then proceed with steps 7 and 8.

Trying out the text-to-speech software.

You can try out the text-to-speech software in the SimpleText program by following these steps.

1. Open any SimpleText document. Or, since this document is already open, you can do the remaining steps with it.
2. Click anywhere in the text to make sure nothing is selected.
3. Choose "Speak All" from the Sound menu. (If you cannot hear anything, you may have the sound turned all the way off. Check in the Sound or "Sound & Displays" control panel.)

4. If you want the computer to stop reading, choose Stop Speaking from the Sound menu.

You can also try the following:

- To read a portion of the file, select the words you want to read then choose Speak Selection from the Sound menu.
- To have the computer speak in a different voice, select a voice from the Voices sub-menu in the Sound menu, then choose the Speak All or Speak Selection command from the Sound menu.
- To use the text-to-speech features of other programs, see the instructions that came with those programs.

Choosing a standard (default) voice.

If you have system software version 7.0 or later, you can use the Speech control panel to choose your favorite voice to be the default voice for all your programs. (To use the Speech control panel on some black-and-white 68000 computers, like the Macintosh SE, you need to have system software 7.1 or later.) To set the default voice, follow these steps.

1. Open the Control Panels window by pulling down the Apple menu and choosing Control Panels.
2. Open the Speech control panel by double-clicking its icon in the Control Panels window.
3. Open the Options pop-up menu at the top of the Speech control panel and choose Voice.
4. To change the default voice, choose the voice you want from the Voice pop-up menu. To hear what the voice you chose sounds like, click the speaker button. If you're concerned about RAM usage, Agnes, Bruce, and Victoria take about 1,500 kilobytes of RAM; the rest take 300 kilobytes or less.
5. To change the rate at which the default voice speaks, move the slider.
6. Close the control panel.

Turning Talking Alerts on or off.

If you have system software version 7.0 or later, you can use the Speech control panel to turn the Talking Alerts feature on or off. When this feature is on, your Macintosh will speak the contents of alerts to you. (An alert appears, for example, when your printer runs out of paper while printing.) To turn the Talking Alerts feature on, follow these steps.

1. Open the Control Panels window by pulling down the Apple menu and choosing

Control Panels.

2. Open the Speech control panel by double-clicking its icon in the Control Panels window.
3. Open the Options pop-up menu at the top of the Speech control panel and choose Talking Alerts.
4. To have your Macintosh speak a phrase like "Alert!" or "Hey!" when an alert appears, click the "Speak the phrase" check box to put an X in it, and choose the phrase you want to be spoken from the adjacent pop up menu.
5. To have your Macintosh speak the content of an alert when one appears, click the "Speak the alert text" check box to put an X in it.
6. To adjust how long your Macintosh delays after an alert appears before speaking the alert text, adjust the slider beneath the "Speak the alert text" check box.
7. To test how Talking Alerts will behave with your chosen settings, click on the speaker icon to the right of the slider.

Whenever Talking Alerts is speaking the text of an alert, you can stop it by clicking the mouse or typing any key.

Technical details.

The software that enables your computer to speak has these components:

- Speech Manager, a system extension;
- one or more of these English speech synthesizers, depending on your hardware and software:
 - MacinTalk 2 for standard-quality speech,
 - MacinTalk 3 for high-quality speech,
 - MacinTalk Pro for highest-quality speech.
- several voice files, each identified with one particular synthesizer;
- the Speech control panel (if you have system software 7.0 or later).

The Installer installs the files that are appropriate for your system.

- If you have version 6.0.7 or 6.0.8 of system software on any Macintosh, these files are installed.
 - Speech Manager, in the System Folder;
 - MacinTalk 2, in the System Folder;
 - 9 voices, in the Voices folder, which is in the System Folder.
- If you have version 7.0 or later of system software on a Power Macintosh or on a Macintosh with a 68040 processor, the following files are installed.

- Speech Manager, in the Extensions folder;
 - the Speech control panel, in the Control Panels folder;
 - MacinTalk 3 and MacinTalk Pro, in the Extensions folder;
 - 19 MacinTalk 3 voices, in the Voices folder, which is in the Extensions folder;
 - 3 MacinTalk Pro voices (Agnes, Bruce, and Victoria), also in the Voices folder.
- If you have version 7.0 or later of system software on a Macintosh with a 33 MHz or faster 68030 processor, the following files are installed.
 - Speech Manager, in the Extensions folder;
 - the Speech control panel, in the Control Panels folder;
 - MacinTalk 3, in the Extensions folder;
 - 19 voices, in the Voices folder, which is in the Extensions folder.
 - If you have version 7.0 or later of system software on any other computer, the following files are installed.
 - Speech Manager, in the Extensions folder;
 - the Speech control panel, in the Control Panels folder;
(Note: On Macintosh SE computers, the Speech control panel requires version 7.1 or later of the system software)
 - MacinTalk 2, in the Extensions folder;
 - 9 voices, in the Voices folder, which is in the Extensions folder.

Troubleshooting (problems and solutions).

-
- My Macintosh won't speak.
 - Turn up the speaker volume in the Sound control panel.
 - Choose a voice that requires less random-access memory. The voices Agnes, Bruce, and Victoria take the most memory.
 - The Installer program says there's a problem with the hard disk.
 - Re-install your system software, then try installing the English text-to-speech software again.
 - The Installer program displays other error messages.
 - Make sure you restart the computer with extensions off, as described in "Installing the Software," above.
 - I had an older version of text-to-speech software, then did a custom installation of the new software, but some of my older voices disappeared.
 - The custom installation you chose erased the older version of the software that can use those voices. You can install newer versions of the voices by doing another custom installation of the new software to install MacinTalk 2 or MacinTalk 3 -- whichever you used to have. (If you're not sure which you had, you can install both.)

Mac OS 7.6: About MacLinkPlus Read Me (1/97)

Revised: 1/24/97
Security: Everyone

Mac OS 7.6: About MacLinkPlus Read Me (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

This article is the About MacLinkPlus Read Me file which comes with the Mac OS 7.6 CD-ROM disc.

DISCUSSION -----

For more information regarding MacLinkPlus, check out our World Wide Web page at <http://www.dataviz.com> or e-mail us at info@dataviz.com.

What is MacLinkPlus?

MacLinkPlus is file translation software which allows you to:

- Easily use DOS/Windows files on your Mac
- Convert Mac files into DOS/Windows files
- Convert between different Mac formats

When translating between different Mac and PC formats, such as Word Mac and WordPerfect for Windows, MacLinkPlus makes sure the file's original formatting remains intact (that is, bold, italics, graphics, etc.). Once a file is translated, you can actually use the file in the new application format (in this case WordPerfect for Windows) just as if it were originally created there! MacLinkPlus can convert between thousands of combinations of files, including word processing, spreadsheet, graphics and database formats.

Who needs MacLinkPlus?

-
- Anyone who needs to use files created in DOS or Windows applications
 - Anyone who needs to use files created in Macintosh applications different from the one they use (that is, you use Word Mac, but your colleagues use ClarisWorks or WordPerfect, etc.)

It's there when you need it - automatically!

Perhaps the best thing about MacLinkPlus is that you won't see it until you need it. Your Macintosh came with a System Extension called Macintosh Easy Open. When you double-click on a file that wasn't created by an application you have, Easy Open pops up choices of applications on your Mac you can open the file into with the help of MacLinkPlus file translation.

The MacLinkPlus QuickStart "card" included in the MacLinkPlus folder provides more information on the uses of MacLinkPlus.

Mac OS 7.6: About MoviePlayer Extras Read Me (1/97)

Revised: 1/24/97
Security: Everyone

Mac OS 7.6: About MoviePlayer Extras Read Me (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

This article is the About MoviePlayer Extras ReadMe file.

DISCUSSION -----

What is MoviePlayer?

MoviePlayer is the default application for playing QuickTime movies on Mac OS-based computers. When you double click a QuickTime movie, the MoviePlayer program opens. MoviePlayer is automatically installed with Mac OS version 7.6 and later versions. You can find MoviePlayer in the Apple Extras folder.

What's in MoviePlayer Extras?

MoviePlayer Extras includes two "plug-in files"—Authoring Extras and Goodies. These files add some extra features to the MoviePlayer application. These extra features are useful for creating your own movies. Some of the added features include:

- editing a movie's text track
- adding or editing copyright information
- adding or switching to a different color table
- specifying track preloading

To utilize these and other authoring features, place the plug-in files in the same folder as MoviePlayer.

Sample QuickTime movies are also included. Double-click a movie to watch it.

Problems playing long movies?

MoviePlayer's application memory size is preset to 400K. This size should work well for short movies. If you find that playback of higher data-rate movies is

not smooth, increase MoviePlayer's minimum memory size. (First, quit the MoviePlayer application. Then select the MoviePlayer icon and choose Get Info from the File menu. Increase the number in the Minimum Size box.)

Mac OS 7.6: About Multiprocessing Software Read Me (1/97)

Revised: 1/24/97
Security: Everyone

Mac OS 7.6: About Multiprocessing Software Read Me (1/97)

Article Created: 24 January 1997

TOPIC -----

This article is the About Multiprocessing Software ReadMe file.

DISCUSSION -----

Important Information
About the Multiprocessing Software

This document provides information about the multiprocessing (MP) software included with Mac OS 7.6 and how to configure your computer properly to take advantage of multiprocessor performance. You use multiprocessing software to use two processors at the same time, which increases your computer's speed. Multiprocessing software is only installed on computers with more than one PowerPC processor.

CORRECTION: Mac OS 7.6 will install the MP Software folder into the Extensions folder on every PowerPC-based computer, no matter how many processors.

Turn off virtual memory and do not install RAM Doubler

Turn off virtual memory in the Memory control panel, and do not install Connectix RAM Doubler software. If virtual memory is turned on or RAM Doubler is installed, then your multiprocessor-compatible software applications will not be able to take advantage of the second PowerPC processor.

To turn off virtual memory, open the Memory control panel. In the Virtual Memory section, click the Off button. Then restart your computer. For more detailed information about virtual memory, see the topics on memory in Mac OS Guide, available in the Guide menu.

Turn off hard disk sleep

Make sure that the hard disk sleep interval is set to "Never" in the Energy

Saver control panel. Otherwise, software applications designed to work with your multiprocessor computer may not work properly.

To set your hard disk sleep interval, do the following:

- 1) Open the Energy Saver control panel.
- 2) If necessary, click Show Details to make the additional options available.
- 3) Drag the top and bottom sliders as shown below.

If you wish, you can set a display sleep interval by dragging the middle slider. Display sleep works properly with multiprocessor-compatible software applications.

Important information about Document Auto-Save

The Energy Saver control panel contains a feature named "Document Auto-Save." The purpose of this feature is to automatically quit all open applications during an idle or scheduled shutdown, while saving changes to any open documents in each application. Since there are literally thousands of applications available for the Mac OS (with new ones always arriving), we cannot guarantee that Document Auto-Save will be compatible with every application. This is especially true for any application that does not use standard routines to implement the alerts or dialog boxes used to save changes to new or modified documents. When Document Auto-Save is incompatible with an application, it will either not automatically quit, or it will display alerts or dialog boxes that Document Auto-Save does not recognize and therefore does not dismiss.

If you intend to turn Document Auto-Save on, we recommend that you monitor its operation during the first attempted idle or scheduled shutdown and note if any of your applications are not compatible. You can avoid problems with incompatible applications simply by making sure you leave open no documents that are new or modified before an idle or scheduled shutdown is to occur. Alternatively, you can modify the Document Auto-Save preferences in the Energy Saver control panel so the computer will sleep rather than shut down when unsaved documents are open.

For instructions for using Energy Saver & Document Auto-Save, choose Mac OS Guide from the Guide menu when the Finder is active.

Mac OS 7.6: About Open Transport 1.1.1 Read Me (1/97)

Article Created: 24 January 1997

TOPIC -----

This article is the About Open Transport 1.1.1 ReadMe file which comes with Mac OS 7.6.

DISCUSSION -----

Introduction

This document contains information about Open Transport compatibility, add-on software, and solutions to known problems with third-party software. For instructions about how to use the Open Transport control panels (AppleTalk and TCP/IP), see the networking topics in Macintosh Guide, available in the Guide menu when the Finder is active. For additional technical information about Open Transport, see the "Open Transport Technical Info" file.

What's new in Open Transport 1.1.1 - TCP/IP
Known limitations and other issues

Network interface options

Open Transport 1.1.1 supports PCI bus, NuBus, communications slot, and PC Card network interface cards, as well as built-in LocalTalk, Ethernet, and Token Ring network adapters. For computers without expansion options, Open Transport 1.1.1 also supports a SCSI-attached network adapter. Third party network interface

options available for Open Transport include Fast Ethernet, ATM, and FDDI.

General compatibility

Open Transport is compatible with:

- existing applications that use AppleTalk as specified by Apple Computer, Inc.
- existing applications that use MacTCP as specified by Apple Computer, Inc.
- existing devices (such as printers) that you select in the Chooser
- existing NuBus network interface cards for the Mac OS

Computers running Open Transport can be added to an existing AppleTalk or TCP/IP network without upgrading other computers on the network.

Apple product compatibility update

• At Ease version 2.x or 3.x may encounter problems when starting up with Open Transport. Apple has released an updater utility ("At Ease Basic OT Updater") on Apple Software Update sites on the Internet and selected online services. If you are using At Ease for Workgroups, you should upgrade to version 3.0.2.

• The Apple PCI Token Ring Card (M3904Z/A) requires Open Transport 1.1 or later. The Apple PCI Token Ring card is compatible with Power Macintosh 7500, 8500 and 9500 computers; it is not compatible with 7200/75 and 7200/90 computers.

• Apple LaserWriter Bridge and LocalTalk Bridge versions 2.1f2 or later are compatible with Open Transport.

• Apple Internet Mail Server 1.1 or later software is compatible with Open Transport 1.1 and later.

• Apple Remote Access (ARA) Multiport Server 2.1, ARA Client 2.0.1, and ARA Personal Server 2.0.1 are compatible with Open Transport 1.1 and later.

• Apple PCI-based Workgroup servers (Application, AppleShare, and Internet) are compatible with Open Transport 1.1.

• Computers running the current versions of Apple IP Gateway and AppleTalk Internet Router must not be updated to Open Transport; these products are based on classic networking. These products do, however, interoperate with computers using either classic or Open Transport networking. Apple has not yet announced plans regarding future versions of these products.

• Apple's MacTCP Ping is not compatible with Open Transport; no update is planned. MacPing from Dartmouth, available at <ftp://ftp.dartmouth.edu>, OTTool from Neon Software, available at <ftp://ftp.neon.com> and Mac TCP Watcher v2.0 from Peter N. Lewis & Stairways Software available at <ftp://ftp.share.com> are Open Transport-compatible alternatives.

• ZapTCP is not compatible with Open Transport.

Dialup network connectivity - TCP/IP

To connect to TCP/IP networks (including the Internet) using a modem, Open

Transport supports extensions known as "MDEVs." Serial Line Interface Protocol (SLIP) and Point to Point Protocol (PPP) connectivity are provided in this manner. Not all versions of all MDEVs are compatible with Open Transport 1.1 and later.

An Apple version of PPP 1.0, designed specifically to work with Open Transport, is provided with Mac OS 7.6. The following third-party MDEVs are also compatible with Open Transport. When properly installed, these MDEVs appear in the "Connect via" pop-up menu in the TCP/IP control panel.

- FreePPP - version 1.0.5 or later

FreePPP is shareware and can be found on the Internet, typically at "info-mac" mirror sites in the comm/tcp/conn directory. A list of info-mac mirror sites can currently be found at:

<<http://www.pht.com/info-mac/mirror-list.html>>

Some sites where FreePPP can be found currently include:

<<ftp://mirrors.aol.com/pub/info-mac/comm/tcp/conn/>>, and
<<ftp://mirror.apple.com/mirrors/Info-Mac.Archive/comm/tcp/conn/>>.

FreePPP versions prior to 2.5 may experience problems when running with virtual memory turned on (including RAM Doubler). If you have problems using FreePPP with virtual memory, either update to FreePPP 2.5 or turn virtual memory off when using FreePPP. The current version of FreePPP is 2.5rf.

- MacPPP - version 2.1.4 or later (MacPPP 2.5 is recommended)

MacPPP versions prior to 2.5 may experience problems when running with virtual memory turned on (including RAM Doubler). If you have problems using MacPPP with virtual memory, either update to MacPPP 2.5 or turn virtual memory off when using MacPPP.

- InterPPP - version 1.2.9 or later; InterPPP II - version 1.1 or later
InterPPP and InterPPP II are commercial software products. For availability and ordering information in the U.S., contact InterCon Systems at 800-468-7266 or 703-709-5500.

- MacSLIP - version 3.0.3 or later

MacSLIP is commercial software developed by Hyde Park Software. For availability and ordering information in the U.S., contact TriSoft at 800-531-5170 or 512-472-0744. For more details see the MacSLIP Web page at
<<http://www.zilker.net/~hydepark/>>

- Sonic PPP - version 1.0.2 or later

SonicPPP is commercial software developed by Sonic Systems, Inc. For availability and ordering information in the U.S., contact Sonic Systems at 408-736-1900 (voice) 408-736-7228 (fax). For more details see the Sonic Systems Web page at <<http://www.sonicsys.com/>>

- NTS PPP - 2.0 or later

NTS PPP is commercial software developed by Network Telesystems, Inc. For availability and ordering information in the U.S., contact Network Telesystems

at 408-523-8100 (voice) 408-523-8818 (fax). For more details see the Network Telesystems Web page at <<http://www.nts.com/>>

- SAT/SAGEM PPP - 1.02b1 or later

SAT/SAGEM PPP is commercial software developed by SAT/SAGEM. For availability and ordering information in the US, contact SAT/SAGEM at 408-446-8690 (voice) 408-446-9766 (fax). For more details see the SAGEM Web page at <<http://www.satusa.com/>>

- LeoTCP - 2.0.1 or later

LeoTCP is commercial software developed by Hermstedt GmbH. For availability and ordering information in the U.S., contact Hermstedt USA at 1-800-828-5522 (voice). In Europe contact Hermstedt GmbH at +49 621-76500 (voice) +49 621-7650100 (fax).

- T-Online CSLIP - version 1.0.3 or later

T-Online CSLIP is commercial software developed by Computer Consulting GbR. For availability and ordering information in Europe, contact format network & communication at 49 2206 95840. For more details, contact format network & communication at info@format.de.

- University of Michigan ISDN PPP - 2.0.6 or later

- OT/PPP - version 1.0f1c9 or later

In addition to these, there are a number of other MDEVs (examples include those from Pacer, FCR, and Tribe) which are indistinguishable from one another to Open Transport. When installed, these appear in the "Connect via" pop-up menu as "TCP/IP PPP."

Tips for SLIP and PPP configurations

- Some MDEVs are known to be incompatible with other MDEVs. If you experience problems, remove unused MDEVs so that only one MDEV is installed on your computer at a time.
- Users who dial into a TCP/IP network or Internet Service Provider (ISP) may have been assigned a router (gateway) address that is not a part of their local subnet. This was an accepted but technically invalid configuration for MacTCP. Open Transport users should not enter a value for the router address or subnet mask; Open Transport/TCP generates correct values for these fields automatically. In unusual circumstances, you can override the supplied values using the Administration mode of the TCP/IP control panel.
- If BootP is used over SLIP or PPP for interface configuration, and if BootP returns additional default router addresses, Open Transport will automatically add those addresses to the list of default routers.
- When Open Transport is installed on a computer that previously had MacTCP configured for a server configuration, the initial configuration method -- the selection in the "Configure" pop-up menu in the TCP/IP control panel -- is set for the use of a BootP server. This default may not be the appropriate choice for you; please verify.

- If your computer was previously configured for MacTCP "server" addressing and you experience connection difficulties using PPP or SLIP after installing Open Transport, follow these steps:

- 1) Open the TCP/IP control panel.
- 2) Choose Using PPP Server or Using SLIP from the Configure pop-up menu.
- 3) Close the TCP/IP control panel and save changes when prompted.
- 4) Try connecting again.

- If your computer was previously configured for MacTCP "manual" addressing and you experience connection difficulties using PPP or SLIP after installing Open Transport, follow these steps:

- 1) Open the TCP/IP control panel.
- 2) Choose Manual from the Configure pop-up menu.
- 3) Verify that the correct IP address is entered in the Address field.
- 4) Close the TCP/IP control panel, and save changes when prompted.
- 5) Open the configuration utility supplied with your SLIP or PPP software, and verify that it also reflects the correct IP address in the appropriate location. Refer to the documentation supplied with your SLIP or PPP software for further information on how to enter an IP address, and how to save an updated configuration.
- 6) Try connecting again.

Note: In MacPPP's ConfigPPP control panel, this setting is entered in the IPCP dialog box. Refer to the documentation that came with MacPPP or FreePPP for additional information.

What's new in Open Transport 1.1.1 - general

- Memory management is improved. On PowerPC-based computers, memory is no longer fragmented. On 68030 or 68040 computers that turn on the "Load only when needed" option, memory will not unfragment for 2 minutes after a TCP application completes.
- Performance enhancements for opening and closing endpoints have been added. This is particularly visible on Mac OS computers that are busy Web servers.
- Open Transport now registers and unregisters CRM serial drivers.
- The NuBus version of the DOS Compatibility Card is compatible with Open Transport 1.1.1.
- Infrared-compatible versions of LocalTalk drivers are now installed on all models. Previously these drivers were only installed on portable computers.

What's new in Open Transport 1.1.1 - AppleTalk

- AppleTalk now properly handles Phase I RTMP packets on LocalTalk. This was causing problems using EtherPrint, TeleBridge, and other third-party forwarding technologies.

- Fixed a problem on a PowerBook Duo where AppleTalk would awaken from sleep on the wrong port when docking with an Ethernet MicroDock.
- Fixed a problem in ARA compatibility where Open Transport would sometimes not get the complete zone list from the server.
- Fixed some problems in ARA compatibility where a packet would not get routed properly, causing computers attached to the local cable of the server not to be visible to the ARA client.
- When using ADEVs, Open Transport requests a specific address from the ADEV. Some ADEVs return no error, but modify low memory locations to indicate a different address than that requested. Open Transport now picks up that different address and uses it (however, if the User Defined option is turned on, AppleTalk will not open).
- Some Ethernet-ISDN bridges used for remote LAN-to-LAN connectivity drop the connection when there is no active data transfer, and dial on demand when there is information to be transferred. If a user's local network does not include an AppleTalk router, a message appears each time the connection is dropped. Use the AppleTalk Options control panel to fix the problem. Open the control panel, turn on the "Suppress router-related alerts" option, then close the control panel.

What's new in Open Transport 1.1.1 - TCP/IP

----- Server-specific fixes and enhancements

- The performance of opening and closing TCP endpoints has been improved. This improvement will be most noticeable on servers with a high volume of short-duration connections (such as Web servers).
- In OT 1.1, sometimes TCP connections could not be reused. Eventually a server application would not be able to accept incoming connections. This has been fixed.
- Fixed a problem where busy TCP servers sometimes accepted no new inbound connections for about 30 seconds every 4 minutes.
- Fixed a memory leak which occurred when Hosts files were used and TCP/IP was set to "load only when needed." Previously, Hosts file entries were not properly deleted from memory when TCP/IP unloaded.
- Introduced a better DNR cache limitation algorithm. Entries that haven't been used for 15 minutes can now be flushed whenever the DNR is heavily used.

Other TCP/IP fixes and enhancements

- Open Transport's MacTCP compatibility now honors the pushFlag parameter to TCPSend call. This is required for some legacy applications to correctly communicate with older, nonconforming hosts. However, no direct control of the TCP pushFlag is or will be provided through the native OT API.
- Entries in the Address and Alias caches now flush when they reach

their "time-to-die," and not when they exceed it. TCP/IP also no longer caches resource records with a 0 time to live.

- The DNR now more robustly supports service load-balancing strategies. It no longer maps directly between an alias and the IP address of the host being aliased.
- When dealing with DHCP servers, Open Transport now tries "full-size" packets first, then falls back to "short" packets.
- Fixed a problem with timer overflow on long DHCP leases. Previously, if the lease exceeded 24 days, then TCP/IP connectivity would be lost in a matter of hours.
- Fixed a problem that occurred when one end of a connection closes a "tcp" endpoint, while the other end simultaneously aborts the connection.
- Fixed a problem where a DNR SysInfo request will sporadically fail when a valid reply is mistakenly treated as having been truncated.
- Fixed a hang that occasionally occurred when flushing the DNR address cache.
- Fixed a problem where resolving a bad name sometimes returned no error, when in fact an error occurred.
- Fixed a hang that occurred with applications that use the TCPNoCopyRcv call through the MacTCP compatibility interface. This hang occurred when the MacTCP compatibility interface ran out of memory, either due to being given a small buffer by the application, or by receiving enough inbound data to fill most of the inbound buffer space.
- Fixed a memory leak when opening the resolver in MacTCP emulation mode.
- Open Transport 1.1.1 is compatible with NuBus Token Ring adapters. To ensure compatibility with existing NuBus Token-Ring drivers, Open Transport TCP/IP artificially imposes a MTU of 1500 bytes. This limit should be addressed in a future release.
- Open Transport's MacTCP emulation can now abort a connection where the underlying stream is blocked due to flow control. Applications using the native Open Transport API will have to issue an I_FLUSH ioctl before sending a disconnect when they want to disconnect/abort a flow-controlled connection.
- A new traceroute program for Open Transport/TCP, called "WhatRoute," is now available at <<http://crash.ihug.co.nz/~bryanc/>>. The latest version of Mac TCP Watcher (v2.0) <<ftp://ftp.share.com/peterlewis/>> also now supports traceroute.

Known limitations and other issues

-
- The AppleTalk control panel displays separate printer and modem ports on the PowerBook 190. LocalTalk will only work correctly when the modem port is selected in the AppleTalk control panel.
 - The software that dims the screen of PowerBook Duo computers when the PowerBook is docked and idle is not compatible with Open Transport. Use a third-party screen saver instead of the Apple-provided module.
 - In some cases, on a PowerBook 190 configured to use the infrared port in the AppleTalk "Connect via" pop-up menu, networking services may become disabled following a sleep/wake or restart. If this happens, try putting the computer to sleep and waking it up again, or use the AppleTalk control panel to temporarily select the modem/printer port before switching back to the infrared port.
 - On a IIfx or a Quadra 950, Open Transport can only use the "compatible mode" setting in the Serial Switch control panel. Don't use the "faster mode" setting with LocalTalk.
 - On 68030 and 68040 computers, changes in AppleTalk configurations can cause systems running Meeting Maker 3.5 or 3.5.1 to crash. This can occur when changing AppleTalk links, turning AppleTalk off, or bringing Apple Remote Access connections up or down. This problem will occur on classic networking as well. Apple is working with ON Technology to resolve this problem.
 - Open Transport generally requires more memory (RAM) than MacTCP. To conserve memory, you might try some of the following:
 - Rename or re-order one or more third-party system extensions (INITs), to change the order in which memory is allocated when your computer starts up. If you use extensions from Global Village, try renaming those extensions so that they load last.
 - Especially on PowerPC-based computers, turn on virtual memory.
 - When TCP/IP is set to "Load only when needed" (in the control panel's Options window), "pinging" an Open Transport workstation will fail if TCP/IP is not currently being used. To make sure your computer is "pingable" at all times, turn off the "Load only when needed" option (open the TCP/IP control panel and click the Options button, then click the "Load only when needed" checkbox to remove the X) and restart your computer.
 - When TCP/IP is set to "Load only when needed" (in the control panel's Options window), the first TCP/IP application opened will cause Open Transport to load into memory. Some older applications don't cause Open Transport to load, and then report errors similar to those encountered when MacTCP is not installed. If this is a problem, turn off the "Load only when needed" option (open the TCP/IP control panel and click the Options button, then click the "Load only when needed" checkbox to remove the X) and restart your computer.
 - The TCP/IP control panel is able to obtain and utilize multiple gateway and name server addresses from DHCP and BootP servers. However, it will currently display only the first one. This should be addressed in a future release.
 - Generally, you should turn on the "Load only when needed" option in the TCP/IP

control panel when using a modem. If TCP/IP is always loaded, your modem may attempt to initiate a dialup connection at startup. Some MDEVs require more system heap memory than is available at startup, which may cause the computer to hang. Also, some Internet service providers charge by connect time, so you may be charged for the connection, even if you weren't using it.

- If you use MacSLIP, you should likewise not configure the MacSLIP control panel to initialize MacSLIP at system startup time. As stated above, this may require more system heap memory than is available at startup, which may cause the computer to hang.
- If you are experiencing problems when using MacSLIP with virtual memory on, increasing your virtual memory size may give you better results. (Use the Memory control panel to increase virtual memory.)
- If you are using Netscape, 16 MB or more of built-in memory (RAM) is recommended.
- Some MacTCP-based applications will not function correctly unless the MacTCP DNR file is in its original location at the root level of the System Folder. Do not delete this file when installing or configuring Open Transport.
- You should only specify use of 802.3 framing in the TCP/IP control panel if you have been directed to do so by your network manager, or if you are sure that all other stations on your network segment, including your IP router(s), are also configured to use 802.3 and not Ethernet version 2.0 framing.
- Claris EMailer version 1.1 v3 or later is compatible with Open Transport 1.1.1. Earlier versions of Claris EMailer may not be compatible with Open Transport's "Load only when needed" configuration option. If you experience a system crash 2-3 minutes after quitting EMailer, turn off the "Load only when needed" option. (Open the TCP/IP control panel and click the Options button, then click the "Load only when needed" checkbox to remove the X.)
- The current version of the MacTraceRoute Ethernet LAP does not work on computers running Open Transport.
- NFS/Share versions 1.4.4 or later are compatible with Open Transport.
- When using Netware Client version 5.11 configured for NetwareIP service, the first login may yield a Netware Configuration error message. To avoid this error, open the NetwareIP control panel and change the value under Domain SAP Server (DSS) Retry Attempts from 1 to 2. You can also change Open Transport TCP/IP control panel to always load TCP/IP into memory (open the TCP/IP control panel, click the Options button, and click the "Load only when needed" box to remove the X).
- eXodus 5.2.2 and later are compatible with Open Transport.
- Versions of Anarchie prior to 1.6 have a data corruption problem when used with Open Transport. Make sure you are using Anarchie 1.6 or later.
- If an Apple Remote Access (ARA) user is on a non-routed, extended (Ethernet)

network, and there are devices on the local network with the same network number as devices on the remote network, the user won't be able to see the local devices. This problem can be fixed by installing a router. Another workaround is to clear the PRAM on the ARA computer. (Hold down the Control, Option, and P keys simultaneously while starting up the computer). Clearing PRAM causes the computer to start up with a new network number, which should not conflict with the remote network number.

- Daemon 1.0.0 & Daemon Killer 1.0 are not compatible with Open Transport.
- MudDweller 1.2 is not completely compatible with Open Transport. You can open new connections, but the "reconnect" choice does not work correctly.
- The system will crash during launch of NetPresenz if Open Transport TCP/IP is configured to use MacIP and the selected zone has no MacIP server.
- Current versions of VersaTerm SLIP are not compatible with Open Transport.
- Problems can occur with old versions of the KeyServer package from Sassafras Software when TCP/IP is configured to "Load only when needed" (in the control panel's Options window). Contact Sassafras for the latest revisions at <<http://www.sassafras.com>>.
- The combination of Open Transport 1.1.1, LocalTalk Bridge 2.1f2, Global Village Toolbox and GlobalFax extensions causes a crash. The workaround is to move the LocalTalk Bridge file to the Extensions folder, renaming it to "aLocalTalk Bridge." You can make an alias and rename the alias as desired. Put the alias wherever you want, including the Control Panels folder. This will allow the LocalTalk Bridge to load before Global Village and avoid the cause of the crash.
- To use the CSI Hurdler serial card with Open Transport, contact CSI to get a copy of their preference file patch. This will enable the card to be compatible with Open Transport 1.1.1.
- After installing Open Transport 1.1.1 over a network while using Classic AppleTalk, open the Open Transport 1.1.1 AppleTalk control panel. If you are not using an infrared device, open the "Connect via" pop-up menu and choose Serial Port.
- The current official release of the MPW shell will hang the system when used with virtual memory and Open Transport. When using the MPW shell and Open Transport, turn off virtual memory. The ETO #21 pre-release MPW shell, version 3.4.2b2, fixes this problem.

Mac OS 7.6: About QuickDraw GX Read Me (1/97)

Article Created: 24 January 1997

TOPIC -----

This article is the About QuickDraw GX ReadMe file which comes with Mac OS 7.6.

DISCUSSION -----

About QuickDraw GX

This document includes information about new features of version 1.1.5 of QuickDraw GX, as well as tips and compatibility information. It also includes information about obtaining printer and fax drivers for use with QuickDraw GX. This document also contains information about using fonts with QuickDraw GX.

For the latest information about applications, utilities, fonts and printer drivers, see the Web site at <http://www.macos.apple.com/macos/tech.html>.

Compatibility Information
=====

QuickDraw GX and WorldScript II

Make sure that you are using WorldScript II version 7.2 or later.

QuickDraw GX and At Ease

Make sure that you are using At Ease version 2.0.3 or later.

Installing QuickDraw GX with the Power Macintosh Upgrade Card

When you install QuickDraw GX on a computer with the Power Macintosh Upgrade Card, make sure that the upgrade card is enabled before installing QuickDraw GX.

Manual Feed and the LaserWriter IISC GX Driver

When you print a manual feed job to a printer using the LaserWriter IISC GX driver, wait for the manual feed alert to appear before inserting the next page. If you insert the page before the alert appears, your printer will print the first page twice and then stop printing. Opening and closing the cover on your printer will clear it.

QuickDraw GX and Application Programs

-
- In application programs which do not take advantage of QuickDraw GX, Tekton Plus appears as two fonts: Tekton Plus Regular and Tekton Plus RegularSC. Applications such as Adobe Illustrator, QuarkXPress, and Aldus PageMaker print characters from Tekton Plus RegularSC as Courier on PostScript printers.
 - If possible, do not use the QuickDraw GX Helper (to turn off desktop printing) with WordPerfect versions 3.0 and earlier. In WordPerfect, when you turn desktop printing off, the third item on the Apple menu (which corresponds to the first alphabetic item in the Apple Menu Items folder) opens. WordPerfect versions 3.1 and later are compatible with QuickDraw GX.
 - In PageMaker version 5.0, documents containing PICT files will print without the PICT files and an extra blank page may be printed at the end of some documents. To print correctly, hold down the Option key when you choose Print from the File menu.
 - To print on a PostScript printer using Insignia Solutions SoftPC and SoftWindows versions earlier than 1.0.2a, you must turn off desktop printing or use the Epson LQ-2500 output option. To turn off desktop printing, use the QuickDraw GX Helper (one of the QuickDraw GX Utilities). You can install the QuickDraw GX Utilities with the custom installation option of QuickDraw GX. SoftWindows versions 1.0.2a and later are compatible with QuickDraw GX.
 - Adobe Acrobat Reader versions earlier than 2.0.1 and all versions of Adobe Acrobat Exchange are incompatible with QuickDraw GX 1.1.5. A compatible version of the Acrobat Reader is available in the Utilities folder on the Mac OS 7.6 CD-ROM disc.
 - The substitution fonts included with Adobe Illustrator 5.5 and SuperATM are not compatible with QuickDraw GX 1.1.5. If you install QuickDraw GX 1.1.5 on a computer where these substitution fonts have already been installed, you will see this message: "The substitution fonts necessary for Acrobat and SuperATM are missing. Please re-install either software package." QuickDraw GX-compatible versions of these fonts are available as part of the Adobe Acrobat Reader, version 2.0.1, available in the Utilities folder on the Mac OS 7.6 CD-ROM disc.
 - You should print documents that use the Al-Nashir Al-Sahafi font (Arabic Design Studio) on raster (non-PostScript) printers. If you try to print an Al-Nashir Al-Sahafi document on a PostScript printers, no document will print.

QuickDraw GX Printer Driver Upgrade Information

=====

To print with QuickDraw GX, you need a QuickDraw GX printer driver for your printer.

- If you have an Apple printer, QuickDraw GX versions of your printer drivers are installed with QuickDraw GX.
- If you have a non-Apple printer, check with your Apple-authorized dealer or contact your printer vendor directly to obtain a GX driver for your printer. See the list below for vendor information.

CalComp

PostScript compatible printers from CalComp should work with the standard LaserWriter GX PostScript driver. If you have any problems using QuickDraw GX with CalComp products and are within the United States or Canada, call CalComp at 800-451-7568. Outside the United States or Canada, contact the office in your area as listed in an appendix of your printer manual.

Epson America

For information about Epson QuickDraw GX drivers, call the Epson End User Support Center at 1-800-922-8911.

GCC Technologies

For information about GCC QuickDraw GX drivers and upgrade information contact GCC Technical Support at one of these numbers:

Phone Number: 617-276-8620
Fax Number: 617-275-1115
CompuServe: 67004,2302
GEne: GCC.TECH
America OnLine: GCC TECH

GDT Softworks Inc.

For upgrade information about GDT Softworks products (PowerPrint 2.5, PowerPrint/GX 3.0, PowerPrint/LT 3.0, PowerPrint/NW 3.0, PLOTTERgeist 3.0, PowerPlot 2.0, PowerPlot/LT 2.0, StyleScript 2.0), contact GDT:

GDT Softworks Inc.
Customer Service Upgrades
4664 Lougheed Highway, Suite 188
Burnaby, BC V5C 6B7 Canada

Phone Number: 1-800-663-6222 or 604-291-9121
Fax Number: 604-291-9689
CompuServe: 72137,3246
Internet: customer_service@gdt.com

Hewlett-Packard

If you need Post-Sale Assistance, Technical Assistance, or if you have any kind of questions about H-P peripherals, contact the HP Computer Products Customer Support Center at 208-323-2551.

For users of Hewlett-Packard printers, the fastest way to get a QuickDraw GX printer driver is from one of these electronic online services:

CompuServe: HP Peripherals forum (HPPER)

Library 9

Internet: FTP to IP address 192.6.71.2

Name - Anonymous

Password - Send User Identification

HP Download Service: 208-344-1691

(modem settings: parity, N; data bits, 8; stop bits, 1)

To receive detailed instructions on accessing these online services, contact HP FIRST, Hewlett-Packard's document FAX retrieval service: Inside the U.S. and Canada: 1-800-333-1917 (Then press 1 for HP FIRST.) Outside the U.S. and Canada: 208-344-4809

To receive a disk with the QuickDraw GX printer driver, contact the HP Software Distribution Center at 303-339-7009. A nominal charge for materials and shipping applies.

Kodak

Call 1-800-CDKODAK for technical support. To update EKC drivers and print utilities, connect to CompuServe and 'go kodak'. In the Library menu, choose Browse. In the Browse sections, choose Kodak Printers. You can download these upgrades from CompuServe.

Lasermaster

For QuickDraw GX driver updates from Lasermaster, call Lasermaster Technical Support at 612-944-8509.

Lexmark International

Lexmark/IBM customers can get the latest QuickDraw GX drivers from:

Technical Support: 606-232-3000

Lexmark Bulletin Board: 606-232-5238

Internet: anonymous ftp at ftp.lexmark.com

CompuServe: Go Lexmark

Microspot

For information about MacPlot Raster GX and MacPlot Pen Plotter Professional GX drivers or upgrade information, contact the Sales Department:

Microspot

12380 Saratoga-Sunnyvale Road, Suite 6

International Customers: Please contact your local Tektronix office

Xerox

Xerox offers QuickDraw GX printer drivers for Xerox DocuTech Network Publisher
Model 90 and Xerox DocuTech Network Publisher Model 135. For information on how
to obtain the driver, customers can send an electronic mail message to:

GX.Roch817@Xerox.com

QuickDraw GX Fax Information

=====

To fax with QuickDraw GX, you need a QuickDraw GX fax driver for your modem. Use the information below to contact the vendor about a fax driver for your modem.

Apple Telecom software

A version of Apple Telecom that supports GX is included with Mac OS 7.6.

Global Village

GlobalFax version 2.5 supports QuickDraw GX. If you purchase a modem that includes GlobalFax 2.5 software, it will automatically install the GlobalFax GX fax driver as part of the standard installation. If you are using an older version of GlobalFax software, you can buy a GlobalFax 2.5 Upgrade from Global Village by calling 1-800-736-4821 or 1-408-523-1036. For more information about GlobalFax software, check Global Village forums on the following online services:

America Online: global

CompuServe: go global

Global Village BBS: 415-390-8334

Web: <http://www.globalvillag.com>

Cypress Research

If you use Cypress Research FaxPro II, call 408-752-2700 and ask for Technical Support.

STF Technologies

For information about the FaxPrint GX printer driver, contact STF Customer Service:

Phone Number: 816-463-2021

Fax Number: 816-463-7958

Bulletin Board: 816-463-1131

CompuServe: 74740,1244 (Go STFtech)

America Online: STFtech

Using Fonts

=====

Type 1 Fonts Enabled During Installation

During installation, QuickDraw GX enables any Type 1 fonts found in the System Folder, the Fonts folder, or the Extensions folder. However, you must ensure that each Type 1 font family is in its own suitcase. The Installer will not

enable multiple font families contained in one suitcase.

Adobe Type Manager version 3.8.3

ATM version 3.8.3 is installed with this version of QuickDraw GX. ATM 3.8.3 includes native support for computers with PowerPC microprocessors.

Type 1 fonts will display and print properly only if ATM is installed and turned on. As with previous versions, ATM 3.8.3 rasterizes Type 1 font data from the POST resource in conventional outline font files (file type LWFN). In addition, ATM 3.8.3 rasterizes Type 1 font data from the 'sfnt' resource in suitcase files (file type FFIL). ATM 3.8.3 does not include font substitution capability.

Enabling Type 1 Fonts After Installation

You may need to enable Type 1 fonts after you install QuickDraw GX. To enable Type 1 fonts, use the Type 1 Enabler, one of the QuickDraw GX Utilities. Each Type 1 font family must be in its own suitcase before using the enabler.

To install the QuickDraw GX Utilities, use the custom installation option with QuickDraw GX. For more information, see your Mac OS installation manual.

The Type 1 Enabler supports only Type 1 fonts. If the Type 1 Enabler program encounters a suitcase containing Type 3 fonts, it displays the message "Contains a Type 3 font program" and does not enable the suitcase.

The Type 1 Enabler does not enable hybrid fonts. Old versions of Optima or ITC Eras fonts are hybrid fonts. If you are a registered owner of Optima or ITC Eras, call Adobe Systems Technical Support to obtain an upgrade to the non-hybrid versions of these families.

Removing Duplicate Fonts

To make sure that QuickDraw GX properly manages currently installed fonts, you should make sure you have no duplicate fonts installed in the System Folder. Remove any duplicates that you find.

Restoring Type 1 Fonts to Their Original State

If you remove QuickDraw GX from your system, you need to restore your Type 1 fonts. To restore Type 1 fonts, follow these steps:

- 1) Open the System Folder.
- 2) Open the Fonts folder.
- 3) Drag any suitcases that have been enabled to the Trash.
- 4) Open the •Archived Type 1 Fonts• folder.
- 5) Move the contents of the •Archived Type 1 Fonts• folder to the Fonts folder.
- 6) Drag the •Archived Type 1 Fonts• folder to the Trash.

Tips

====

Envelope Paper Types and the LaserWriter GX Driver

The LaserWriter GX printer driver handles three types of No. 10 envelopes. However, each of the three types is designed for a different type of LaserWriter printer. Your choice of envelope should be based on how your printer feeds envelopes from the paper input tray:

- "Envelope - Center Fed" is for printers that feed the envelope in the center of the paper input tray.
- "Envelope - Edge Fed" is for printers that feed the envelope on the left edge of the paper input tray.
- "No. 10 Envelope" is for certain new printers (for example, the LaserWriter 16/1600PS) that use a different method of determining paper size.

Mac OS 7.6: About QuickDraw 3D Read Me (1/97)

Article Created: 24 January 1997

TOPIC -----

This article is the About QuickDraw 3D ReadMe file which comes with Mac OS 7.6.

DISCUSSION -----

Important Information About QuickDraw 3D

QuickDraw 3D enables your Macintosh computer to display three-dimensional graphics using applications designed to take advantage of QuickDraw 3D. It also provides a common file format, called 3DMF (for "3D metafile"), for exchanging 3D documents, and acceleration services which support plug-and-play accelerator cards.

The following are required to install and run QuickDraw 3D:

- a PowerPC based computer with a minimum of 16 megabytes of memory (RAM)
- MacOS System 7.1.2 or later

Using QuickDraw 3D

The QuickDraw 3D folder includes the following applications, 3D models, and textures that allow you to explore the 3D capabilities of your Macintosh:

- SimpleText version 1.3.1 and Scrapbook version 7.5.1. These applications allow you to open and interact with 3DMF models.
- A new Scrapbook File with sample 3DMF models.
- A number of 3DMF models provided by Model Masters and Viewpoint Datalabs International.
- Textures provided by Wraptures and Xaos Tools.

You can expect more applications using QuickDraw 3D in the near future, including new versions of application programs you may already own. Contact your software vendors for more information about their plans to support this new technology.

QuickDraw 3D performance and image quality

For better performance, we recommend that Virtual Memory be turned off.

QuickDraw 3D has been optimized to display three-dimensional graphics of high quality. To display high-quality images, and obtain the best performance from your system, we recommend that you set your system to display thousands or millions of colors.

Troubleshooting

If you try to start an application that uses QuickDraw 3D and get the message "The application '<application name>' could not be launched because QuickDraw 3D could not be found," make sure that the following files are in the Extensions Folder, inside the System Folder:

- QuickDraw 3D
- QuickDraw 3D Accelerator
- QuickDraw 3D Viewer

If the files are there and you still get the message, it means that you don't have enough memory to run the application. You may be able to open the application if you try the following:

- Quit other open applications.
- Reduce the amount of memory allocated to the application. This is done by:
 - selecting the application's icon in the Finder
 - choosing "Get Info..." from the File menu
 - typing a lower number in the boxes for Minimum Size and Preferred Size
- Install more memory (RAM).

If you are using a localized system, and you install this U.S. software, you will need to copy the "Scrapbook File" in the "QuickDraw 3D Folder" to the System Folder on your Macintosh. Otherwise, when you select the Scrapbook from the Apple menu, you will get an empty scrapbook. Note that this operation will replace any existing Scrapbook File in the System Folder, thus erasing any previously stored contents.

Some of the sample models included with QuickDraw 3D, such as Big Ben and Red Hatchback, are highly detailed (they contain additional 3D modeling data such as vertex normals and surface UVs) and thus will require a larger amount of memory than the other supplied models. If you experience problems when opening these files from SimpleText, you should open only one file at a time.

How QuickDraw 3D uses memory

QuickDraw 3D is a shared library. When no applications that rely on QuickDraw 3D

are open, the library does not take up memory space (RAM). Once a QuickDraw 3D-based application is open, the amount of memory taken up by the shared library doesn't increase if other QuickDraw 3D-based applications are launched. Of course, each application will take up memory according to their size and the complexity of the files being used. The memory taken up by QuickDraw 3D becomes available when you quit all QuickDraw 3D-based applications.

While a QuickDraw 3D application is open, the QuickDraw 3D library allocates memory from "temporary memory." This memory shows up in the "About This Macintosh..." window as memory used by the System. When you quit the application, the memory becomes available, but the size shown in the "About This Macintosh..." window may not reflect this. The memory previously used by QuickDraw 3D is, nonetheless, available for other applications (it is released to the applications as needed).

If you need to reinstall QuickDraw 3D

If you need to reinstall QuickDraw 3D, follow these steps:

- 1) Open the "QuickDraw 3D Install" folder and double-click the Installer icon.
- 2) After installing QuickDraw 3D, restart your computer.
- 3) If you want the items in the "QuickDraw 3D Extras" folder, drag the folder to the newly-created "QuickDraw 3D Folder" inside the "Apple Extras" folder.

Removing QuickDraw 3D

If you wish to remove QuickDraw 3D, follow these steps:

- 1) Open the "QuickDraw 3D Install" folder and double-click the Installer icon.
- 2) Choose Custom Remove from the pop-up menu.
- 3) Click the box next to each item to put a check in it.
- 4) Click Remove.
- 5) Restart your computer.

Mac OS 7.6: About the 5XXX/6XXX Tester Read Me (1/97)

Revised: 1/24/97
Security: Everyone

Mac OS 7.6: About the 5XXX/6XXX Tester Read Me (1/97)

Article Created: 24 January 1997

TOPIC -----

This article is the About the 5XXX/6XXX Tester ReadMe file.

DISCUSSION -----

About the 5XXX/6XXX Tester

This document describes the 5XXX/6XXX Tester application. This application checks Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers for hardware problems that may cause the computer to freeze. The tester only works on Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers.

IMPORTANT: The Power Macintosh or Performa 6360 does not have this hardware problem. If you have a Power Macintosh or Performa 6360, you do not need to use the tester program.

If you are experiencing problems with your computer other than system freezing, you should contact an Apple-authorized service provider to obtain a full diagnostic test.

How to use the tester application

To use the tester application, double-click its icon.

After the tester has checked your computer, you'll see a message. If the message indicates that a problem has been found, contact an Apple-authorized service provider or Apple customer support to have your computer repaired. The necessary repairs are covered under a repair extension program.

Mac OS 7.6: About the Control Panels Folder Read Me (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

This article is the About the Control Panels Folder ReadMe file.

DISCUSSION -----

Mac OS 7.6
What's Inside the Control Panels Folder?

About this document

If you're curious about the contents of the Control Panels folder, this document provides a brief description of each control panel. You can use these descriptions to help determine which control panels you may need and which ones you may not need.

What is a control panel?

A control panel is a small piece of software that allows you to change your computer's settings to meet your needs. For example, you can change the pattern or color of your computer's desktop using the Desktop Patterns control panel.

You can use the Extensions Manager control panel to turn off any control panel you don't need on your computer.

Depending on the type of computer you have, the contents of your Control Panels folder may vary. You might also have control panels that were added by third-party applications. For complete instructions on using control panels, see Macintosh Guide, available in the Guide (question mark) menu when the Finder is the active program.

Apple Menu Options: You can turn the submenus available in the Apple menu (for recently used documents, programs and servers) on or off. You can also set the number of items that will appear in the menus.

AppleTalk: You can specify AppleTalk settings (such as connection port and zone) for use with Apple's Open Transport networking.

ATM: Makes your Type 1 fonts look sharp and clear at any point size—both on your screen and on paper. Improves the output of QuickDraw printers, such as the ImageWriter and StyleWriter series.

Auto Power On/Off: You can specify dates and times for your computer to automatically turn on or off, set a warning interval before turning off, and specify that your computer automatically restart after a power failure. Works only on computers that can be turned on from the keyboard (does not work on Macintosh PowerBook 500 models).

AutoRemounter: You can turn off the Losing Network Services message that appears when your PowerBook sleeps. You can also automatically reconnect your computer to any shared disks that were disconnected when your PowerBook went to sleep. Works on all Macintosh PowerBooks except models 100, 140, 145, 145B, and 170.

Button: You can disable the built-in volume and contrast buttons on the front of your computer. Useful in classroom situations with young students. Works on the Macintosh Performa and Macintosh LC 500 series of computers.

Cache Switch: You can turn processor caching on or off. For compatibility reasons, processor caching may need to be turned off for some applications. Works on computers with 68040 processors, such as the Macintosh Quadra, Macintosh Centris, and Performa 400/500 models.

Color: You can set the color of highlighted text and window borders.

CloseView: You can magnify your computer display for easier viewing.

ColorSync System Profile: Part of the ColorSync system that provides consistent color across various types of equipment (printers, scanners, monitors, and so on). In the control panel, you can view and select ColorSync profiles for the types of equipment you use.

Control Strip: You can display or hide the Control Strip, and specify a font for Control Strip menus. With the Control Strip, you can control a variety of settings directly from your desktop, such as sound volume, monitor resolution, file sharing, and so on.

Date & Time: You can set the date, time, and time zone on your computer. You can also set how dates and times are displayed.

Desktop Patterns: You can change the pattern or color of your computer's desktop.

Easy Access: You can press keys used in keyboard combinations one at a time (Sticky Keys), move the pointer using the numeric keypad (Mouse Keys), and set typing speed with audible response (Slow Keys).

Editor Setup: You can specify which OpenDoc parts to use for different kinds of

file formats.

Extensions Manager: You can turn your computer's system extensions on or off. Extensions include items in the Extensions folder, control panels, and other startup programs in the System Folder.

File Sharing Monitor: When file sharing is turned on, this control panel displays a list of users who are connected to your computer.

General Controls: You can set various options, including desktop hiding, Launcher visibility at startup, folder protection to prevent folders and files from being deleted, insertion point blinking rate, menu selection blinking, and the default folder that appears in the Save dialog box.

Keyboard: You can set the repeat rate and delay before repeat for your keyboard. Also lets you switch keyboard layouts.

Labels: You can customize the color and text of icon labels.

Launcher: You can open the Launcher window, where you can easily find and open programs. You can add items to the Launcher by placing an alias to your favorite applications, files, or folders in the Launcher Items folder in the System Folder.

Mac OS Open: You can customize the way documents are translated into alternate applications, so you can open a document when you do not have the application that was used to create the document.

Map: You can locate popular cities around the world, and display longitude and latitude coordinates and local time. Lets you set the location of your computer.

Memory: You can control memory settings, including disk cache, virtual memory, and RAM disk configuration. Do not remove this control panel if you use a RAM disk.

Monitors: You can set the number of colors or shades of gray that are displayed. Sets monitor resolution for multiple scan monitors. On some computers, the Monitors control panel is replaced by the Monitors & Sound control panel.

Monitors & Sound: A combined control panel that replaces the separate Sound and Monitors control panels. (It also replaces the Sound & Displays control panel.) You can use this control panel to specify information about monitors attached to your computer (for example, monitor resolution, monitor bit depth, monitor arrangement, and so on). You can also use this control panel to specify information about other audiovisual equipment attached to your computer (for example, audio CD players, VCRs, video cameras, external speakers, and so on.) Works on PowerPC-based computers with PCI slots.

Mouse: You can set the tracking speed and double-click speed for your mouse.

Numbers: You can control how numbers and currencies are displayed on your computer (for example, where decimal points appear).

PC Exchange: Allows your computer to read files from ProDOS and MS-DOS disks. You can specify the Mac OS application program used to open a DOS document. You can also use SyQuest and Bernoulli disks on your desktop.

PC Setup: You can set options for the DOS Compatibility Card. Works on all that support the DOS Compatibility Card.

Power Macintosh Card: Used with 68040-based Mac OS computers that have an expansion card with a PowerPC processor. You can select which processor to use. Works on all computers with a Power Macintosh Upgrade card.

PowerBook: You can set portable-specific items, including hard disk sleep, system sleep, and screen dimming. You can also set processor cycling and (on certain computers) reduced processor speed. Controls backlight intensity and built-in video. Works on all portable computers.

PowerBook Display: You can duplicate the images on your portable computer's display on an external monitor. Useful for controlling a presentation from your portable while displaying the presentation on a large room monitor. Works on Macintosh PowerBook 160, 165c, 180, 180c, 200, and 500 models.

PowerBook Setup: You can set a unique SCSI ID number for your portable computer for use with SCSI disk mode. You can also specify a Normal or Compatible modem setting for your PowerBook. Use Normal for communication applications that are compatible with the Macintosh Communications Toolbox. Use Compatible for communication applications that are not compatible with the Communications Toolbox. Works on all Macintosh PowerBook 200 and 500 models.

QuickTime Settings: You can set options for MIDI instruments, and set a CD to play automatically when inserted.

Screen: You can control brightness and contrast for a built-in monitor. Works on all computers with built-in monitors.

Serial Switch: Provides compatibility for some applications that use the printer or modem port. You can set the serial port option to Faster or More Compatible. Works on Macintosh IIfx and Macintosh Quadra 950 computers.

Sharing Setup: You can set file sharing options and specify a network name for your computer.

Sound: You can set the alert sound and volume and specify a sound input and sound output source for your computer. On PowerPC-based computers with PCI slots, this control panel is replaced by the Monitors & Sound control panel.

Speech: You can set options for hearing text read aloud by the computer. If you have Speakable Items software and a PlainTalk-compatible microphone, you can set options for giving spoken commands to the computer. Works on all Macintosh 660AV and 840AV computers. Also works on all computers with PowerPC microprocessors.

Startup Disk: You can select the disk used to start up your computer.

TCP/IP: You can specify TCP/IP settings for use with Apple's Open Transport networking.

Text: You can select from the text features for the script systems installed on your computer.

Trackpad: You can set how far the pointer moves when you move your finger on the trackpad, and how fast you double-click. Works on all Macintosh PowerBook 500/5000 models.

Users & Groups: You can specify who can access your computer's hard disk when file sharing is turned on.

Views: You can customize how information is displayed in Finder windows.

WindowShade: You can set whether to hide a window by clicking on its title bar.

Mac OS 7.6: About the Extensions Folder Read Me (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

This article is the About the Extensions Folder ReadMe file.

DISCUSSION -----

Mac OS 7.6
What's Inside the Extensions Folder?

About this document

If you're curious about the contents of the Extensions folder, this document provides a brief description of each extension. You can use these descriptions to help determine which extensions you may need and which ones you may not need.

What is an extension?

An extension is a small file that changes how your computer operates. Unlike a control panel, you typically do not have any direct interaction with an extension. An extension makes the appropriate changes when you start your computer and remains active until you shut down your computer.

Depending on the type of computer you have, the contents of your Extensions folder may vary. You might also have extensions that were added by third-party applications. You can use the Extensions Manager control panel to turn off any extension you don't need. Extensions with the letters "lib" in them are typically code libraries that may be used by multiple applications or system components. Turning off libraries may have unexpected effects. In general, you shouldn't turn off any extensions unless you know for certain what they're used for.

EM Extension: Used by the Extensions Manager control panel.

9500 Guide Additions: Adds step-by-step instructions for using features specific to the Power Macintosh 9500 to the on screen help provided in Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

A/ROSE: Allows communication between your computer's main logic board and NuBus cards that run the Apple Real-Time Operating System. Examples of such NuBus cards include the Apple Token Ring 4.16 NB card and the Apple Serial NB card.

About Apple Guide: Provides information about how to use Apple's on screen help system. You can access About Apple Guide from the Guide (question mark) menu when the Finder is active.

Apple Built-In Ethernet and Apple Ethernet NB: Used by Open Transport to allow access to the built-in Ethernet port on your computer.

AppleCD Audio Player Guide: Provides step-by-step instructions for using the AppleCD Audio Player. You can access the AppleCD Audio Player Guide from the Guide (question mark) menu, after you install and open AppleCD Audio Player.

Apple CD-ROM: Enables your computer to use an Apple CD-ROM drive.

Apple Color Printer: Enables your computer to print documents on an Apple Color Printer.

Apple Color SW Pro CMM: Contains color-matching information used by ColorSync 2.0 to maintain consistent color between documents.

Apple Guide: Enables your computer to use Apple's on screen help system.

Apple Photo Access: Part of the CD-ROM software for viewing Kodak PhotoCDs.

AppleScriptLib: Provides native support for AppleScript on PowerPC-based computers.

AppleScript: Enables automation of repetitive tasks in applications that support it. Some applications, such as Apple on screen help, require AppleScript to work.

AppleShare: Gives you access to shared disks on the network.

AppleTalk ImageWriter: Enables your computer to print documents on a networked ImageWriter II.

AppleVision Guide Additions: Adds step-by-step instructions to Mac OS Guide about how to use AppleVision displays with your computer. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

Assistant Toolbox: This is the base extension for AutoRemounter. AutoRemounter works on portable computers and allows file synchronization, battery management, and easy mobile computing. It also provides support for a persistent RAM disk and deferred printing. This extension may conflict with the LaserWriter Select 310 printer software to block printing. A solution is to turn off background

printing in the Chooser.

Audio CD Access: Lets you play audio CDs on your internal or external CD-ROM drive. Requires the AppleCD Audio Player or equivalent application to control the audio CD.

AV Guide Additions: Adds step-by-step instructions to Mac OS Guide about how to use AV monitors with your computer. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

AV Setup: Used to control AppleVision displays.

Caps Lock: Provides a visual indication of the state of the Caps Lock key on a portable computer. When Caps Lock is turned on, an "up" arrow appears in the menu bar next to the Guide (question mark) menu. (Not needed on Macintosh PowerBook 500 series computers.)

Clipping Extension: Lets you use the drag-and-drop feature to create clipping files on your desktop.

Color Picker: Presents a standard interface for color selection. Applications can use this tool to let you choose colors.

Color SW 2000 Series CMM: Color-matching information used by ColorSync to maintain consistent color between documents printed on a Color StyleWriter 2000 series printer and other color devices.

Color SW 2400: Enables your computer to print documents on a Color StyleWriter 2200 or Color StyleWriter 2400.

Color SW Pro: Enables your computer to print documents on a Color StyleWriter Pro.

ColorSync: Matches colors on your display with the closest matching colors on your printers, scanners, and other devices.

Desktop Printer Extension, Desktop Printer Spooler, Desktop PrintMonitor: All three of these files are necessary for the desktop printing feature to work. (With desktop printing, you can print documents by dragging their icons to printer icons.)

Energy Saver Guide Additions: Adds step-by-step instructions for using Energy Saver to the on screen help provided in Mac OS Guide. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

EtherTalk Phase 2: Lets you connect your computer to an Ethernet network.

File Sharing Extension: Enables your computer to share files and folders with other computers on your network.

Find File Extension: Lets you search for files and view the results in a single window. If you turn off this extension and choose Find from the File menu, you'll get the System 7.1 Find dialog box instead of the Find File window.

Finder Help: Provides Balloon Help support for the Finder.

Finder Scripting Extension: Allows you to use AppleScript to automate tasks in the Finder.

Foreign File Access: Enables your computer to work with CD-ROM discs whose contents don't use the standard Mac OS file system (for example, ISO 9660 or High Sierra formats).

Global Guide Files folder: Contains files used by the on screen help system. Some of these files may be used to provide help more than one application.

Graphics Accelerator: Provides video acceleration for the PCI video card.

High Sierra File Access: Part of the CD-ROM software that lets you view CDs with High Sierra file systems.

IIci/IIsi Monitors: Describes the capabilities of the built-in video card for the Macintosh IIci and IIsi. If you remove this file, your computer can still use the video card and you can still select the number of colors displayed on your monitor, but monitor options (such as gamma settings) may not be available.

ImageWriter: Enables your computer to print documents on an ImageWriter or ImageWriter II connected to a serial port.

ImageWriter LQ: Enables your computer to print documents on an ImageWriter LQ connected to a serial port.

ISO 9660 File Access: Part of the CD-ROM software that lets you view CDs with ISO 9660 file systems.

LaserWriter 300: Enables your computer to print documents on a Personal LaserWriter 300, LaserWriter Select 300, or a Personal LaserWriter LS.

LaserWriter 8: (version 8.x) A PostScript level II print driver that enables your computer to print documents on a PostScript printer connected to an AppleTalk network.

LaserWriter IISC: Enables your computer to print documents on a LaserWriter IISC connected to a SCSI port. Replaced by Personal LaserWriter SC.

LW Select 310: Enables your computer to print documents on a LaserWriter Select 310.

MacinTalk 3: Lets your computer read text documents in human-like voices.

Mac OS Guide: Contains step-by-step instructions for working in the Finder. You access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

Monitors & Sound Guide Additions: Adds step-by-step instructions for using the

Monitors & Sound control panel to Mac OS Guide. You access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

My Speech Macros: Supports the Speech Macro Editor.

Network Extension: Lets you set Personal File Sharing from the Finder.

OpenDoc Libraries folder: Contains code libraries and other files that enable OpenDoc technology.

ObjectSupportLib: A library developers use to support AppleScript on computers with PowerPC microprocessors.

Open Transport Guide Additions: Adds step-by-step instructions for using Open Transport networking software to Mac OS Guide. You access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

Open Tpt AppleTalk Library: Used by Open Transport for the AppleTalk communication protocol.

Open Tpt Internet Library: Used by Open Transport for the TCP/IP communication protocol.

Open Transport Library: Used by Open Transport.

OpenTptAppleTalkLib: Used by Open Transport for AppleTalk communication protocol.

OpenTptInternetLib: Used by Open Transport for the TCP/IP communication protocol.

OpenTransportLib: Used by Open Transport.

PB 500 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 500 to Mac OS Guide. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

PB 190 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 190 to Mac OS Guide. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

PB 2300 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 2300 to Mac OS Guide. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

PB 5300 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 5300 to Mac OS Guide. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

Personal LaserWriter SC: Enables your computer to print documents on a Personal LaserWriter SC or a LaserWriter IISC.

Portable StyleWriter: Enables your computer to print documents on a Portable

StyleWriter.

PowerBook Guide Additions: Adds PowerBook-specific topics to Mac OS Guide. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

PowerBook Monitors Extension: Describes the PowerBook built-in display. If you remove this file, your computer can still use the PowerBook video card and you can still select the number of colors your screen can display, but certain options (such as gamma settings) may not be available.

PowerPC Monitors Extension: Supports the AudioVision 14 monitor.

Printer Descriptions: Contains descriptions for all printers that use the LaserWriter 8 printer software.

Printer Share: Provides the ability to share non-network printers (for example, the StyleWriter II) across a network.

PrintingLib: Used by the desktop printing software.

PrintMonitor: Controls the printing process when background printing is activated.

Quadra AV Monitors Extension: Describes the capabilities of the built-in video card for the Macintosh Quadra and Centris AV computers. If you remove this file, your computer can still use the video card and you can still select the number of colors displayed on your monitor, but monitor options (such as gamma settings) may not be available.

Quadra Monitors Extension: Describes the capabilities of the built-in video card for the Macintosh Quadra and Macintosh Centris computers. If you remove this file, your computer can still use the video card and you can still select the number of colors displayed on your monitor, but monitor options (such as gamma settings) may not be available.

QuickTime: Provides built-in multimedia support for applications.

QuickTime PowerPlug: Provides native support of QuickTime for PowerPC-based computers when used in combination with QuickTime 2.0. This extension must be used in addition to QuickTime 2.0.

QuickTime Musical Instruments: Supports 30 Roland Standard MIDI sound samples that can be accessed by QuickTime applications with no additional MIDI equipment.

Scripting Additions: Extends the AppleScript language with special features, such as finding the date or time of day. With scripting additions installed, AppleScript acts as if these features are part of the language. Scripting additions are required only when a script uses them.

Serial (Built-In): Used by Open Transport to allow access to the built-in serial port on your computer.

Shared Library Manager: Provides native support for Open Transport.

Shortcuts: Explains common keyboard equivalents and other shortcuts to use in the Finder. You can access Shortcuts in the Guide (question mark) menu when the Finder is active.

SimpleText Guide: Provides step-by-step instructions for using SimpleText. You can access the SimpleText Guide from the Guide (question mark) menu, after you open SimpleText.

Speech Guide Additions: Adds step-by-step instructions for using speech recognition to the on screen help provided in Mac OS Guide. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

SOMobjects for Mac OS: Used by OpenDoc.

Speech Manager: Provides text-to-speech capabilities.

SR Monitor: Used to monitor and interpret speech.

Startup Tuner: Ensures correctly starting up from the disk selected in the Startup Disk control panel.

StyleWriter II: Enables your computer to print documents on a StyleWriter II. Replaced by StyleWriter 1200.

StyleWriter 1200: Enables your computer to print documents on a StyleWriter, StyleWriter II, or StyleWriter 1200.

SystemAV: Used for audio-video input.

System Speech Rules: Supports voices and speech dialects.

TokenTalk Phase 2: Used by the Apple Token Ring card.

TokenTalk Prep: Supports TokenTalk Phase II.

Tutorial Items: Provides instructions for learning basic skills on your computer. You can access the tutorial from the Guide (question mark) menu when the Finder is active.

Video Startup: Used by the Apple Video Player.

Voices folder: Includes voices your computer can use when reading text or speaking alert messages.

WorldScript Power Adapter: Supports language kit software on PowerPC-based computers. However, computers that use the Roman alphabet (English and French, for example), can still take advantage of performance and stability enhancements provided by the WorldScript Power Adapter.

Mac OS 7.6: About the Extensions Folder Read Me (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

This article is the About the Extensions Folder ReadMe file.

DISCUSSION -----

Mac OS 7.6
What's Inside the Extensions Folder?

About this document

If you're curious about the contents of the Extensions folder, this document provides a brief description of each extension. You can use these descriptions to help determine which extensions you may need and which ones you may not need.

What is an extension?

An extension is a small file that changes how your computer operates. Unlike a control panel, you typically do not have any direct interaction with an extension. An extension makes the appropriate changes when you start your computer and remains active until you shut down your computer.

Depending on the type of computer you have, the contents of your Extensions folder may vary. You might also have extensions that were added by third-party applications. You can use the Extensions Manager control panel to turn off any extension you don't need. Extensions with the letters "lib" in them are typically code libraries that may be used by multiple applications or system components. Turning off libraries may have unexpected effects. In general, you shouldn't turn off any extensions unless you know for certain what they're used for.

EM Extension: Used by the Extensions Manager control panel.

9500 Guide Additions: Adds step-by-step instructions for using features specific to the Power Macintosh 9500 to the on screen help provided in Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

A/ROSE: Allows communication between your computer's main logic board and NuBus cards that run the Apple Real-Time Operating System. Examples of such NuBus cards include the Apple Token Ring 4.16 NB card and the Apple Serial NB card.

About Apple Guide: Provides information about how to use Apple's on screen help system. You can access About Apple Guide from the Guide (question mark) menu when the Finder is active.

Apple Built-In Ethernet and Apple Ethernet NB: Used by Open Transport to allow access to the built-in Ethernet port on your computer.

AppleCD Audio Player Guide: Provides step-by-step instructions for using the AppleCD Audio Player. You can access the AppleCD Audio Player Guide from the Guide (question mark) menu, after you install and open AppleCD Audio Player.

Apple CD-ROM: Enables your computer to use an Apple CD-ROM drive.

Apple Color Printer: Enables your computer to print documents on an Apple Color Printer.

Apple Color SW Pro CMM: Contains color-matching information used by ColorSync 2.0 to maintain consistent color between documents.

Apple Guide: Enables your computer to use Apple's on screen help system.

Apple Photo Access: Part of the CD-ROM software for viewing Kodak PhotoCDs.

AppleScriptLib: Provides native support for AppleScript on PowerPC-based computers.

AppleScript: Enables automation of repetitive tasks in applications that support it. Some applications, such as Apple on screen help, require AppleScript to work.

AppleShare: Gives you access to shared disks on the network.

AppleTalk ImageWriter: Enables your computer to print documents on a networked ImageWriter II.

AppleVision Guide Additions: Adds step-by-step instructions to Mac OS Guide about how to use AppleVision displays with your computer. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

Assistant Toolbox: This is the base extension for AutoRemounter. AutoRemounter works on portable computers and allows file synchronization, battery management, and easy mobile computing. It also provides support for a persistent RAM disk and deferred printing. This extension may conflict with the LaserWriter Select 310 printer software to block printing. A solution is to turn off background

printing in the Chooser.

Audio CD Access: Lets you play audio CDs on your internal or external CD-ROM drive. Requires the AppleCD Audio Player or equivalent application to control the audio CD.

AV Guide Additions: Adds step-by-step instructions to Mac OS Guide about how to use AV monitors with your computer. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

AV Setup: Used to control AppleVision displays.

Caps Lock: Provides a visual indication of the state of the Caps Lock key on a portable computer. When Caps Lock is turned on, an "up" arrow appears in the menu bar next to the Guide (question mark) menu. (Not needed on Macintosh PowerBook 500 series computers.)

Clipping Extension: Lets you use the drag-and-drop feature to create clipping files on your desktop.

Color Picker: Presents a standard interface for color selection. Applications can use this tool to let you choose colors.

Color SW 2000 Series CMM: Color-matching information used by ColorSync to maintain consistent color between documents printed on a Color StyleWriter 2000 series printer and other color devices.

Color SW 2400: Enables your computer to print documents on a Color StyleWriter 2200 or Color StyleWriter 2400.

Color SW Pro: Enables your computer to print documents on a Color StyleWriter Pro.

ColorSync: Matches colors on your display with the closest matching colors on your printers, scanners, and other devices.

Desktop Printer Extension, Desktop Printer Spooler, Desktop PrintMonitor: All three of these files are necessary for the desktop printing feature to work. (With desktop printing, you can print documents by dragging their icons to printer icons.)

Energy Saver Guide Additions: Adds step-by-step instructions for using Energy Saver to the on screen help provided in Mac OS Guide. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

EtherTalk Phase 2: Lets you connect your computer to an Ethernet network.

File Sharing Extension: Enables your computer to share files and folders with other computers on your network.

Find File Extension: Lets you search for files and view the results in a single window. If you turn off this extension and choose Find from the File menu, you'll get the System 7.1 Find dialog box instead of the Find File window.

Finder Help: Provides Balloon Help support for the Finder.

Finder Scripting Extension: Allows you to use AppleScript to automate tasks in the Finder.

Foreign File Access: Enables your computer to work with CD-ROM discs whose contents don't use the standard Mac OS file system (for example, ISO 9660 or High Sierra formats).

Global Guide Files folder: Contains files used by the on screen help system. Some of these files may be used to provide help more than one application.

Graphics Accelerator: Provides video acceleration for the PCI video card.

High Sierra File Access: Part of the CD-ROM software that lets you view CDs with High Sierra file systems.

IIci/IIsi Monitors: Describes the capabilities of the built-in video card for the Macintosh IIci and IIsi. If you remove this file, your computer can still use the video card and you can still select the number of colors displayed on your monitor, but monitor options (such as gamma settings) may not be available.

ImageWriter: Enables your computer to print documents on an ImageWriter or ImageWriter II connected to a serial port.

ImageWriter LQ: Enables your computer to print documents on an ImageWriter LQ connected to a serial port.

ISO 9660 File Access: Part of the CD-ROM software that lets you view CDs with ISO 9660 file systems.

LaserWriter 300: Enables your computer to print documents on a Personal LaserWriter 300, LaserWriter Select 300, or a Personal LaserWriter LS.

LaserWriter 8: (version 8.x) A PostScript level II print driver that enables your computer to print documents on a PostScript printer connected to an AppleTalk network.

LaserWriter IISC: Enables your computer to print documents on a LaserWriter IISC connected to a SCSI port. Replaced by Personal LaserWriter SC.

LW Select 310: Enables your computer to print documents on a LaserWriter Select 310.

MacinTalk 3: Lets your computer read text documents in human-like voices.

Mac OS Guide: Contains step-by-step instructions for working in the Finder. You access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

Monitors & Sound Guide Additions: Adds step-by-step instructions for using the

Monitors & Sound control panel to Mac OS Guide. You access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

My Speech Macros: Supports the Speech Macro Editor.

Network Extension: Lets you set Personal File Sharing from the Finder.

OpenDoc Libraries folder: Contains code libraries and other files that enable OpenDoc technology.

ObjectSupportLib: A library developers use to support AppleScript on computers with PowerPC microprocessors.

Open Transport Guide Additions: Adds step-by-step instructions for using Open Transport networking software to Mac OS Guide. You access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

Open Tpt AppleTalk Library: Used by Open Transport for the AppleTalk communication protocol.

Open Tpt Internet Library: Used by Open Transport for the TCP/IP communication protocol.

Open Transport Library: Used by Open Transport.

OpenTptAppleTalkLib: Used by Open Transport for AppleTalk communication protocol.

OpenTptInternetLib: Used by Open Transport for the TCP/IP communication protocol.

OpenTransportLib: Used by Open Transport.

PB 500 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 500 to Mac OS Guide. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

PB 190 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 190 to Mac OS Guide. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

PB 2300 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 2300 to Mac OS Guide. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

PB 5300 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 5300 to Mac OS Guide. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

Personal LaserWriter SC: Enables your computer to print documents on a Personal LaserWriter SC or a LaserWriter IISC.

Portable StyleWriter: Enables your computer to print documents on a Portable

StyleWriter.

PowerBook Guide Additions: Adds PowerBook-specific topics to Mac OS Guide. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

PowerBook Monitors Extension: Describes the PowerBook built-in display. If you remove this file, your computer can still use the PowerBook video card and you can still select the number of colors your screen can display, but certain options (such as gamma settings) may not be available.

PowerPC Monitors Extension: Supports the AudioVision 14 monitor.

Printer Descriptions: Contains descriptions for all printers that use the LaserWriter 8 printer software.

Printer Share: Provides the ability to share non-network printers (for example, the StyleWriter II) across a network.

PrintingLib: Used by the desktop printing software.

PrintMonitor: Controls the printing process when background printing is activated.

Quadra AV Monitors Extension: Describes the capabilities of the built-in video card for the Macintosh Quadra and Centris AV computers. If you remove this file, your computer can still use the video card and you can still select the number of colors displayed on your monitor, but monitor options (such as gamma settings) may not be available.

Quadra Monitors Extension: Describes the capabilities of the built-in video card for the Macintosh Quadra and Macintosh Centris computers. If you remove this file, your computer can still use the video card and you can still select the number of colors displayed on your monitor, but monitor options (such as gamma settings) may not be available.

QuickTime: Provides built-in multimedia support for applications.

QuickTime PowerPlug: Provides native support of QuickTime for PowerPC-based computers when used in combination with QuickTime 2.0. This extension must be used in addition to QuickTime 2.0.

QuickTime Musical Instruments: Supports 30 Roland Standard MIDI sound samples that can be accessed by QuickTime applications with no additional MIDI equipment.

Scripting Additions: Extends the AppleScript language with special features, such as finding the date or time of day. With scripting additions installed, AppleScript acts as if these features are part of the language. Scripting additions are required only when a script uses them.

Serial (Built-In): Used by Open Transport to allow access to the built-in serial port on your computer.

Shared Library Manager: Provides native support for Open Transport.

Shortcuts: Explains common keyboard equivalents and other shortcuts to use in the Finder. You can access Shortcuts in the Guide (question mark) menu when the Finder is active.

SimpleText Guide: Provides step-by-step instructions for using SimpleText. You can access the SimpleText Guide from the Guide (question mark) menu, after you open SimpleText.

Speech Guide Additions: Adds step-by-step instructions for using speech recognition to the on screen help provided in Mac OS Guide. You can access Mac OS Guide from the Guide (question mark) menu when the Finder is active.

SOMobjects for Mac OS: Used by OpenDoc.

Speech Manager: Provides text-to-speech capabilities.

SR Monitor: Used to monitor and interpret speech.

Startup Tuner: Ensures correctly starting up from the disk selected in the Startup Disk control panel.

StyleWriter II: Enables your computer to print documents on a StyleWriter II. Replaced by StyleWriter 1200.

StyleWriter 1200: Enables your computer to print documents on a StyleWriter, StyleWriter II, or StyleWriter 1200.

SystemAV: Used for audio-video input.

System Speech Rules: Supports voices and speech dialects.

TokenTalk Phase 2: Used by the Apple Token Ring card.

TokenTalk Prep: Supports TokenTalk Phase II.

Tutorial Items: Provides instructions for learning basic skills on your computer. You can access the tutorial from the Guide (question mark) menu when the Finder is active.

Video Startup: Used by the Apple Video Player.

Voices folder: Includes voices your computer can use when reading text or speaking alert messages.

WorldScript Power Adapter: Supports language kit software on PowerPC-based computers. However, computers that use the Roman alphabet (English and French, for example), can still take advantage of performance and stability enhancements provided by the WorldScript Power Adapter.

About the Mac OS 7.6 Utilities Read Me (1/97)

Article Created: 24 January 1997

TOPIC -----

This article is the About the Mac OS 7.6 Utilities ReadMe file.

DISCUSSION -----

About the Mac OS 7.6 Utilities

This document contains information about the utilities provided with Mac OS 7.6.

5xxx/6xxx Tester

This program tests Performa and Power Macintosh 5200, 5300, 6200, and 6300 computers for a possible hardware problem. If you have a Performa or Power Macintosh 5200, 5300, 6200, or 6300 series computer, you should use the tester before installing Mac OS 7.6. See the document inside the Tester folder for instructions on using the tester.

IMPORTANT: The Power Macintosh or Performa 6360 does not have this hardware problem. If you have a Power Macintosh or Performa 6360, you do not need to use the tester program.

AppleShare software

If you have AppleShare software version 3.6, 3.6.1, or 3.6.2, you should upgrade to version 3.6.3 before installing Mac OS 7.6 over a network. See the document inside the AppleShare folder for instructions.

Disk First Aid

You use the Disk First Aid program to test and repair your hard disk.

To test a disk, follow these steps:

- 1) Open the Disk First Aid program.
- 2) In the screen that appears, click the icon of the disk you want to check.
- 3) Click Verify to test the disk for problems.

Drive Setup and HD SC Setup

You use the Drive Setup or HD SC Setup programs to update your disk driver or to reinitialize a disk. You should update the drivers on your hard disks before installing system software.

The following computers should use the Drive Setup program:

all computers with PowerPC microprocessors
Macintosh LC 580
Macintosh LC 630
Macintosh LC 630 DOS Compatible
Macintosh Quadra 630 series computers
Macintosh Performa 580 series computers
Macintosh Performa 630 and 640 series computers
PowerBook 150 series computers
PowerBook 190 series computers

All other computers should use HD SC Setup.

Note for PowerBook 150 owners: You do not need to update the driver for your internal hard disk. That driver is contained in your computer's ROM. If you try using either utility program to update the driver, nothing will happen.

Note for Quadra owners with a PowerPC Upgrade Card: Drive Setup does not work with your upgrade card. You can use HD SC Setup to update your driver or initialize a disk, but you need to turn off the PowerPC upgrade card before using HD SC Setup.

To update the disk driver with Drive Setup, follow these steps:

- 1) Open the Drive Setup program.
- 2) Click the disk whose driver you want to update.
- 3) Choose Update Driver from the Functions menu.

To update the disk driver with HD SC Setup, follow these steps:

- 1) Open the HD SC Setup program.
- 2) Click Drive until the "volume name" is the name of the disk whose driver you want to update.
- 3) Click Update.

WARNING: Before using Drive Setup or HD SC Setup to update your disk driver, make sure you turn off any disk protection software you may be using.

IMPORTANT: If the Update Driver command is dimmed, or if the disk name never appears when you click Drive, the problem disk is either not supported, or it's previously been updated with a non-Apple utility.

- If the disk isn't supported, check the instructions that came with your computer or disk to see if the manufacturer includes or recommends a disk utility, and use that utility to update the driver. To ensure a successful update, obtain the latest version of the utility.
- If you've updated or formatted the disk with a non-Apple utility, you'll need to use that utility again to perform the update. To ensure a successful update, obtain the latest version of the utility.

Adobe Acrobat Reader

With the Acrobat Reader, you can read and print documents saved in the Acrobat .pdf format. You don't need the the fonts or applications used to create these files; you only need the Acrobat Reader software.

To install the Acrobat Reader, double-click the Installer icon in the Acrobat folder.

Mac OS 7.6: About the System Folder Read Me (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

This article is the About the System Folder ReadMe folder.

DISCUSSION -----

Mac OS 7.6
What's Inside the System Folder?

About this document

If you're curious about the contents of the System Folder, this document provides a brief description of what's inside.

Depending on the type of computer you have, the contents of the System Folder may vary. You might also have items that were added by third-party applications.

Finder: Displays the desktop area, where you work with files and disks, and keeps track of your files.

Apple Menu Items folder: When you place an item (folder, application, or document) in this folder, it appears in the Apple () menu. To create submenus, you can place folders inside of folders.

Clipboard: Temporarily stores the last item you cut or copied from a document.

Control Panels folder: Contains individual control panels. You use control panels to adjust your computer's settings. See the "About the Control Panels" document in the Apple Extras folder for more information.

Control Strip Modules folder: Contains modules used by the Control Strip.

Editors: Contains OpenDoc part editors. Editors provide functionality to OpenDoc

parts, but you don't work with editors directly. To use an editor to create a document, double-click the editor's stationery icon. Your stationery icons are probably located in the Stationery folder on your hard disk.

Extensions folder: Contains individual extensions that modify the operation of your computer. Unlike a control panel, an extension works automatically, without your intervention. See the "About the Extensions Folder" document in the Apple Extras folder for more information.

Fonts folder: Contains font suitcases or individual font files. You can place up to 128 suitcase or font files in this folder. PostScript fonts are not included in the 128 file limit. Font suitcases can hold any number of font files, up to a limit of 16 MB.

Launcher Items folder: Contains files, folders, and applications that appear in the Launcher window.

Macsbug: A debugger used by programmers to help diagnose problems with programs, extensions, and so on. Unless you're programming, you don't need Macsbug.

Preferences folder: Contains preferences files created by individual applications. A preference file determines application settings.

PrintMonitor Documents folder: Stores information waiting to be printed.

Scrapbook: Stores items placed in the Scrapbook. (The Scrapbook is available in the Apple menu.)

Shutdown Items folder: Contains applications or scripts that run automatically when you shut down your computer. You can add or remove items from this folder.

Startup Items folder: Contains applications or scripts that run automatically when you start your computer. You can add or remove items from this folder.

System file: Contains some system-wide resources, such as sounds and keyboard layouts.

Mac OS 7.6: Desktop Patterns Information Read Me (1/97)

Revised: 1/24/97
Security: Everyone

Mac OS 7.6: Desktop Patterns Information Read Me (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

This article is the Desktop Patterns Information ReadMe file which comes with Mac OS 7.6.

DISCUSSION -----

About the Desktop Patterns Clipping Folder

What are Desktop Patterns?

Desktop Patterns allow you to change the pattern or color of your computer's desktop. Since you are using System 7.5, you already have Desktop Patterns installed in your Control Panels folder. The files in the Desktop Pattern Clippings folder provide additional patterns. To view any of these patterns, simply double-click its icon.

How can I install these Desktop Pattern clippings into my system?

To install any of the Desktop Pattern clippings, follow these steps:

- 1) Open the Desktop Pattern Clippings folder.
- 2) Open the Desktop Patterns control panel (in the Control Panels folder inside the System Folder).
- 3) Drag the desired Desktop Pattern clipping from the Desktop Pattern Clippings folder onto the pattern currently displayed in the Desktop Patterns control panel, and release the mouse button.

The Desktop Pattern clipping that you dragged now appears in the window of the Desktop Patterns control panel. You can choose it as your desktop pattern by clicking Set Desktop Pattern.

Installing Mac OS 7.6 Read Me (1/97)

Revised: 3/19/97
Security: Everyone

Installing Mac OS 7.6 Read Me (1/97)

Article Created: 24 January 1997

TOPIC -----

This article is the Installing Mac OS 7.6 ReadMe file.

DISCUSSION -----

Installing Mac OS 7.6

This document describes how to install Mac OS 7.6. It includes compatibility information, instructions for the Install Mac OS application program, and basic installation troubleshooting.

For more detailed information, see the Mac OS 7.6 installation manual.

WARNING: PowerTalk is not compatible with Mac OS 7.6. After you install Mac OS 7.6, you won't be able to access your PowerTalk mail or catalogs, nor will you be able to use your keychain or other PowerTalk services. See the Mac OS 7.6 installation manual for more information.

IMPORTANT: OpenDoc, Cyberdog, and the LaserWriter 8.4 driver use a common piece of software called the CFM 68K Runtime Enabler. Apple has discovered a problem with the CFM 68K Runtime Enabler and is not including it with Mac OS 7.6. You cannot install OpenDoc, Cyberdog, and the LaserWriter 8.4 driver on computers with 68030 and 68040 microprocessors. (These items are included with Mac OS 7.6 for computers with PowerPC microprocessors.)

You may have applications that use the CFM 68K Runtime Enabler. Additional Apple products that use this software include Apple Telecom software, version 3.0 or later, and the Apple Media Tool. These applications will not work on computers with 68030 and 68040 microprocessors and Mac OS 7.6. However, since the problem exists independently of Mac OS 7.6, you should still install Mac OS 7.6 and not use applications or versions of applications that require the CFM 68K Runtime Enabler. Apple is working on a solution to this problem and will release a new version of the 68K Runtime Enabler as soon as possible.

Before you install
=====

- Start up your computer using the Mac OS 7.6 CD-ROM disc or the Mac OS 7.6 Install Me First floppy disk. See your installation manual for instructions.
- Although compatibility problems are not expected, you can ensure a smooth upgrade by checking with the manufacturers of any non-Apple software you use to make sure it is compatible with Mac OS 7.6. If you do experience a problem, see the troubleshooting chapter in your installation manual for more information on isolating compatibility problems.
- If you have a portable computer, make sure that the computer is plugged in.
- You cannot install this software onto a portable computer running in SCSI disk mode. (With SCSI disk mode, you connect your portable computer with a SCSI Disk Adapter cable to another computer and use the portable computer as an external hard disk.)

If you're installing over a network or can't start up with the Mac OS 7.6 disks, be sure to do the following:

- Turn off any installed disk security, virus protection, and screen saver programs before beginning. Also turn off At Ease software, if you have it installed.
- If you are installing on a portable computer, or a desktop computer with energy-saving software installed, set the computer so it will not go to sleep or shut down automatically. For instructions, see the documentation that came with your computer.
- If you have AppleShare Workstation software version 3.6, 3.6.1, or 3.6.2, you need to upgrade to version 3.6.4 before you can install Mac OS 7.6 over a network. This software is provided in the Utilities folder on the Mac OS 7.6 CD-ROM disc. Install this version of AppleShare before proceeding with the Mac OS 7.6 installation.

Compatibility information
=====

- MacTCP users should note network settings before installing Mac OS 7.6. MacTCP is removed when Mac OS 7.6 is installed. (Mac OS 7.6 includes the TCP/IP control panel instead.) If you are currently using MacTCP, you should note your current network settings (IP address, subnet mask, and so on) before installing Mac OS 7.6. After the installation, enter your network settings in the TCP/IP control panel.
- Computers with 68030 or 68040 processor upgrade cards. Computers upgraded to 68030 or 68040 with a processor upgrade card are not supported by Mac OS 7.6.

- Performa or Power Macintosh 5000 and 6000 series computers

Some Performa or Power Macintosh 5200 series, 5300 series, 6200 series and 6300 series models cannot use Mac OS 7.6 until a hardware problem is fixed. The repairs are covered under the Apple repair extension program. To see if your computer has this hardware problem, use the 5xxx/6xxx Tester utility in the Utilities folder on the CD before installing Mac OS 7.6.

IMPORTANT: The Power Macintosh or Performa 6360 does not have this hardware problem. If you have a Power Macintosh or Performa 6360, you do not need to use the tester program.

- Open Transport versions later than 1.1.1

Mac OS 7.6 installs Open Transport version 1.1.1. If you have a later version, you will need to reinstall it after installing Mac OS 7.6.

- Installing QuickDraw GX for use with a non-Apple printer

If you want to use QuickDraw GX with a non-Apple printer, you need to obtain a QuickDraw GX printer driver. You will not be able to use your non-Apple printer without a GX driver. Contact your printer vendor for details.

- Using the QuickDraw GX Installer when Adobe Acrobat is installed

If you use the QuickDraw GX Installer to either install or remove QuickDraw GX and your computer has Adobe Acrobat installed, Acrobat will display a message about missing fonts each time the computer is restarted. Reinstall Acrobat to stop the warning message.

- Installing Apple Remote Access client software when Open Transport PPP is already installed

Apple Remote Access installs older versions of modem scripts. If you install Apple Remote Access after Open Transport PPP, you'll see messages during the installation process. Respond that you want to use the newer versions of the modem scripts.

Using the Install Mac OS program

=====

To ensure a successful upgrade, you should use the Install Mac OS program to install the software. This program unifies the tasks recommended for a successful installation and simplifies the installation process. Be sure to follow all the steps on the Install Mac OS screen.

Update your hard disk drivers

Hard disks with drivers older than those included with System 7.5 might cause problems after installing Mac OS 7.6. Your computer might not start up, or you might not see the disk icons on the desktop. To avoid these and other potential problems, you should update your drivers.

To update your hard disk drivers, click the button for step 2 on the Install Mac OS screen. Read the dialog box that appears. You can't use the disk utilities provided by Apple if:

- You don't have an Apple computer, or you don't have an Apple hard disk. Check the instructions that came with your computer or hard disk to see if the manufacturer includes or recommends a disk utility, and use that utility to perform the update. Make sure to get the latest version of the disk utility (an old utility will install an old driver).
- You've previously used a non-Apple disk utility to format your disk or update the driver. You'll need to use that utility again to perform the update. Make sure to get the latest version of the disk utility (an old utility will install an old driver).
- You have a PowerBook 150 and no external drives attached to the computer. The driver for the PowerBook 150's internal hard disk is in the computer's ROM and doesn't need to be updated.

Otherwise, click Continue.

If you see an Update Driver button: Select a hard disk, then click Update Driver. Repeat this step for each hard disk attached to your computer.

If you don't see an Update Driver button: Click Drive until the "volume name" is a hard disk attached to your computer. Then click Update. Repeat this step for each hard disk attached to your computer.

Select a disk for installation

Click the button for step 3 on the Install Mac OS screen. Use the pop-up menu to choose the disk on which you want to install Mac OS 7.6.

For a typical installation, you need about 70 MB of disk space available on the disk you select. To install a minimal system, you need about 40 MB; to install all the optional software, you need about 120 MB.

Install the software

Click the button for step 4 on the main Install Mac OS screen. You'll see a list of software products.

Basic system software is automatically installed. On computers with PowerPC processors, OpenDoc and OpenDoc Essentials are also automatically installed. You can also choose to install the following software products. (Recommended choices are preselected.)

- QuickDraw 3D, to view and manipulate 3D images on your computer. Only computers with PowerPC microprocessors can use QuickDraw 3D.
- MacLinkPlus translators, to open documents created in applications you don't have with appropriate applications you do have, including DOS and Windows documents. (These translators work with the Mac OS Easy Open control panel.)
- Apple Remote Access client software, to connect to a remote computer (such as your computer at work) using a modem. (The remote computer must have ARA server software installed.)
- Cyberdog, an application to access the Internet. Cyberdog requires the PowerPC microprocessor.
- Open Transport PPP software, to connect to the Internet using a modem.

- English text-to-speech software, to have your computer read text and alert messages.
- QuickDraw GX, for enhanced printing and typographical capabilities.

For more information about these components, see the What's New chapter of your installation manual.

Click Start to install the software you selected.

Note for expert users: To perform a custom installation, click the Customize button in the Software Installations window. For more information, see the chapter on installing in the Mac OS 7.6 manual.

Update to Mac OS 7.6 manual for Custom Installation: The Mac OS 7.6 Custom install has three options for the type of system software you can install:

- Universal system for any supported computer
- System for this computer
- Minimum system for any supported computer

Only one of these items should be selected at a time.

Troubleshooting suggestions

=====

Some Apple-branded disks manufactured by third parties, including the Apple 365 MB external hard disk, are not supported by the Apple disk utilities. If your disk cannot be updated with the Apple utilities, you'll need to use a third-party disk utility to update the driver.

If you see a message that your disk has problems and cannot be repaired, turn off file sharing if it is on, then try installing again. If that doesn't work, try using another disk-repair utility. If you don't have another utility, or if that utility also doesn't work, you may need to reinitialize the disk. Copy all your files to another disk first, as reinitializing erases the disk. For more information about reinitializing, see the manual that came with your computer.

If you experience problems during installation, be sure to start up with the Mac OS 7.6 CD-ROM disc or the Mac OS 7.6 Install Me First floppy disk. See your Mac OS 7.6 installation manual for instructions.

If you're installing over a network, or if you have a non-Apple CD-ROM drive and can't start up with the CD, turn off all extensions that weren't provided with your system software. Then restart the computer.

- With System 7.5 or later, you can open the Extensions Manager control panel and choose System 7.5.x in the Sets pop-up menu, then restart the computer.
- If you're using an earlier version of system software, drag any non-Apple extensions out of your Extensions folder in the System Folder, then restart the computer. If you need to use non-Apple devices during installation, retain only those extensions. (Examples include video drivers, alternative input devices, network card drivers, and removable media.) If you don't know where a particular extension came from, select its icon, then choose Get Info from the File menu.

..TIL20841-Installing_Mac_OS_7-6_Read_Me_1-97_(TA36397).pdf

Apple extensions all have "© Apple Computer, Inc" in the Version section of the Get Info box.

See the troubleshooting chapter in your installation manual for additional suggestions.

Introduction

Files added by the Open Transport installer

Open Transport AppleTalk features

- Static and dynamic AppleTalk address allocation
- Use of parameter RAM

Open Transport TCP/IP features

- DHCP server support
- DHCP address lease support
- Windows NT advanced server support
- BootP support
- Local Hosts file support
- MacTCP "server" addressing support
- MacTCP "dynamic" addressing support
- MacIP support
- PPP connectivity

Memory requirements

Application compatibility guidelines

Performance

Introduction

=====

Open Transport is modern networking and communications system software for the Mac OS. It is based on industry standards and brings a new level of networking connectivity, control, and compatibility to Mac OS computers, while preserving built-in support for easy-to-use networking. Open Transport 1.1.1 is compatible with system software version 7.5.3, 7.5.5 and later, as well as versions 7.1, 7.1.1, and 7.1.2.

For more important information about system requirements, compatibility, and known incompatibilities and limitations, read the About Open Transport 1.1.1 document.

Files Added by the Open Transport Installer

=====

Open Transport installs the AppleTalk and TCP/IP control panels into the Control Panels folder inside the System Folder of your startup disk. The Open Transport Installer also adds the following files to the Extensions folder inside the System Folder:

Shared Library Manager

Shared Library Manager PPC

These extensions implement a shared library mechanism on 68K and PowerPC Mac OS computers, respectively. Both extensions are required on PowerPC-based computers in order to support both emulated and native shared libraries.

OpenTransportLib

Open Transport Library

These shared libraries implement core Open Transport services on PowerPC-based computers. The first library contains the PowerPC implementation and an interface for native PPC applications. The second library contains the built-in Open Transport modules and an interface for emulated 68K applications.

OpenTptAppleTalkLib

Open Tpt AppleTalk Library

These shared libraries implement Open Transport AppleTalk services on PowerPC-based computers. The first library contains the PowerPC implementation and an interface for native PPC applications. The second library contains the built-in Open Transport modules and an interface for emulated 68K applications.

OpenTptInternetLib

Open Tpt Internet Library

These shared libraries implement Open Transport TCP/IP services on PowerPC-based computers. The first library contains the PowerPC implementation and an interface for native PPC applications. The second library contains the built-in Open Transport modules and an interface for emulated 68K applications.

Open Transport 68K Library

This shared library implements core Open Transport services on 68030- and 68040-based computers.

Open Tpt ATalk 68K Library

This shared library implements Open Transport AppleTalk services on 68030- and 68040-based computers.

Open Tpt Inet 68K Library

This shared library implements Open Transport TCP/IP services on 68030- and 68040-based computers.

Open Transport AppleTalk Features

=====

Static and dynamic AppleTalk address allocation

Open Transport AppleTalk supports static assigned (manually administered) protocol addresses as well as the dynamic addressing provided by AppleTalk Address Resolution Protocol (AARP). Static addressing allows AppleTalk nodes to be managed using the protocol address as a unique and stable identifier.

It is important that all nodes on each individual AppleTalk subnet (a given cable segment assigned a unique network number or network number range) be administered consistently—either all with dynamic addressing or all with pre-assigned static addresses. This avoids a potential conflict when a new dynamic node acquires an address assigned to manually-addressed node that is not connected or is off line. Administrators can enforce the addressing policy for a subnet by locking the addressing mode. As a precaution, Open Transport AppleTalk checks for duplicate protocol addresses on the LAN even when static addressing is configured.

Use of parameter RAM

Under classic AppleTalk, AppleTalk's on/off state, the selected network interface, the previous network (protocol) address, and the previous AppleTalk zone name are saved in persistent memory (parameter RAM) for reuse at startup. To ensure backward compatibility, this information is still stored and retrieved on systems using Open Transport AppleTalk. However, the following differences are found with Open Transport:

- At startup, Open Transport reads the current AppleTalk configuration file to determine if AppleTalk should be turned on or off. This value overrides the value saved in parameter RAM. The user is not explicitly notified when this occurs.
- If the network interface specified in the current AppleTalk configuration file is locked and the specified port is not available or cannot be initialized, Open Transport will not automatically switch the port back to LocalTalk. Instead, AppleTalk will remain off. The user sees a dialog box with this information.

Open Transport TCP/IP Features

=====

Open Transport brings a workstation-class implementation of TCP/IP protocols to Mac OS. As with MacTCP, Open Transport TCP/IP is a full 32-bit stack. Open Transport TCP/IP adds support for:

- dynamic path MTU discovery, for more efficient network use in heterogeneous network topologies
- Dynamic Host Configuration Protocol (DHCP), for centralized IP address configuration management. DHCP is an Internet Engineering Task Force (IETF) standards-track protocol.
- IP multicast, for participation as an MBone client for applications written to the native Open Transport API
- simultaneous TCP connections for applications written to the native Open Transport API are limited only by installed memory and processor power, for increased functionality as an Internet or other TCP/IP network server
- a new, more robust and standards-compliant domain name resolver (a caching stub DNR)
- support for developer access to raw IP services, as well as TCP and UDP
- Ethernet Version 2.0 and IEEE 802.3 framing, for better interoperability with a wider range of TCP/IP hosts
- implicit and explicit domain name search paths, for increased control of domain name resolution
- use of multiple IP routers with fail-over, for increased robustness in mission-critical applications
- TCP wildcard source port assignments start at 2048, increasing from that point.

DHCP server support

Apple's implementation conforms to the current versions of the applicable specification documents (RFCs). To date, Open Transport TCP/IP has been tested with the following DHCP server implementations:

- Competitive Automation (URL: <http://www.join.com>)
- FTP Software (URL: <http://www.ftp.com>)
- Hewlett Packard HP-UX (URL: <http://www.hp.com>)
- Microsoft Windows NT Advanced Server (URL: <http://www.microsoft.com>)
- Silicon Graphics (URL: <http://www.sgi.com>)
- Sun Solaris and SunOS (URL: <http://www.sun.com>)
- TGV (URL: <http://www.tgv.com>)

DHCP address lease support

Open Transport TCP/IP supports DHCP address leases. Open Transport TCP/IP automatically attempts to renew any address lease that reaches its renewal interval (by default, the renewal interval is reached when the lease is halfway completed). The renewal interval may be configured to a different value by making changes to the configuring DHCP server. Renewal is attempted regardless of how many times the lease has already been renewed. Lease rebinding is also supported. Should an interface's IP address lease expire, the interface is closed down. Open Transport TCP/IP does not currently support the DHCP Client ID option or the DHCPINFORM message, nor will it currently try to use the remainder of a previous but unexpired lease upon rebooting.

Windows NT advanced server support

With Open Transport 1.1 and later, Mac OS clients are interoperable with the Windows NTAS DHCP server on LAN links. However, Mac OS clients cannot acquire configuration information from an NT DHCP server across a dialup (PPP) link because there is not yet an accepted industry standard for DHCP over dialup. The NT implementation is based on proprietary Microsoft extensions. Mac OS clients cannot acquire configuration information nor register with a Microsoft WINS server. WINS is also dependent on Microsoft extensions to TCP/IP (requiring NetBIOS support).

The Internet Engineering Task Force (IETF) is developing a cross-platform industry standard technology for dynamic registration and look-up of IP names through the Dynamic Service Location working group. Apple has no current plans to implement the WINS extensions. Instead, we are fully committed to implementation of the applicable IETF standards as they emerge

Macintosh clients running versions of Open Transport prior to 1.1 could experience some interoperability problems due to other significant differences between the Microsoft implementation and that of a typical UNIX-based server.

BootP support

Open Transport 1.1 and later fully supports Bootstrap Protocol (BootP). Versions of Open Transport prior to 1.1 failed to accept a BootP Reply sent to the unicast (subnet broadcast) address, (for example, xxx.xxx.xxx.255. Replies sent to the all-nets broadcast address (for example, 255.255.255.255) were handled properly. Also, earlier versions of Open Transport required that the BootP gateway be zero hops away.

Local Hosts file support

Open Transport TCP/IP supports a Hosts file that may be used to supplement and/or customize the Domain Name Resolver's initial cache of information. The Hosts file is normally stored in the Preferences folder in the active System Folder. When Open Transport TCP/IP is initialized, it reads the Hosts file (if any). As in MacTCP, the supported Hosts file features follow a subset of the Domain Name System Master File Format (RFC 1035).

Open Transport TCP/IP is more stringent regarding the content and format of the Hosts file than was MacTCP, which permitted violation of the FQDN requirement

for <domain-name>. For instance, the format:

```
charlie          A          128.1.1.1
```

which was acceptable to the MacTCP DNR, is no longer permitted because of the use of domain search lists in Open Transport/TCP ("charlie" could potentially exist in any or all of the configured domains). To accomplish the same effect, use this format instead:

```
charlie          CNAME      myhost.mydomain.edu
myhost.mydomain.edu  A      128.1.1.1
```

This associates the local alias charlie with the fully qualified domain name myhost.mydomain.edu, and resolves it to the address 128.1.1.1. Use of local aliases is limited to CNAME entries; NS and A entries must use fully qualified domain names.

You can create a Hosts file with any text editor or word processor (the Hosts file must be stored in text format). If you use a Hosts file, keep it as short as possible, and include only entries that will be accessed frequently. This reduces the memory required to cache the DNS information and minimizes the need to maintain and update Hosts files as system information changes.

Open Transport TCP/IP automatically uses a Hosts file stored the Preferences folder of the active System Folder. If no Hosts file is found in the Preferences folder, Open Transport TCP/IP searches the active System Folder for a Hosts file. You can specify a particular Hosts file to use with a specific configuration. For example, one Hosts file might be set up for a user connecting via Ethernet, and another set up for when that user connects via modem.

For additional information about the Hosts file design of the Open Transport Domain Name Resolver, see the document "Apple Open Transport Reference Q&A." The latest version of the Q&A is available on the Internet at <ftp://seeding.apple.com/ess/public/opentransport/>.

MacTCP "server" addressing support

Open Transport TCP/IP supports both Bootstrap Protocol (BootP) and Reverse Address Resolution Protocol (RARP) configuration methods. MacTCP Server mode addressing was a combination of BootP and RARP. When Server mode was selected, MacTCP used BootP to attempt to acquire an IP address. If that failed, MacTCP tried RARP. Whichever protocol was successful was stored as a preference, and was used first the next time the computer started up. In Open Transport, you must choose BootP or RARP explicitly.

MacTCP "dynamic" addressing

Open Transport does not support MacTCP "dynamic" addressing. MacTCP dynamic mode addressing was based on an Apple-proprietary extension to TCP/IP protocols. It applied the address negotiation and assignment rules used by the AppleTalk protocols to TCP/IP networks, making it very easy to set up a Macintosh-only standalone TCP/IP network. Use of this dynamic addressing method in other scenarios, however, could create additional work for a network administrator.

The Internet community (IETF) has since developed a multivendor standard for the dynamic assignment of IP addresses, known as Dynamic Host Configuration Protocol (DHCP). Open Transport TCP/IP supports the industry standard DHCP.

MacIP support

MacIP is a protocol specification developed for carrying TCP/IP traffic on AppleTalk-only networks, originally LocalTalk networks. MacIP is today frequently used with AppleTalk Remote Access Protocol (ARAP) to provide mobile users access to TCP/IP network services.

Use of MacIP typically requires a gateway, which strips off the AppleTalk encapsulation and places the IP packet on the TCP/IP LAN. When packets are sent back to the MacIP end-node, the gateway replaces the AppleTalk encapsulation. MacIP gateway support is most frequently offered as an integrated service within a multiprotocol router. The gateway (router) attaches to both an AppleTalk and a TCP/IP network.

Open Transport supports MacIP in the TCP/IP control panel. Once selected, TCP/IP data is encapsulated in AppleTalk packets, and is sent through the selected network interface.

PPP connectivity

PPP (Point to Point Protocol) connectivity for Open Transport is currently based on the use of third-party software extensions known as "MDEVs." Early versions of these extensions may not be compatible with Open Transport. For information about MDEV compatibility, see the Open Transport 1.1 Read Me document.

Memory Requirements

Open Transport provides many new features and capabilities to Mac OS customers and, in general, will require more system memory (RAM) than does classic networking. However, the actual memory requirements of Open Transport vary depending upon the networking services in use at a given time. This is different from classic networking, which allocates memory to networking services and keeps it allocated even after networking services are no longer in use.

Factors contributing to differences in memory requirements include:

- Open Transport provides implementations of networking as both 680x0 and native PowerPC code. PowerPC code is typically larger (but also faster).
- Open Transport provides "mixed-mode" applications support, making it possible for both PowerPC native and 680x0 applications to use native networking on PowerPC-based computers.
- Open Transport includes both the new implementations of networking and the libraries required to provide backward compatibility support for the older AppleTalk and MacTCP programming interfaces.

- Open Transport requires less memory on systems with virtual memory enabled. Classic networking has about the same memory requirements regardless of the VM setting.
- Open Transport is based on the cross-platform standard STREAMs environment, which requires more memory than classic networking.

The difference in memory requirements depend upon the configuration of your computer. Some examples of base memory requirements include:

Begin_Table

Computer System	Virtual Memory	Classic AppleTalk & MacTCP	Open Transport
PowerPC-based	On	350K to 450K	200KB
PowerPC-based	Off	350K to 450K	up to 1.2MB
680x0-based	Off	350K to 450K	700KB to 800KB

End_Table

Application Compatibility Guidelines

=====

Apple has defined three levels of interoperability with Open Transport. The first, "Open Transport Compatible," is used to describe network applications originally developed for "classic" AppleTalk or MacTCP programming interfaces that now take advantage of Open Transport Compatibility Services. These applications automatically gain the benefits associated with the Open Transport control panels. However, they will not realize a significant performance increase on Power Macintosh systems, nor can they take advantage of Open Transport's transport-independence capabilities.

"Open Transport Ready" applications have adopted the new Open Transport APIs. They are PowerPC native, in addition to running on 680x0-based Macintosh systems. Open Transport-ready applications benefit from the new control panels and may also realize a significant performance boost when running on PowerPC-based computers.

The highest category of interoperability is "Open Transport Enhanced." In addition to adopting the new Open Transport APIs and being Power PC native, these applications can be dynamically configured to support AppleTalk, TCP/IP, or serial communication.

Applications that rely on undocumented APIs or examine private data structures in AppleTalk or MacTCP may not be fully compatible with Open Transport. Updated versions of these software products will be required for full compatibility.

Performance

=====

Open Transport is designed to take advantage of the PowerPC processor. For maximum performance, however, networking applications must also take advantage of the PowerPC processor, and should adopt the new Open Transport programming interfaces.

In general, current Mac OS networking applications are written for the 680x0 processor and use the "classic" (680x0-based) networking programming interfaces. These applications can still be used with Open Transport, and may perform somewhat better. Networking applications that are PowerPC-native but not Open Transport-ready may yield better performance, but still fall short of the maximum potential performance because they make use of Open Transport backward compatibility rather than its full capabilities.

Performance improvements will be greater with protocols that use larger datagram sizes. For example, TCP/IP users will see greater improvements than AppleTalk users, because AppleTalk has a fixed and limited datagram size. On high-speed datalinks such as fast Ethernet, FDDI, and ATM, the performance of the network interface card (NIC) driver code is also a significant factor.

Overall performance also depends on the amount of RAM available. Larger packet sizes and higher throughput place increased demand on the buffering system of Open Transport. If Open Transport becomes low on memory, throughput decreases to accommodate the limitation.

LaserWriter 16/600 PS: Stairstep Pattern w/ Solaris (1/97)

Revised: 1/24/97
Security: Everyone

LaserWriter 16/600 PS: Stairstep Pattern w/ Solaris (1/97)

=====

Article Created: 22 January 1997

TOPIC -----

I have setup the printer queue for my LaserWriter 16/600 PS on my workstation running Solaris 2.5.1. The output is staggered down the page, looking like a stairstep. How can I correct this?

DISCUSSION -----

You will need to make some modifications to the way the printer queue is setup on the LaserWriter 16/600 PS printer.

Step 1

Recreate the print queue, but use the print server as:
<hostname>!text

Example: printer name lw16, use lw16!text as the print queue

Step 2

Set the printer in the autoselect mode

Text is delivered to the remote queue "text" on remote server "lw16." The text's line feed problem solved because the remote queue "text" handles carriage returns properly. PostScript ignores white space, so any files sent to this queue will be functionally unaffected when PostScript RIPs.

Mac OS 7.6: Multiprocessing Software Q & A (1/97)

Revised: 4/21/97
Security: Everyone

Mac OS 7.6: Multiprocessing Software Q & A (1/97)

Article Created: 24 January 1997

TOPIC -----

This article provides answers to common questions about the multiprocessing software which comes with Mac OS 7.6.

DISCUSSION -----

Question: Is the MP Software needed on Mac OS computers with only one processor?

Answer: It is not required for the computer to function. However, applications which use some multi-processing API (application programming interface) calls may crash if the MP Software folder is removed, whether or not the computer has more than one processor. The MP kernel allocates tasks to available processors. So on single-processor systems all tasks go to the one and only processor. On multi-processor systems tasks can be sent to any slave processor.

Question: Why does the "About multiprocessing software" document say that the software is only installed on computers with more than one processor?

Answer: The document is in error. The software will install on all PowerPC-based Mac OS computers.

Question: What are the repercussions of removing the software on a single-processor machine?

Answer: In the future, more and more applications will become multi-processor aware and therefore will start to use Apple's MP API's. If the MP libraries are not present, a multi-processor aware application may crash or fail to launch.

Question: I get the message "The MP library could not be completely initialized

due to insufficient memory" when my computer is starting up with System 7.6.
Why?

Answer: You have the MetroNub debugger extension installed from Metroworks Code Warrior. The Code Warrior documentation advises - "The MetroNub debugger extension must have the size specified in its 'sysz' resource increased to 2,580,000 bytes. Use ResEdit or Resourcer to do this."

Mac OS 7.6: Processor Upgrade Card Compatibility (2/97)

Revised: 2/18/97
Security: Everyone

Mac OS 7.6: Processor Upgrade Card Compatibility (2/97)

Article Created: 24 January 1997
Article Reviewed/Updated: 18 February 1997

TOPIC -----

Which processor upgrade cards work with Mac OS 7.6?

DISCUSSION -----

Mac OS 7.6 is not recommended for a 68030-based computer with a 68040 upgrade card installed. If Mac OS 7.6 is installed on a computer with this configuration, it will exhibit problems starting up.

The performance improvements implemented in System 7.5 update 2.0 (7.5.3) specifically for 68030-based computers, can cause cache flushing problems on the 68040 upgrade card when Mac OS 7.6 is installed. There is no workaround to user Mac OS 7.6 with these upgrade cards installed. System 7.5.x users can startup in 24 bit mode with Virtual Memory turned off, turn off the cache of their 68040 cards, and still see benefit from their upgrade card.

Although Apple has not done extensive testing, cards which only increased the speed of an existing processor should work. For example, a 33 MHz 68040 upgrade card in a 25 MHz 68040 computer, or a 33 MHz or 40 MHz 68030 upgrade card in Macintosh IIci class computers. These cards should work correctly with Mac OS 7.6.

Mayo Clinic Family Health CD-ROM Disc Issue (1/97)

Revised: 1/24/97
Security: Everyone

Mayo Clinic Family Health CD-ROM Disc Issue (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

I have a Performa 6360/6400 computer and I received the Mayo Clinic Family Health CD-ROM disc with the computer. Here are two things I noticed when using this Compact Disc.

- After I install the Family Health application and launch it without the Compact Disc in the CD-ROM drive, I get the following message, "Please insert the Health Disk 2.0 CD in drive F: before running the program."
- When using the Family Health application, after doing the following steps, I get a Type 11 error or a system freeze:

- 1) Install Mayo Clinic Family Health Application from the CD.
- 2) Run the program
- 3) Click on the splash screen movie to continue and click OK on the disclaimer
- 4) Click General
- 5) Click Staying Well
- 6) Click Controlling Stress
- 7) Click Keeping your Stress Under Control
- 8) A type 11 error or system freeze occurs

Does Apple and IVI Publishing know about this, and are there any known fixes or workarounds for this?

DISCUSSION -----

Yes, this is a known issue. Apple has reported these Mayo Clinic Family Health CD v2.0 issues to IVI Publishing this titles developer. This title currently ships with the Macintosh Performa 6360 and 6400 computers.

To avoid the "Please insert the Health Disk 2.0 CD in drive F: before running the program." message, make sure you have the compact disc in the CD-ROM drive

before launching the Family Health application.

For the latest information regarding these issues, contact IVI Publishing at:

Modem Setup Packages for Newton 2.0: Read Me (1/97)

Revised: 1/24/97
Security: Everyone

Modem Setup Packages for Newton 2.0: Read Me (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

This article is the Modem Setup Packages for Newton 2.0 ReadMe file.

DISCUSSION -----

What are Modem Setup Packages?

Modem setup packages enable a MessagePad to configure and operate non-Apple modems. It contains definitions of modem capabilities and sets of command/initialization strings. Each modem or class of modems has its own modem setup package. Once installed on a MessagePad 120 or 130 with Newton 2.0 OS, the package appears in the modem portion of Prefs in Extras.

Installing Modem Setups

Install one or more modem setups using Newton Backup Utility, Newton Connection Kit, or Newton Package Installer.

Using Modem Setups

To select a modem setup, follow these steps:

- 1) Tap Extras to open the Extras Drawer, then tap Prefs (if you don't see Prefs, choose All Icons from the popup at the top of the Extras screen)
- 2) Tap Modem.
- 3) Tap Connect using
A list of modem setups installed on your MessagePad appears.
- 4) Tap your choice in the list.

To remove a modem setup, follow these steps:

- 1) Tap Extras to open the Extras Drawer, then tap Prefs (if you don't see Prefs, choose All Icons from the popup at the top of the Extras screen)
- 2) Tap Modem.
- 3) Tap Remove Setup.

A list of modem setups installed on your MessagePad appears.

4) Tap the modem setup you want to remove from the list.

A message appears telling you the selected modem setup was removed.

Modem Compatibility Disclaimer

While a sample of each modem was tested by Apple, modem manufacturer specifications are subject to change without notice, resulting in potential incompatibilities. Accordingly, Apple Computer, Inc. cannot guarantee the operability of any individual modem and will not be liable for damages resulting from the use of this information. Please contact the modem manufacturer for additional information.

Troubleshooting

If you receive error messages when using a modem for the first time, either the Newton cannot see the modem or the commands it is sending are not recognized. Open the modem portion of Prefs in Extras and verify that the appropriate port (Serial Port vs. PC Card) and modem setup is selected. If the problem persists, try using each of the other available modem setups (modems often have similar setup strings and capabilities). If none of the other modem setup work, contact the modem manufacturer or check www.newton.info.apple.com to see if other modem setups are available.

PowerBook 2300: Cannot Startup From Partitioned Drive (1/97)

Revised: 1/29/97
Security: Everyone

PowerBook 2300: Cannot Startup From Partitioned Drive (1/97)

Article Created: 21 January 1997
Article Reviewed/Updated: 29 January 1997

TOPIC -----

I have two PowerBook 2300c (Duo) series computers both of which have partitioned hard drives. Neither one of them starts up properly since I used Drive Setup 1.2.2 which came with System software 7.6 to update the driver on one hard drive and to partition the other.

- On one of these computers I had previously partitioned the hard drive into multiple volumes with a version of Drive Setup prior to version 1.2. It started up fine until I updated the hard disk driver using Drive Setup 1.2.2.
- On the other computer I did not partition or update the hard drive with an earlier version of Drive Setup before I partitioned the hard drive into multiple volumes using Drive Setup 1.2.2.

What is wrong with Drive Setup 1.2.2? How can I partition these hard drives into two or more startup volumes each?

DISCUSSION -----

Issue

When the ATA hard disk driver is installed by Drive Setup 1.2, 1.2.1, and 1.2.2 * you can no longer change from which partition you want your computer to start up. One of two things may happen:

- 1) The Startup Disk control panel beeps when a partition icon is clicked in the Startup Disk window. Startup Disk control panel does not accept any attempts to change the setting that determines which disk is to be the startup disk.
- 2) In other instances, you do not hear a beep when a partition icon is clicked in the Startup Disk window. The Startup Disk control panel does accept your attempts to change the startup disk setting, but the setting is not saved.

Because the startup disk/partition selection cannot be changed, even if there are usable System Folders on multiple partitions, there is no way for your computer to start up from the other partitions.

If you partition a PowerBook 2300c hard drive with Drive Setup 1.2.x, or you update a previously partitioned PowerBook 2300c hard drive with Drive Setup 1.2.x, you will have this problem.

Workaround

One workaround is to update the hard disk driver with Drive Setup 1.0.5. It is not necessary to reformat or reinitialize the hard drive. All you have to do is open Drive Setup 1.0.5, select the internal hard drive, and select Update Driver.

* Note: Drive Setup 1.2.2 allows you to update a volume even when Password Security installed and activated. It also fixes an issue which caused the drive to sometimes spin up and then down again before going to sleep or shutting down. If you use Drive Setup 1.0.5 instead of 1.2.2, you will lose these enhancements.

PowerBook 1400 HD Updater Read Me File

Revised: 1/24/97
Security: Everyone

PowerBook 1400 HD Updater Read Me File

Article Created: 17 January 1997

TOPIC -----

This article is the Readme file for the PowerBook 1400 HD Updater.

DISCUSSION -----

Important Information About the PowerBook 1400 HD Updater

This document describes the PowerBook 1400 HD Updater. You may want to print this document for reference.

What Is the PowerBook 1400 HD Updater?

The PowerBook 1400 HD Updater is designed to provide a reference file that may not have been copied on the hard disk of some Macintosh PowerBook 1400 series computers. The reference file is not needed for normal operation of the PowerBook.

However, a disk utility program, such as Disk First Aid, looks for the reference file. If the file is not on the hard disk and you use Disk First Aid or another disk utility, you will see a message reporting that the hard disk is not an HFS volume and can't be checked by the program. (The message may be somewhat different with a disk utility other than Disk First Aid.)

Who Needs to Use the Updater?

If the reference file is not on your computer's hard disk, you should use the PowerBook 1400 HD Updater to copy the file on the disk. To determine whether you need to use the Updater, follow these steps.

- Checking Your Hard Disk

1. Locate Disk First Aid (in the Utilities folder on your hard disk) and open it by double-clicking its icon.

2. Click the icon of the hard disk to select it.
3. If you see a message that you can't repair the startup disk, click OK. (You want to verify the disk, which can be done on the startup disk.)
4. Click Verify.
5. If you see a message "This drive is not an HFS disk," you need to use the PowerBook 1400 HD Updater. (If a status message appears reporting the progress of verification, you do not need to use the Updater. You can click Stop to end the verification process.)

- Using the PowerBook 1400 HD Updater

-
1. Copy the Updater to your computer's hard disk.
 2. Double-click the Updater's icon to open it. The Updater automatically copies the reference file on your hard disk.
 3. Click OK to quit the Updater.

It's a good idea to check your hard disk after using the Updater. To do this, run Disk First Aid and select the Verify option. If Disk First Aid reports a problem, follow the instructions on the screen. You can also use the Drive Setup program (in the Utilities folder) to check the hard disk. See "Testing Your Hard Disk" in Chapter 7 of the manual for your computer for more information about testing the drive.

Using the Updater will not cause any problem if the reference file is already on the hard disk.

PowerBook 1400: Mac OS 7.6 Why Separate Monitors & Sound? (1/97)

Revised: 2/10/97
Security: Everyone

PowerBook 1400: Mac OS 7.6 Why Separate Monitors & Sound? (1/97)

Article Created: 21 January 1997
Article Reviewed/Updated: 10 February 1997

TOPIC -----

Why do I have three control panels for controlling the display and sound on my PowerBook 1400 computer after installing Mac OS 7.6?

DISCUSSION -----

Issue

The Mac OS 7.6 installer incorrectly installs two additional control panels, 'Monitors' and 'Sound' on PowerBook 1400 series computers if you choose the Easy Install option, and are installing over an existing System Folder. You only need the one control panel, 'Monitors and Sound'. You can throw the other two away. All of these control panels work, but only the one which controls both the Monitors and Sound is needed.

If you are creating a new System folder (clean install) and you choose the Easy Install option, the Mac OS 7.6 installer incorrectly installs two separate control panels: 'Sound' and 'Monitors.', NOT the one 'Monitors and Sound'.

Resolution

To get the correct Monitors and Sound control panel, you must perform a Custom Installation in which you specifically select the desired control panel.

PowerBook 1400: Minimum & Full Set Same Number Of Disks? (2/97)

Revised: 2/14/97
Security: Everyone

PowerBook 1400: Minimum & Full Set Same Number Of Disks? (2/97)

=====

Article Created: 21 January 1997
Article Reviewed/Updated: 13 February 1997

TOPIC -----

I have a PowerBook 1400 series computer. I ran Floppy Disk Maker to create backup floppy disks of the System Software. Why do Minimum Set and the Full Set use the same number of disks? Shouldn't the Minimum Set have fewer disks?

DISCUSSION -----

Apple's Floppy Disk Maker utility was designed for all Macintosh computers, not just the Powerbook 1400 series computers.

* Floppy Disk Maker's Minimum Set only makes images of the contents of the System Software Images folder in the Disk Images folder.

* Floppy Disk Maker's Full Set makes disks for every folder in the Disk Images folder. On other Macintosh computers this may include additional support files in other folders.

Since the only disk images in the PowerBook 1400 series computers' Floppy Disk Maker folder are the System disk images, both the Minimum and Full sets are the same.

Security: Everyone

Power Macintosh 7300 Series: Description (2/97)

Article Created: 24 January 1997
Article Reviewed/Updated: 13 February 1997

TOPIC -----

This article contains a description of the Power Macintosh 7300 series computers.

DISCUSSION -----

The Apple Power Macintosh 7300 series combines affordability, high performance, and upgradability to provide an ideal system for small and medium-size businesses, for home offices, and for running productivity applications in organizations of any size. Based on high-performance RISC technology, the Power Macintosh 7300 series models feature a 180- or 200-megahertz PowerPC 604e processor mounted on a removable card for easy and inexpensive upgrade to faster processor cards (as available).

The three industry-standard Peripheral Component Interconnect (PCI) high-performance expansion slots on the Power Macintosh 7300 series let you customize these computers easily to meet your needs more precisely. You can find PCI cards for a variety of uses, including graphics, storage, and high-speed networking. And if you want to use your Power Macintosh 7300 system to run MS-DOS and Windows applications as well as software written for the Macintosh, you can install a PC Compatibility Card from Apple in one of the system's PCI slots--and switch instantly between computing environments.

Connecting your Power Macintosh 7300 series computer to an Ethernet network is easy, because it includes both AAUI and 10BASE-T connectors. If you install an optional PC Compatibility Card, you can connect from both the card and the Macintosh logic board simultaneously, for incredibly versatile networking capabilities. And if you're interested in multimedia, you'll be glad to know that the Power Macintosh 7300 series features a 12x-speed CD-ROM drive.

Today, more and more computer users are discovering the wealth of information and communications resources and opportunities offered by the Internet. The

Power Macintosh 7300 makes it easy to get involved in this rapidly expanding community, because it comes with all of the software you need for easy Internet access--including the Apple Internet Connection Kit and America Online.

So whether you need power and expandability for everyday number crunching, office productivity, or an innovative multimedia project--or want a fast, easy way to get started with the Internet--the Apple Power Macintosh 7300 series computers offer the features you need, with room to grow at an affordable price.

Features

=====

High performance

- * 180-MHz or 200-Mhz MHz PowerPC 604e processor
- * Built-in floating-point processor and 64K cache
- * Standard 256K level 2 cache

Communications and multimedia

- * Two high-speed serial ports compatible with GeoPort and LocalTalk cables
- * 12x--speed CD-ROM drive
- * 16-bit stereo audio input and output
- * 64-bit VRAM subsystem

Expandability

- * Removable processor card allows easy upgrades
- * Three industry-standard PCI expansion slots
- * SCSI connector for hard disks, CD-ROM drives, and other SCSI devices
- * Internal expansion bay for additional 3.5-inch storage device
- * Up to 512 MB of RAM
- * Up to 4 MB of VRAM

Compatibility

- * Includes 10BASE-T and AAUI Ethernet connectors
- * Supports Open Transport networking software (TCP/IP and AppleTalk)
- * Runs 680x0 Macintosh applications as well as applications accelerated for Power Macintosh computers
- * Reads Mac OS, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats
- * Runs MS-DOS and Windows applications via either of two optional PC Compatibility Cards from Apple
- * Comes with all of the software required for Internet access

System 7.5.5 software

- * Makes working with different applications consistent, so they're easier to learn and use
- * Allows easy customization of your Macintosh to reflect the way you work
- * Provides active assistance in learning new features with Apple Guide

* Includes MacLinkPlus file translation software from DataViz

Ordering Information

=====

Power Macintosh 7300/166 (AVAILABLE IN EUROPE AND JAPAN ONLY)

Order No. M4946LL/A

* Power Macintosh 7300/166 computer with 16 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 2GB hard disk drive, and an internal 12x-speed CD-ROM drive. Includes keyboard and mouse; system software version 7.5.5 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Power Macintosh 7300/180

Order No. M5542LL/A

* Power Macintosh 7300/180 computer with 16 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 2GB hard disk drive, and an internal 12x-speed CD-ROM drive. Includes keyboard and mouse; system software version 7.5.5 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Power Macintosh 7300/200

Order No. M5543LL/A

* Power Macintosh 7300/200 computer with 32 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 2GB hard disk drive, and an internal 12x-speed CD-ROM drive. Includes keyboard and mouse; system software version 7.5.5 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Optional Enhancements

* GeoPort Telecom Adapter Kit

Order No. M5438LL/A

* PC Compatibility Card Solutions

- PC Compatibility Card with Pentium 100-MHz processor

Order No. M4092LL/A

- PC Compatibility Card with 100-MHz 586 processor

Order No. M4091LL/A

* Apple QuickDraw 3D Accelerator Card

Order No. M4333LL/A

Power Macintosh 7300 Series: Technical Specifications (2/97)

Article Created: 24 January 1997
Article Reviewed/Updated: 13 February 1997

TOPIC -----

This article contains the technical specifications for the Power Macintosh 7300 series computers.

DISCUSSION -----

Processor

=====

- * 180- or 200-MHz PowerPC 604e microprocessor
- * Integrated floating-point unit and 64K cache
- * Processor is mounted on a removable card for easy upgrades

Memory

=====

- * 16 MB or 32 MB of RAM, expandable to 512 MB via 8 DIMM sockets
- * 4 MB of ROM
- * Standard 256K level 2 cache

Disk drives

=====

- * Internal 2 GB Fast SCSI hard disk
- * Internal Apple SuperDrive floppy disk drive
- Accepts high-density 1.4MB disks and 800K disks
- Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- * Internal 12x-speed CD-ROM drive
- * Expansion bay for additional 3.5-inch hard disk

Interfaces

=====

- * Three PCI expansion slots compatible with PCI 2.0-compliant cards
- * Two high-speed DMA serial (RS-232/RS-422) ports compatible with LocalTalk and

GeoPort cables

- * 10BASE-T and AAUI-15 Ethernet connectors; optional PC Compatibility Cards provide multinode support for simultaneous network connections
- * Internal/external Fast SCSI bus (up to 10MB/s)
- * Apple Desktop Bus (ADB) expansion port
- * Mini jacks for stereo audio input and output
- 16-bit audio
- Up to 44.1-kHz sampling rate
- * DB-15 connector for monitor

Graphics support

=====

- * 2 MB of VRAM, expandable to 4 MB
- * 64-bit data path to VRAM
- * Support for display resolutions of up to 1,280 by 1,024 pixels
- * 24-bit color up to 1,024- by 768-pixel resolution
- * Refresh rate of up to 75 Hz

GeoPort telephony (Requires GeoPort Telecom Adapter)

=====

- * 28.8-Kbit/s modem support
- * V.17 fax support
- * GeoPort Fax and GeoPort Telephony software included
- * Speakerphone and answering-machine capability

Clock/calendar

=====

- * Custom integrated circuit with long-life battery

Keyboard and mouse

=====

- * Includes keyboard and ADB Mouse II

Electrical requirements and compliance

=====

- * Line voltage: 100 to 125/220 V AC, RMS single phase
- * Frequency: 50 to 60 Hz, single phase
- * Power: 150 W maximum, not including display

ADB power requirements

=====

- * Maximum current draw for all devices: 500 mA (a maximum of three ADB devices is recommended)
- * Mouse draws 10 mA
- * Keyboard draws 25 to 80 mA (varies with keyboard used)

Size and weight

=====

- * Height: 6.15 in. (15.6 cm)
- * Width: 14.37 in. (36.5 cm)
- * Depth: 16.93 in. (43.0 cm)
- * Weight: 22 lb. (9.97 kg)

Environmental requirements

=====

- * Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- * Storage temperature: -40 to 116 degrees F (-40 to 47 degrees C)
- * Relative humidity: 5% to 95% noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Power Macintosh 7600/200 Series: Description (2/97)

Revised: 2/13/97
Security: Everyone

Power Macintosh 7600/200 Series: Description (2/97)

=====

Article Created: 24 January 1997
Article Reviewed/Updated: 13 February 1997

TOPIC -----

This article contains a description of the Power Macintosh 7600/200 series computer.

Note: This product is available in Japan ONLY.

DISCUSSION -----

If you need a computer that offers increased performance and expandability for your business, the Power Macintosh 7600/200 is an ideal choice. With a 200-megahertz PowerPC 604e RISC processor on a removable card that can be easily swapped out for a card containing an even more powerful processor (as available), the Power Macintosh 7600/200 gives you all the advantages of PowerPC technology now—with plenty of room to grow later. Built-in video-input capability, high-resolution graphics, 12x-speed CD-ROM drive, and CD-quality stereo sound add new excitement to everyday business projects. And because the Power Macintosh 7600/200 optimizes the transfer of video data, it's an ideal system for videoconferencing.

The three industry-standard Peripheral Component Interconnect (PCI) high-performance expansion slots on the Power Macintosh 7600/200 let you customize this computer easily to meet your needs more precisely. You can find PCI cards for a variety of uses, including graphics, storage, and high-speed networking. And if you want to use your Power Macintosh 7600/200 to run MS-DOS and Windows applications as well as software written for the Macintosh, you can install a PC Compatibility Card from Apple in one of the system's PCI slots—and switch instantly between computing environments. In addition, connecting your Power Macintosh 7600/200 computer to an Ethernet network is easy, because it includes both AAUI and 10BASE-T connectors.

Today, more and more computer users are discovering the wealth of information and communications resources and opportunities offered by the Internet. The

Power Macintosh 7600/200 makes it easy to get involved in this rapidly expanding community, because it comes with all of the software you need for easy Internet access—including the Apple Internet Connection Kit and America Online.

Whether you are selecting a computer for a large corporation or a single-person home office, the Power Macintosh 7600/200 system offers PowerPC performance, upgradability, and advanced multimedia features to give you the versatility you need for professional computing.
